Introduction

Since the end of the Cold War, the concept of a Global North and Global South has arisen in the attempt to abandon former pejorative conceptualizations, such as First, Second, and Third Worlds and developed/underdeveloped countries (Altinbas, 2013; Shneider, 2017). In the Three-Worlds conceptualization, the First World referred to those countries with liberal, democratic, and capitalist governments and a high level of industrialization, the Second World was often used to represent communist countries with ties to the former Soviet Union and Russia, and the Third World was viewed as being composed of developing or underdeveloped states that are not aligned with the first or second worlds (Altinbas, 2013). This categorization fitted nicely into the era of the Cold War, as the primary antagonistic blocs of the West or First World and the East or Second World vied for hegemonic power, control, and influence over the non-organized Third World. This conceptualization lost relevance after the Cold War ended.

The global development architecture has metamorphosed, and today, the division of North/South is preferred terminology because it is less polemical, focusing on economic development levels rather than political ideology. While development aid flows have shifted and Southern countries are engendering novel cooperation and collaboration models, this newest categorization is far from flawless. As Jules and Moraes de Sá e Silva (2008) point out, the terms North and South are themselves Western constructs. Shneider (2017) argues that the concept of Global South still has similar problems as earlier terms such as of Third World or underdeveloped countries, the main problem being a persistent geographical understanding of the term and the oversimplification that comes from trying to fit the whole world in two categories. Through similar arguments, Chisholm and Steiner-Khamsi (2009) offer two clarifications to explain what it means to belong to the Global South. The first one is that belonging to the Global South does not necessarily imply being located in the South hemisphere. The second clarification is that the South is a relational concept used in opposition to the North. The term refers to a relationship of inequality, and “the notions of North and South have become a proxy or metaphor for rich and poor, developed and underdeveloped, First and Third World, givers and recipients of aid” (Chisholm and Steiner-Khamsi, 2009, p. 3). They further argue that the problem with this definition is its generality and oversimplification of how relationships between and within countries work. In Moraes de Sa e Silva’s (2009) words, “the problem is not so much with the terminology (South, developing countries, periphery), but rather with the assumption that the label implies homogeneity” (p. 54). To summarize, these conceptual difficulties mirror a more profound problem of power relationships between the Global North and the Global South, including their geopolitical and economic boundaries. These difficulties have led to South-South cooperation (SSC), a newer form of collaboration among developing countries that is based on equality, solidarity, respect, and complementarity. In this paper, we use SSC and South-South transfer interchangeably.

In what follows, we first discuss the difficulty in defining SSC. We show that SSC can be compared to triangular cooperation or North-South-South cooperation. Next, we review the literature that discusses the emergence of SSC and its three modalities, or phases, as described by Moraes de Sá e Silva (2009) (“self-reliance and political strengthening,” “demobilization,” and “best-practice transfer”). Third, we examine the role of SSC in education policy by looking specifically at how triangular cooperation has affected education systems in the Global South. With this objective in mind, we present a summary of the role of SSC in education policy across the Global South and discuss the role of the Sustainable Development Goals (SDGs), specifically Goal 4: on quality of education, in informing and facilitating educational transfer across Southern nations. While UNESCO and the SDGs are not direct tools of SSC, the alignment of goals that they provide as benchmarks promote and often facilitate educational transfer across the Global South. UNESCO encourages intervention in educational policy across borders in this way. This chapter, especially the third section, aims to present how SSC has impacted education in the Global South.

Toward a Definition of South-South Cooperation

The emergence of the Global South concept was in response to the steady rise of economies in the so-called Third World countries that began in the 1970s (Shneider, 2017). This rise meant that the previous categorization that placed Southern countries under the subordination of Northern countries was no longer useful. However, this concept of subordination has come under scrutiny in recent years as

developing countries and civil society have repeatedly criticized the way aid is often used as a neo-colonial tool by developed countries—imposing policy conditionalities on developing countries and trying to aid commercial, political and military interests of donors.

Reality of Aid Management Committee (2010, p. 2)

Given this, the concept of the Third World was not adequate to represent the new joint efforts of previously colonized nations to lift themselves up and stand against Western hegemony.

It has been and continues to be incredibly hard for developing countries to lift themselves from poverty and colonial dependence. This incapacity has been explained through a number of related theories, including Dependency Theory, World-System Analysis (WSA), and the Theory of Unequal Exchange. Immanuel Wallerstein (1930–2019) has been a critical figure in the development of WSA, a more comprehensive theory that is based on Dependency Theory. In Griffiths' (2021) words,

like dependency theory, WSA argues that the economic structures of so-called underdeveloped countries should not be understood as being in the early stages of a linear and universal transition to industrialization and development, but rather as “the result of being involved in the world-economy as peripheral, raw material producing area.” (p. 91)

Similarly, regarding the Theory of Unequal Exchange, Dargin (2014) states that “unequal exchange occurs when developing countries trade low-priced products (e.g., bananas, cocoa, and oil) for expensive manufactured goods (e.g., cars and computers)” (p. xxi). This theory upholds that the global market is, in reality, an exploitive trade system, as all exchanges between the peripheral and core countries in this market result in wealth transfer from the periphery to the core (where the peripheral countries are seen as the developing and under-developed countries, and the core the developed countries). In other words, “the proponents of the Theory of Unequal Exchange concluded that, in the face of uneven economic development, and for a variety of other reasons, free trade, or even trade per se, is inherently iniquitous” (Dargin, 2013, p. xxii). In the twentieth-century, two Argentinian economists, Raúl Prebisch (1901–1986) and Hans Signer (1910–2006), broadened this theory and suggested that primary-product-producing countries were going to decay more and more because primary products were condemned to a long-term and non-stop price degradation (Dargin, 2013).

This realization and the subsequent efforts of the Global South to revert their unprivileged standing in global trading did not by itself lead to the “Rise of the Rest.” The actions of the Global North were equally significant in this process. The USA, for instance, believed that enhancing the economic development of its allies was important, especially as a way to prevent communist ideologies from expanding. American policies also boosted the expansion of China; in their intent to fight the Soviet Union, “the highest levels of US policy making decided to open up China in order to contain the Soviet Union” (Dargin, 2013, p. xxiii). A third example is the movement of manufacturing centers from the USA to Southern countries, which occurred because of the increase of work stoppages in American factories. In order to make more profits in relation to production costs, big corporations decided to move their production to countries with cheaper labor (Dargin, 2013). In this context SSC, and particularly triangular cooperation which involves three actors—two from the South and one from the North or an international organization—became the main instrument for the Global South's economic and political flourishing. After the concept of the Third World was phased out by the term South or Global South, every sort of collaboration among countries in the South began to be called SSC (Jules and Morais de Sá e Silva, 2008).

SSC is “any cooperative initiative between two or more developing countries; it may be carried out by governmental institutions, non-governmental organizations, universities, independent professionals, scholars and researchers” (Morais de Silva, 2009, p. 2). UNESCO (2019) defines SSC as an “exchange of knowledge and resources between governments, organizations and individuals in developing countries, or those from what is known as the Global South” (para. 1). Triangular cooperation or North-South-South cooperation is a form of collaboration within SSC. Abdenur (2009) defines triangular cooperation as

the initiative of one or more southern countries that wish to cooperate with one another. In order to maximize their financial, logistic and technical resources, such countries can ask for the support of a Northern donor as a third partner. Alternatively, a donor can partner with a developing country willing to provide technical cooperation to other Southern partners and whose initiative will make triangular cooperation the Northern donor's priorities and interests. The Northern donor would then offer to support South-South cooperation through a triangular approach by providing financial and/or technical support. (pp. 158–159)

Other forms of cooperation include bilateral SSC (which is government-to-government cooperation between developing countries), triangular SSC (where the financial supporter, the donor, and the recipient are developing countries), triangular multilateral SSC (where a multilateral organization works as the financial supporter for two developing countries), and regional SSC (which is the cooperation between two regional organizations formed by developing countries) (SEGIB, 2008, 2009, 2010). In this chapter, however, we treat SSC and triangular cooperation as one, given that donors from Northern countries, including developed countries themselves, non-governmental organizations (NGOs), and individual philanthropists, play an essential role in enhancing and functioning cooperation among and within developing countries, especially in education matters. In fact, many collaborations and policy transfers among countries in the Global South stem from international agreements and are regulated by the donors' benchmarks. Steiner-Khamsi (2009) argues that "South-South transfer is currently central to the operations of international donors" (p. 256). A clear example is the Education for All-Fast Track Initiative (EFA-FTI), launched in 2002 as a partnership between the donor and developing countries, connecting donors with low-income countries (named "partner countries") to help them achieve the education goals established in the United Nations' Millennium Development Goals (MDGs) agenda. Through the EFA-FTI, donors and the World Bank gave financial support to those low-income countries for whom donors' help was not enough to achieve the needed improvements. To become a partner country and matching with a donor, countries were required to have a poverty reduction strategy and a sound education sector plan that included borrowing educational practices from comparable educational systems.

SSC has received a lot more attention in the past decades since some developing countries became crucial actors in the world economy. In 2010, for instance, "the so-called BRICs economies—Brazil, Russia, India, and China—with 40% of the world's population spread out over three continents, already account for 25% of the global gross domestic product (GDP)" (*The Reality of Aid Management Committee*, 2010, p. 1). However, as Bilal (2012) explains, the rise of the Global South did not happen evenly across Southern countries. Most of the growth of GDP in the Global South is due to the development of the BRICs countries, especially Asian countries. Asian developing countries represented around 10% of the world economy in 1990, and in 2016 they reached approximately 30%. In contrast, Latin America and the Caribbean decreased their GDP representation from 9.5% in 1990 to 8.5% in 2012 (Bilal, 2012). Additionally, there are also significant disparities within countries in each continent. As Bilal (2012) points out, "optimism about the South, its economic development and the growing importance of South-South relations should not blind us to this strongly uneven process between and within countries, and the serious poverty challenges that the South is still confronted with" (p. 11).

Nevertheless, economic development is not the only goal of cooperation and partnership among the Global South. Political strategies are as important as economic growth. The multidimensional character of SSC, which includes economic, political, and social aspects in its cooperation agreements, is a crucial attribute of this type of relationship between countries. As Bilal (2012) states, "the focus on mutual learning and exchanges on good practices, without promoting a certain model of development and imposing a set of policy recommendations, has been particularly appreciated by developing countries" (p. 22). This is the reason why SSC has become a fundamental feature in the rise of the Global South. As Gray and Gills (2016) explain,

development is a concept that attempts to encompass a vast complexity of processes of social transformation. It conveys meanings of great promise and hope to billions of human beings concerning human betterment, and refers to a long-term historical project of the liberation of peoples and nations from the vestiges of colonialism, poverty, oppression and underdevelopment. South-South cooperation (SSC) has been a key organizing concept and a set of practices in pursuit of these historical changes through the vision of mutual benefit and solidarity among the disadvantaged of the world system. It conveys the hope that development may be achieved by the poor themselves through their mutual assistance to one another. (p. 557)

Jules and Morais de Sá e Silva (2008) also highlight the importance of SSC in postcolonial studies, arguing that SSC and transfer are an essential part of the decolonization process helping "developing countries decolonize their educational systems and break their dependency from educators, researchers and scientists from the North" (p. 57).

Historizing the Origins of South-South Cooperation

Given the status of SSC as a consequence of the Cold War, its origins are generally thought of in that era. While SSC existed before the 1950s in more informal and non-institutionalized ways, it was the 1955 Conference in Bandung, Indonesia, that is undoubtedly considered a landmark in SSC development and its transformation into a global political movement (Gray and Gills, 2016). Caruso (2009) offers an example of SSC as far back as the end of the 1800s, when different Spanish colonies across Latin America started to transfer the Bell-Lancaster-System educational model that emerged in Cadiz, Spain. Steiner-Khamsi (2009) also believes SSC dates back to the colonial period. Despite this, Morais de Sá e Silva (2009) places the emergence of SSC around the 1950s, during the Cold War period, and differentiates three historical phases in the development of SSC, discussed in depth below.

As an institutional entity, SSC is realized through principles of cooperation and interconnectedness. Bilal (2012) states that SSC is guided by certain principles that all countries in the Global South share

South-South cooperation, its agenda, and development objectives should be set by countries of the South. It should not be driven by charity and power/dependency relationships. On the contrary, it claims to be based on the principles of equality, solidarity, the respect of national independence and ownership, mutual benefits (promoting win-win outcomes) and complementarity. The principle of non-interference in domestic affairs is key. (p. 22)

Non-interference as a principle is one of the cornerstones of SSC, as “South-South cooperation on development aims to observe the principle of non-interference in internal affairs, equality among developing partners and respect for their independence, national sovereignty, cultural diversity and identity and local content” (*The Reality of Aid Management Committee, 2010*, p. 2). Though this description of SSC, as one of mutual cooperation and respect, seems appealing, the reality is more complex, and there are also multiple disadvantages. For example, the Bretton Woods institutions (specifically, the International Monetary Fund (IMF) and the World Bank) launched Structural Adjustment Programs (SAPs) in the 1980s with global prescriptions aimed at improving international competitiveness, adjusting countries’ economic structures, and restoring their balance of payments. These measures would push developing countries toward exploring deeper forms of Southern cooperation. Countries failing to enact SAPs, whose terms and financial institutions determined conditions, faced fiscal discipline. This would lead to the erosion of national control of the economy and open it up to interference from foreign markets. For instance, in 1988, the World Bank noted that its SAPs placed nations at “risk of ‘ceding national sovereignty’ to transnational firms whose main interests are the perpetuation of unequal distribution of value added from the fruits of export manufacturing” (Mills, 1989, p. 28). Therefore, despite a lack of direct interference, inequality was nevertheless further perpetuated. This is because “SSC as an organizational medium rest on two pillars: political and economic. Any conceptual separation of these pillars is difficult because the two separate arenas are actually interconnected” (Altinbas, 2013, p. 34). With this understanding, “non-interference” during SSC is a paradox; there will always be an imbalance.

The Three Historical Phases in the Development of SSC

The First Phase

In the aftermath of the Cold War, countries in the Global South were predisposed to avoid conflict by any means; they likely understood they could not withstand the same economic devastation that had befallen Europe. Many were also newly decolonized and looking to attain financial independence as well. Much of SSC begins with the anti-colonial movement, “fueled by strong political motivations and practiced by autonomous militants or officially provided by socialist countries” (Morais de Silva, 2009, p. 2). The first phase of South-South transfer began with the solidifying of the concept of “underdevelopment” by the American President Harry Truman in a 1949 speech, wherein he introduced the Four Point Plan, “a bold new program for making the benefits of our scientific advances and industrial progress available for the improvement and growth of underdeveloped areas” (Truman, 1949). Truman’s Four-Point Plan would solidify the concept of “underdeveloped countries” as a homogenous group and create an identity that promoted SSC, given that “the creation of a Third World identity and the image of an in-between block created the conditions for the establishment of an alliance between countries that were—and still are—quite heterogeneous” (Morais De Silva, 2009, p. 8).

While SSC has been practiced informally for centuries, the defining entry point to institutionalized SSC is the 1955 Bandung Conference, which “brought together 29 countries from Asia and Africa to promote economic and cultural cooperation in the Asian-African region ‘on the basis of mutual interest and respect for national sovereignty’” (*The Reality of Aid Management Committee, 2010*, p. 2). After the Bandung conference, “developing countries proposed to build a new international partnership for development on the basis of respect for national sovereignty, equality and mutual benefit” (Cui, 2016, p. 2). This led to the Non-Aligned Movement (NAM) in 1961, the United Nations Development Program in 1965, the Group of 77 in 1967, and the 1978 conference of the Global South held in Buenos Aires, which resulted in the Buenos Aires Plan of Action. The Buenos Aires Plan of Action saw delegates from 138 states adopting the Plan of Action for promoting and implementing Technical Cooperation among Developing Countries (TCDC), which was seen as a blueprint for major changes in approaches to development assistance and called on parties to establish a new international economic order based on the pooling of knowledge.

From the outset, SSC was self-deterministic and anti-interventionist. As Gray and Gills (2016) point out, “the ‘Bandung Spirit’ came to encapsulate policies of non-interference and non-alignment, with the Non-Aligned Movement (NAM) further developing this solidarity to challenge the deepening global inequality while lessening the Third World’s economic and political dependence on the Global North” (p. 558). The “Bandung Spirit” was “an ideology that tried to merge Asian and African nationalism, religion, and humanity” (Widyatmadja, 2005). Realizing their strength in numbers in voting blocs, countries started to consolidate for multilateral negotiations, with leaders such as India’s Jawaharlal Nehru, Tanzania’s Julius Kambarage Nyerere, and China’s Mao Zedong jockeying for leadership roles within these collectives; for example, Mao tried to unite this “Trade Union of the Poor” under his “Three World Theory ... [with] China in the center of the South from where the anti-imperialist struggles against the richer nations were to be orchestrated” (Morais De Silva, 2009, p. 10). Even though little was achieved in terms of creating the desired New International Economic Order, economic integration, military cooperation, humanitarian aid, and technical assistance soared during this time, and since then, “South-South cooperation has been practiced in numerous ways ranging from economic integration,

the formation of negotiating blocs within multilateral institutions, military alliances, [to] cultural exchanges ... these efforts have made important contributions to strengthening the conditions for social and economic development" (*The Reality of Aid Management Committee*, 2010, p. 2). In short, the 1960s and 1970s saw leaders in developing countries looking for alternatives to the existing economic and political order of a bipolar Cold War era. As such, they embarked upon technical cooperation among themselves.

The Second Phase

From 1980 to 1998, there was a demobilization period due to debt crises and SAPs. While Global South countries had benefited from Bretton Woods loans, soaring interest rates during Reaganomics created an economic crisis in Latin American countries, with high recession and inflation leading to the 'lost decade.' Given this situation, "the idea of different states engaging in the generation of a New International Economic Order made no sense vis-à-vis the preached argument that the market was the one to tell what kind of economic order was to prevail" (Morais De Silva, 2009, p. 38) and as states focused inwardly on domestic affairs, "with the outbreak of the debt crisis, the poverty related aid gradually reduced and more and more assistance began to be used for privatization and structural adjustment" (Cui, 2016, p. 2).

Much of the demobilization was in response to the rise of the ten market prescriptions of the Washington Consensus, which obligated neoliberal reforms as part of the SAPs. Intergovernmental organizations "no longer counted on the political mobilization of governments of the South, nor on the advocacy of specialists who defended the view that South-South trade was the way forward" (Morais De Silva, 2009, p. 16) since individual states were now focusing on integrating into the global economy rather than attracting regional South-South investment. This led to the renewed influence of the "First World" countries; for example, the World Bank noted during this time that "African policymakers perceive the staff of international organizations as promoting the view that right-minded policy is a matter of 'macho-political will'" (Mills, 1989, p. 2). The Washington Consensus had indirectly opened up labor markets in Southern countries thanks to the removal of trade barriers, and it was soon noted that "there is a need to analyze the advantages and the disadvantages of structural adjustment policies from the point of view of gainers and losers the Bank has a tendency ... to see more clearly the positive (economic) aspects of reform and to minimize the social and political risks" (Mills, 1989, p. 12).

The Third Phase

With the creation of a public international organization—the Global Development Network (GDN), which was created in 1999² and aims at using research to promote better lives in developing and transitioning countries—SSC has entered a new phase characterized by a reversal in the trade liberalization of the previous decades. Between 2006 and 2016, GDN's focus was on enhancing cooperation with regional networks globally. From 2017 to 2022, its current strategy highlights three areas: (i) strengthening research in low-capacity environments; (ii) joining hands for global excellence; and (iii) putting development research to better use as part of its focus. In the modern era, SSC is shifting in how it is approached, as the appeal is no longer limited to developing countries but also to international entities such as knowledge banks who seek the promotion of "best practices," hence, this can be referred to as the "Best Practices phase." This concept is the cornerstone of the GDN, which was created to foster the transfer of "best practices" between underdeveloped countries. As it became clear that SAPs were only leading to rising costs and high unemployment, Global South countries mobilized economically, first through the World Trade Organization (WTO) and later at the G8³/G20⁴/GX⁵ conferences. This has led to "a rapidly expanding South-South trade, investment, and cooperation in a growing variety of fields—including regional economic integration, national security, health and the environment—rest primarily on the increasing competitiveness of Southern countries in world production" (Arrighi and Zhang, 2011, p. 33).

The new century led to an increase in up-and-coming economies that were relying on promoting SSC and which would encompass new features, including "a number of new development finance institutions led by developing countries" (Cui, 2016, p. 2). This is a significant reversal from the era of the SAPs, and now the "Washington Consensus ... has backfired, creating conditions of a reversal of power relations between the global North and South that may well be reshaping world politics as well as the theory and practice of national development" (Arrighi and Zhang, 2011, p. 1). In a way, it has come full circle to the antagonism of the first phase, as leftist governments (especially in Latin America) returned to people-centric policies.

²The agreement was signed by Colombia, Egypt, India, Italy, Senegal, and Sri Lanka.

³Group of Eight (G8) refers to the group of eight highly industrialized nations—France, Germany, Italy, the United Kingdom, Japan, the United States, Canada, and Russia—who meet yearly at an intergovernmental forum from 1997 until 2014 to discuss international issues. Today it is the G7 as Russia was suspended. At times we speak of the G8+5 where the five leading emerging markets—Brazil, China, India, Mexico, and South Africa—are invited to participate in G7 meetings.

⁴Built as the premier forum for international cooperation, since 1999, the G20 brings together the world's major economies whose members account for more than 80% of world's Gross Domestic Product (GDP), 75% of global trade, and 60% of the world's population. Its participants are Argentina, Australia, Brazil, Canada, China, France, Germany, Japan, India, Indonesia, Italy, Mexico, Russia, South Africa, Saudi Arabia, South Korea, Turkey, the United Kingdom, the United States, and the European Union. Spain is invited as a permanent guest.

⁵The Group X (or 10), not to be confused with the Groups of 7, 8, 20, or 24, consists of a group of 11 countries with similar economic interests who consult each other and cooperate on international financial matters. They are Belgium, Canada, France, Germany, Italy, Japan, the Netherlands, Sweden, Switzerland, the United Kingdom, and the United States, with Switzerland playing a minor role.

the Southern countries' hostility is not against globalization or capitalism, because they use each of these processes and systems to their own advantages. Their reaction is against a capitalist system that somehow designates them as perennial losers and against global trade policies that deprive them of influence. Their goal is not to change the system completely but to make the system more inclusive.

Altınbas (2013, p. 59).

International agencies now act as conduits for the transfer of South-South practices, since "the real significance of South-South development cooperation (SSDC) lies not so much in the magnitude of official development assistance (ODA) or financial resources flowing between developing countries but rather in the character of the relationship expressed by these exchanges" (The Reality of Aid Management Committee, 2010, p. 1).

South-South Cooperation and Education Policy

SSC is about technical cooperation, knowledge and resources transfer, and innovative knowledge exchange between developing countries in areas to share knowledge. When development became more than just economic growth and started to encompass other aspects such as freedom, empowerment, and citizens' well-being, education became a key area of development strategies. Therefore, education became central in any SSC initiative (Morais de Sá e Silva, 2009). SSC in education has not always involved the mediation of third parties, such as international organizations or Northern countries. This means triangular cooperation was not, and it is not the only form of SSC in education. The forms of cooperation that do not include mediators that serve as financial supporters are bilateral South-South, triangular south-south-south, and regional South-South cooperation (SEGIB, 2008, 2009, 2010). An example of a non-mediated SSC in education is the case of the *¡Yo, Sí Puedo!* (Yes, I can) literacy method further explained below. This educational initiative emerged from the South (Cuba) and was transferred to numerous other Southern countries as a successful way to fight analphabetism.

However, since the 1990 Jomtien Education for All (EFA) conference, SSC in education has become more and more mediated by international organizations and powerful "donor" states. In this conference, countries worldwide agreed that education is critical for development and poverty reduction (Samoff, 2009). However, education also started to be seen as a unique area for foreign aid as it enables donors' control over knowledge. Samoff (2009) defines foreign aid as a "tool" or "set of tools," as "managing transfers and exchanges means not only supporting schools and learning but also managing the flow of ideas and the accepted procedures for validating knowledge" (p. 125). He continues by saying that "understood in this way, the aid relationship clearly has the potential to extend rather than eliminate poverty and to entrench and institutionalize rather than reduce global inequalities" (Samoff, 2009, p. 125).

The EFA strategy designed in the Jomtien conference significantly exposes the huge expectations in the role of SSC or triangular cooperation in helping reach educational benchmarks across the Global South. Morais de Sá e Silva (2009) explains how SSC for EFA promotion has been specially designed and executed by the Group of E-9 countries,⁶ which represents some of the largest education systems in the world and over half of the world's population:

E-9 countries have not only been recognized as crucial places for the promotion of universal quality education; they have also demonstrated internal capacity to design efficient EFA programs. They are, therefore, seen as important "reference societies" for other developing countries and, by means of South-South cooperation, their nationally engineered programs can be spread to other places counting on UNESCO's facilitation. (pp. 51–52)

As suggested here, the concept of SSC in education today mainly entails policy transfer of international "best practices" that can lead to educational development as defined by the Global North. This intention behind SSC has changed the nature of collaboration across the Global South. For example, during the first phase of SSC, the foremost advocates of cooperation among the South were the same Southern countries. Today, in contrast, "South-South cooperation has, to some extent, escaped the 'hands of the South'" (Morais de Sá e Silva, 2009, p. 53), meaning that it is in the interest of Northern governments and international organizations, especially international knowledge banks. Another critical change is the motivations. Even though the original aims of the Global South to gain autonomy and international power are still important, SSC has been focusing much of its energy on expanding "best practices" and meeting global development benchmarks. A last change to highlight is how increasingly blurry the concepts of North and South have become, given the growing inequalities and differentiation among countries in the so-called Global South (Morais de Sá e Silva, 2009).

In some of these "best policy" transfers, the principles of SSC mentioned above can be seen as being facilitated by international knowledge banks. UNESCO has aligned many of its policy goals with the principles of SSC. For example, its Malala Fund for Girls' Right to Education has the core goals of "expand[ing] access to education for girls and women, especially those hardest to reach and affected by conflict and disaster" (UNESCO, 2020, para 1), which aligns with the principles of equality and solidarity, while implementing programs that train teachers directly, without attempting to sway internal policy. In terms of non-interference, the

⁶E9 countries are Bangladesh, Brazil, China, Egypt, India, Indonesia, Mexico, Nigeria, and Pakistan.

motivation of SSC to expand best practices across the Global South has darkened this principle, as benchmarking is creating indirect governance by Northern countries, international institutions, and international knowledge banks.

Considering that donors from the North and international knowledge banks regulate SSC in education development, several scholars wonder whether SSC is really “a way out from the dependency track in educational development” (Steiner-Khamsi, 2009, p. 257). This begs the question, are there any educational policies really emerging from the Global South and regulated by it? Or is SSC in education just a way to hinder the persistence of Western hegemony over educational practices worldwide? As Steiner-Khamsi (2009) states, “South-South cooperation can be seen as a vehicle to accelerate the accomplishment of development targets established by the North” (p. 257).

In addition, countries in the North have become involved in triangular cooperation to play a role in international development cooperation or official development assistance (ODA). They participate actively in this role, as appearing as a great global donor increases countries’ legitimacy as powerful and influential. Mochizuki (2009) presents the case of Japan, which became one of the largest donor countries, aiding developing nations in both Asia and Africa as “a new aid scheme that would allow it to achieve its broader goals in foreign relations, including attaining the UN Security Council permanent membership” (p. 81). Getting involved in SSC or, more specifically, triangular cooperation, became a strategy used by Japan to “establish itself as a ‘first class’ developed country in the international community” (Mochizuki, 2009, p. 81).

South-South Cooperation, Transfer, and the Sustainable Development Goals

This section looks at educational SSC in the context of the SDGs, which provides an external series of benchmarks that helps align SSC. With its use of political dialogue and financial cooperation, SSC has contributed significantly to shaping the 2030 Agenda for Sustainable Development. Education plays an essential role in achieving many SDGs, and SDG 4 aims to promote lifelong learning opportunities for all while ensuring inclusive and equitable, quality education. Global education is the pivot point for it. SDG 4 is comprehensive; it expands from early childhood education through basic education to vocational and secondary education and lifelong learning. The idea of “lifelong learning for all” is a crucial element of SDG 4. SDG 4 has 10 targets⁷ which are measured by 11 indicators. These 10 targets are considered the backbone of Global Campaign for Education (GCE)’s policy and advocacy work since 2015.

UNESCO has a crucial role in promoting triangular cooperation in educational matters by strengthening cooperation between developing countries and attracting donors (developed countries or NGOs) who affect SSC. As part of its mission statement, UNESCO (n.d.) calls for “cooperat[ion] with Member states, civil society, and the academic world [to] promotes public-private partnership in education” (para. 4). Some examples of educational projects run by UNESCO that promote SSC are: (i) the Capacity Development for Education Program (CapED) created in 2003 and modified in 2016, and is aligned with the SDG 4—Education 2030 agenda to offer quality education opportunities for all (ii) the Enhancing Teacher Education for Bridging the Education Quality Gap in Africa project, which is funded by the Chinese government and uses information communication technologies to enhance teacher training; (iii) UNESCO’s Malala Fund for Girls’ Right to Education, which was established in 2012 to increase girls’ access to quality and gender-responsive education and ensure safe learning environments; (iv) Youth Employment in the Mediterranean Project (YEM), which is funded by the European Union and implemented between 2018 and 2020 and addressed issues of youth employment; (v) Best Practices in Mobile Learning, launched in 2016, as a 5-year program, with support from the Fazheng Group, seeks to create equitable learning environments through school-wide planning and use of mobile learning. There are many more programs that UNESCO runs under the banners of capacity development, teacher education, girls and women’s education, technical and vocational education and training, and ICT in education.

Although all 10 SDG targets are important to consider when talking about education in relation to SSC, four targets are more relatable in this context:

- Goal 4.3: By 2030, ensure equal access for all women and men to affordable and quality technical, vocational and tertiary education, including university.
- Goal 4.4: By 2030, substantially increase the number of youth and adults who have relevant skills, including technical and vocational skills.
- Goal 4.5: By 2030, eliminate gender disparities in education and ensure equal access to all levels of education and vocational training for the vulnerable, including persons with disabilities, indigenous peoples and children in vulnerable situations.
- Goal 4.6: By 2030, ensure that all youth and a substantial proportion of adults, both men and women, achieve literacy and numeracy.

⁷These 10 targets are broken down into seven outcome targets and three means of implementation. The seven outcome targets are (i) universal primary and secondary education; (ii) early childhood development and universal pre-primary education; (iii) equal success to technical/vocational and higher education; (iv) relevant skills for decent work; (v) gender equality and inclusion; (vi) universal youth literacy; and (vii) education for sustainable development and global citizenship. The three means of implementation are: (i) effective learning environments; (iii) scholarships, and (iii) teachers and educators.

According to Groenez et al. (2007) and Blossfeld et al. (2014), a correlation exists between education participation rates and governmental investment in industries, innovation, and infrastructures. This justifies the idea of education being used as a powerful “tool” to develop a more inclusive and equal society.

With the introduction of the SDGs, we can see SSC educational transfer aligning with the SDGs; in particular, Goal 4. Goal 4 of the SDGs integrates within UNESCO’s earlier EFA project, which had six specific goals, including “achieve[ing] a 50% improvement in adult literacy by 2015, especially for women, and equitable access to basic and continuing education for all adults” (World Bank, 2014, para 5) which matches Goal 4.6, and “eliminate gender disparities in primary and secondary education by 2005 and achieve gender equality in education” (World Bank, 2014, para 6) which matches Goal 4.5. With overlaps such as these occurring in congruent SSC education goals, a stronger picture emerges of the direction between triangular cooperation donor countries want to align their efforts.

We can see various SSC initiatives aligning with SDG 4, both directly and indirectly. China has committed to aligning its Belt and Road Initiative (BRI), which focuses on infrastructure development predominantly in the Global South, with the SDGs, including Goal 4. For instance, the “BRI conceptualizes an education community as a multicultural group that transcends geographical, cultural and linguistic boundaries, while considering common interests and common responsibilities as the core foundation on which equality and respect are built” (Peters et al., 2020, pp. 1044–1045) and “both are committed to promoting inclusive and sustainable economic growth and social development; the BRI’s vision to realize diversified, independent, balanced, and sustainable development in the countries along the BRI echoes the sustainable development goals set out in the 2030 Agenda” (Yin, 2019, p. 8). While not referencing this SDG specifically, the United Arab Emirates has also been aligning its SSC funding toward cohesion with the SDGs; for example “in 2016, 76% of the UAE foreign assistance supported the eight SDGs highlighted in the UAE Foreign Assistance Policy” (Khalid, 2018, p. 456), while benchmark 4.4 neatly matches the UAE’s goal to “create and strengthen existing technological capacities ... in order to improve the effectiveness with which such capacities are used and to improve the capacity of developing countries to absorb and adapt technology and skills to meet their specific developmental needs” (Khalid, 2018, p. 454) in their development aid. Meanwhile, in Japan, education funding matches 4.3 when “the 1999 Medium-Term Policy on ODA also stated that Japan would focus on the ‘quality,’ rather than quantity, of aid activities in the promotion of its ODA” (Mochizuki, 2009, p. 10) to developing countries, as well as the promotion of basic literacy

a dramatic shift of focus from higher education and technical and vocational education in Asia to basic education in Africa was an integral part of Japan’s new ODA strategies aimed at enabling Japan to play a more central role in international development cooperation.

Mochizuki (2009, p. 11).

It is clear that in broad terms, at least, SDG 4 is guiding SSC development.

Through its own donor-funded arms, the UN coordinates much of the alignment of SSC with its own SDGs. For example, in 2015, it is the Addis Ababa Action Agenda, which “brought together over 1.5 trillion for education and skills development infrastructure by consolidating funds from AIIB, the Global Infrastructure Hub, the BRICS NDB, the Asia Pacific Project Preparation Facility, the World Bank Group’s Global Infrastructure Facility” (UNOSSC, n.d., p. 139). The UN’s Science, Technology, and Innovation Strategy for Africa (STISA) “have already decided to support capacity-building efforts in education and research across Africa through the creation of scientific centers and networks of excellence and the upgrading of both research and teaching at universities” (UNDP, p. 18). Moreover, in Bangladesh, “BRAC recruited a village woman with eight or more years of education to serve as para-professional teachers for 3–4 h per day for a small stipend” while “a School Management Committee (SMC) selected the times and days the school would meet according to the needs of the parents” (Chabbot, 2009, p. 3). By using its donor apparatuses to engage in triangular cooperation, the UN is positioning the SDGs as a driving force across SSC development.

The case of the ¡Yo, Sí Puedo! ([YSP] *Yes, I can*) literacy method, designed by ALBA-TCP (Bolivarian Alliance for the Peoples of Our America—Peoples’ Trade Treaty), is an example of where we can see SDG 4 in a specific SSC initiative. The ¡Yo, Sí Puedo! program was designed in the 2000s by the Cuban educator Leonela Relys Diaz, to expand basic literacy among people of all ages. From 2001 onwards, YSP started to be employed in numerous countries in the Global South, gaining a honorable mention in UNESCO’s international Literacy Prize (Boughton and Durnan, 2014; Muhr, 2015). Boughton and Durnan (2014) define YSP as “a model for mounting low-cost mass adult literacy campaign across regions and countries, involving extensive coordination and mobilization of all the relevant government and non-government agencies and actors and the population as a whole” (p. 327). The objectives of this program, therefore, are very much in line with the goals of the SDG 4, quality of education, in that it has enhanced literacy among millions of adults (in line with goal 4.6), promoting long-life learning opportunities (one of the critical components of goal 4). Especially the ¡Yo, Sí Puedo Seguir! (*Sure, I can continue*) focuses on ensuring literacy for all throughout life. As Muhr (2015) explains

by late 2014, 3,815,092 people of all ages (meaning that no particular group age is targeted) are officially stated to have acquired basic literacy through ¡Yo, Sí Puedo! associated literacy campaigns in the alba-tcp member territories, and 1,174,312 have completed post-literacy non-formal elementary education ... by late 2014, 8,203,324 people had acquired literacy through ¡Yo, Sí Puedo! worldwide, and over one million have benefited from ¡Yo, Sí Puedo Seguir! (p. 128)

In the last 15 years, the program has reached 29 countries, and it has made basic literacy accessible to more than six million people, mainly in the Global South. However, as [Muhr \(2015\)](#) and [Boughton and Durnan \(2014\)](#) highlight, the program has not been significantly noticed and studied in the Global North. In addition, it works by bringing together multiple actors in collaboration. In fact, this literacy campaign that emerged in the Global South was only able to function thanks to the joint efforts of two of ALBA-TCP's founding members, Cuba, and Venezuela, guided by the SSC principles of complementarity, solidarity, and cooperation.

[Muhr \(2015\)](#) argues that “the case of ¡Yo, Sí Puedo! should not be regarded as ‘best practice transfer’ among developing countries, but as integral to South-South cooperation as a collective counter-hegemonic process of Third World liberation and emancipation for structural transformation toward a socially just and democratic world order” (p. 126). Counter-hegemony is part of SSC's motivations and ideas, representing the aims of the Global South to gain economic independence from the Global North and overcome their “under-development.” The counter-hegemonic process emerged at the same time as SSC, in the 1955 Bandung conference, and acquire strength with the foundation of the Non-aligned Movement (NAM), the foundation of the G-77 Group (now composed by 134 developing countries), and the 1978 Buenos Aires Plan of Action for Promoting and Implementing Technical Cooperation among Developing Countries (BAPA), signed by 138 UN members. The BAPA is unique in that it was the first framework to incorporate this type of cooperation and called for respect for sovereignty, non-interference in internal affairs, and equality of rights, among others. The YSP literacy method promoted by ALBA-TCP, which became global, is critical because it represents the counter-hegemonic efforts that started to emerge from the SSC and the role of education in this process. In [Muhr's \(2015\)](#) words, YSP

does not limit itself to learning to read and to write only. It goes much further. It pursues a conscientising and transformatory literacy, besides schooling ... It has as its fundamental objective the active insertion of the participants in the social, economic and political activities of the community and the countries in which they live. (p. 130)

In this way, YSP contests the “new global governance of education” ([Muhr, 2015](#), p. 132), as it does not focus on transferring “best practices” nor involves any type of conditionalities or coercion from tertiary parties. It is a program based on voluntary participation and, therefore, a real example of pure SSC that is engendered within and strengthens the Global South.

Conclusions and Further Research

This chapter has presented SSC in the arena of education. After providing the theoretical lens of SSC, it has charted the history of SSC, from its decolonial origins through its three phases of development since the Cold War. It then provided examples of how SSC, through the guidance of the UN, aligned with SDG 4. Finally, it presented a practical model of educational SSC transfer that is likely informed by SDG 4. While North-South cooperation is the orthodoxy, SSC is used among countries that share similar historical realities and similar challenges. SSC has contributed to many knowledge exchanges through programs, projects, and initiatives that have helped solve challenges faced by Southern countries.

While SSC can spur educational development in countries, the educational arena it operates in is still highly postcolonial and Western-oriented. SSC is affecting the hegemony of developed countries in the educational policy arena by realigning policies with Western notions of “development.” While “on the one hand, SSC is a multiregional initiative designed to reduce the South countries' economic dependency on markets in the North, ... on the other hand, SSC must necessarily involve changes in political dependencies” ([Altinbas, 2013](#), p. 58). As long as the UN is a significant donor arm in SSC coordination, there will be a political dependency on Western nations. While “SSC's ultimate goal is to close the socio-economic gap between the developed and developing countries, in any logic scheme, SSC should reduce the South's vulnerability to arbitrary or unilateral pressures from industrialized nations” ([Altinbas, 2013](#), p. 34). While SSC emphasizes equality and basic functional skills in the education arena, it is the international donors who define and delineate these concepts.

Future research can be informed by locating what is needed to revise the agenda that was set when EFA was introduced. We have moved into a post-knowledge economy where the agenda should focus on lifelong learning. It is time for the international community to convene again around the topic of SDG 4 and try to build consensus around what the next policy agenda framework would look like. Before the SDGs can become gospel, “triangular cooperation must overcome the challenges of high transaction costs, limited funds for projects, lack of trust between OECD DAC countries and their counterparts among emerging economies, and the possibility of adding to the already strained bureaucracies in the Global South” ([UNOSSC, n.d.](#), p. 136). The control of infrastructure development will set the stage for the next decade of educational reform in the Global South.

Introduction

While testing and using data to monitor student performance is not a new phenomenon, its current manifestation emanating from the Organization for Economic Co-operation and Development (OECD) and various national education systems corresponds with changes in the global education policy discourse that have placed greater emphasis on numbers, metrics and the promotion of an audit culture (Lewis, 2020; Lingard et al., 2016; Lingard, 2011; Rizvi and Lingard, 2010; Moreno-Salto and Robertson, 2021). To draw on the work of Shore and Wright (2015a,b), we are increasingly governed by numbers, indicators, and audits, and “to be audited and inspected is now regarded as an axiomatic part of personhood” (p. 23). This article foregrounds this policy shift in the significance of data and standardization and argues that this shift does not impact all students equally but has serious consequences for racialized students and students from low-income families. Moreover, it leads to further segregation of racialized students and, coupled with the mediatization of test data and ranking of schools based on test scores, testing has resulted in stigmatization, lower enrollment rates and closure of low-performing schools in certain racialized and poor neighborhoods.

This paper begins with an overview of the global context of testing and a discussion of the role international organizations such as the OECD play in steering education policy globally and nationally. This paper then proceeds to discuss the impact of neoliberal governance in driving national education systems toward datafication, accountability and comparisons with consequences for racialized students and students from low-income families.

International organizations and comparative data

Since the 1990s, international organizations such as the OECD have been important players in the development of educational indicators (Henry et al., 2001). The connection between comparative international performance data and global economic competition has resulted in the OECD taking on an increasingly significant role as an education policy actor on the global stage, performing an important task by globalizing educational accountabilities across nations (Rizvi and Lingard, 2010). In fact, Leuze et al. (2007) attribute educational changes around the globe to two main trends: (1) the increasing involvement of international organizations and, (2) the growing marketization of education. According to the authors, these two changes not only resulted in international organizations such as the OECD becoming more involved in policymaking, but education has turned into a tradable commodity, subsequently creating competition among countries and between students. Current research regarding the role of the OECD in education positions it as a significant “institutional network that evolved into a ‘global political superstructure’” (Sørensen et al., 2021, p. 101).

Grek (2013) suggests that the rise of international comparative assessment began in the early 1990s with the comparative assessment of international adult literacy in several countries. This, Grek argues, has offered the OECD visibility and exposure which resulted in placing international tests in a comparative dimension. Discussing the historical trajectory of the OECD in education, Grek (2013, p. 706) argues that the “OECD’s capacity has not only been its ability to ‘move’ experts around the world and bring them around the same table, but also to then effectively steer and direct toward its own prespecified agenda.” In his analysis of the role of international organizations in education such as the OECD, Ball (2003, p. 216) discusses “new” policy technologies and how the metamorphosing of these international organizations is creating greater emphasis in “monitoring systems and the production of information.” Ball (2003, p. 216) suggests that “Performativity is a technology, a culture and mode of regulation that employs judgments, comparisons and displays as means of incentive, control, attrition and change based on rewards and sanctions (both material and symbolic).” As Jakobi and Martens (2010, p. 176) argue, “The OECD today not only define the problem but offers the solution With the new generation of indicators, the Organization has therefore gained an important status in several stages

of national policy-making from agenda setting to policy formulation and implementation.” In other words, the OECD, as a major international organization, has garnered the capacity to become a key policymaker and policy player, shifting educational policy discourses and driving global educational competition.

OECD's PISA, high performing and high equity

In promoting the important role of the OECD in the collection of comparative data, the OECD refers to the significant role of political leaders and politicians and the values they place on education, which results in achieving equitable outcomes regardless of cultural and economic diversity:

Starting from very different levels, a number of countries and regions have succeeded over the last few years in raising their students' performance substantially. They display some important common features. Their politicians and social leaders share with parents, teachers and students a strong belief in the value of education ... The best systems deliver strong and equitable learning outcomes across widely varying cultural and economic contexts.

OECD (2010) cited in Lingard et al. (2016, p. 95).

Following this connection between equity and achievement, the OECD (2010), through the Program for the International Student Assessment (PISA), an international assessment that measures the performance of reading, mathematics and science among 15-year-old students, identified Canada as a country whose students are high achieving. Using the high-performance rates of select immigrant populations on PISA, this was taken as indication for Canada's apparently highly equitable education system. However, the implications of this data is that it fails to account for the reality of Canadian-born racialized students—students who have low educational success rates and are much more likely to drop-out of school. According to a 2006 report by the Toronto District School Board (TDSB), the largest board of education in Canada with a high percentage of racialized students, of the 25% of students who do not graduate secondary schools, most of them are from Indigenous, Black, Hispanic and Middle Eastern backgrounds. The TDSB (2006) also mentions that these students have among the lowest rates of attendance and highest rates of suspension. They also have the lowest test score rates on standardized tests, such as the Education Quality and Accountability Office (EQAO), which tests the reading, writing, and math skills of all students across the province of Ontario in Grades 3, 6, 9, and 10.

Interestingly, this distinction between immigrants and non-immigrant racialized Canadians is ignored and overlooked in the OECD's report of Canada's performance on PISA, which has implications for racialized students; an important issue that we will delve into later in this paper. But for now, it is important to note that Canada's immigrants are admitted through the Point System and are thus likely to be highly educated. Using the OECD's data, Beach et al. (2006, p. 3) suggest that under the Point System, immigration has shifted from family reunification toward a class of economically privileged, skilled workers and a greater emphasis on accepting immigrants who are educated, young, and have capital. Indeed, the influx of more financially privileged, young, educated immigrants directly correlates with the success of immigrant students in Canadian schools which the OECD celebrates. It is ironic, then, that the OECD's (2006) earlier statement on immigrant success contradicts their own data that “on average, first generation Canadian students had parents with as many or more years of education as native-born parents” (OECD, 2006 cited in Mehta and Schwartz, 2011, p. 150).

Martino and Rezai-Rashti (2013, p. 607) research on equity, the OECD's PISA and the gender achievement gap provides a cautionary note for education policymakers to “not rely too heavily on PISA measures as basis for decision-making regarding questions pertaining to equity.” The authors also critique the OECD's PISA in their use of comparative data that often endorses school-based interventions while giving less attention to significant structural dimensions of inequality regarding race and social class—two significant factors that shape educational outcomes. Despite this, however, there is an undeniable role that international organizations such as the OECD play in not only producing new knowledge, but steering education policy and disseminating performance data globally, which has implications for education and educational equity that we should not take lightly. As stated by Grek (2013, p. 697), “international comparative testing appears then as much more than simply a statistical project; it has become part of a consistent effort to restore legitimacy and trust between populations and their governments.” This political use of PISA is also discussed by Moreno-Salto and Robertson (2021) in their research on the role of OECD's PISA in Mexico. They show how politicians have used PISA's comparative performance data to justify their own political objectives and how policymakers “draw upon much earlier renditions of PISA so that it now enters into Mexican education policymaking and shapes practice through a metaphoric back door” (Moreno-Salto and Robertson, 2021, p. 213).

It is also important to recognize that the significant role of international organizations does not reduce the position of nation-states in steering policies relevant to their own contextual factors (politics, culture, and history) while also considering the influence of global educational accountability policies. Novoa and Yariv-Marshall (2003), for example, have written about the “global eye” and the “national eye” and how they govern together through complementary international and national testing. However, it needs to be acknowledged that the OECD plays a significant role in driving education policies in order to facilitate an exercise of global governance which has broader implications for education policy and practice (Sharman, 2012).

Neoliberalism, racialized students, testing and accountability

Recent focus on the use of quantitative data and performance-based assessment have been critiqued by critical policy scholars as a technology of neoliberal governance in the education field (Ball, 2003; Grek, 2013; Hursh, 2013; Lipman, 2013; Lingard et al., 2013; Ozga, 2009). It is argued that the focus on comparative performance data of various countries with distinct political, economic, racial and cultural structures makes it quite problematic and “results in a ‘governance by comparison’ approach that generates truth claims and a particular way of seeing the world in which the material effects of race and poverty remain unmarked and are expunged from political and policy consciousness” (Lingard et al., 2016, p. 92).

Nichols et al. (2006), in their study of the relationship between pressures for high-stakes testing and student achievement, suggest that although the US has had a long history of standardized testing, its current emphasis on high-stakes testing could be traced to the 1983 publication, “A Nation at Risk”. According to the authors, “it was believed that if the public education system did not receive an overhaul, our economic security would be severely compromised” (Nichols et al., 2006, p. 3). The authors believe that this view of education and economic competitiveness was internalized in American culture. Through this logic, the neoliberal point of view considers students as human capital and future workers who “must be given the requisite skills and dispositions to compete efficiently and effectively” (Apple, 2005, p. 214). But as will be discussed in this section, we need to think about which students are benefiting from high-stakes and standardized testing and which students are not, and what purposes testing, under the guise of objectivity, meritocracy and self-responsibility, serves in sustaining a racist, capitalist system in the age of neoliberalism.

One of the most significant criticisms of testing has been its connection to datafication and a neoliberal mode of governance in which metrics, data and accountability play an important role in the production and enactment of policies that justifies and individualizes the performance of students regardless of structural and institutional challenges. Hursh (2013) situates high-stakes testing to the rise of neoliberalism in the US and its particular ideology of reducing the size of government while establishing the market as the model for all economic and social activities, including creating self-responsibilizing individuals who need to rely on themselves. This market model of efficiency has focused on standardized and high-stakes testing as an objective assessment tool to make teachers and students accountable. As Hursh (2013) contends, current reform measures have been justified and rationalized by creating more efficiency, accountability, equity and objective assessment of student performance and competition in the global job market. In this context, individual ability and performance is highlighted while underlying systemic and structural inequalities remain invisible. For example, in relation to race and racial inequality, it has been argued that the move toward comparative performance data and neoliberal governance in education in countries such as Canada and the United States has legitimized racial inequality by using the discourse of meritocracy. Goldberg (2009, p. 339), focusing on race and neoliberal modes of governance, demonstrates how the shift from a welfare/pastoral state to a neoliberal one has resulted in the acceptance of the ideology of self-responsibilizing individuals and “individualized merit and ability.” According to Goldberg (2009, p. 339), such ideologies have contributed to the discourse of racelessness under neoliberalism:

In diluting, if not erasing, race in all public affairs of the state, neoliberal proponents nevertheless seek to privatize racisms alongside most everything else Categories of race disappear as much from keeping account of discrimination itself, thus leaving the condition it is supposed to articulate, to mark and express as well as identify and assess, as untouchable as it tends now to be untouched.

In the US, there has been increasing critical investigation into the role of accountability and standardization in sustaining racial and class inequities, an argument rooted in the historical trajectories of standardized testing. A legacy mired in racism and the notion of White intellectual superiority, justified and institutionalized through the eugenics and IQ testing movements (Au, 2009, 2013), Au (2016) contends that testing began as a “racial project”. Eventually working its way into education, testing was instituted as an objective, fair, value-laden instrument to measure student performance and competence. The implications of this, however, was that such “scientific” testing ultimately declared the poor, racialized, women and immigrants, as intellectually subordinate while serving White supremacy (Au, 2013). As Knoester and Au (2017, p. 7) write:

Standardized tests, in conjunction with the ideology of meritocracy, thus have operated as a tool of White supremacy because they make racist outcomes of the tests appear as a by-product of the way the world works objectively and naturally- they “scientifically” justify the existing racial order, and they do so within a false promise of measuring everyone equally, accurately, and fairly.

The presumed objectivity of standardized tests has left no room for structural considerations of racism and class privilege; negating and denying how race, socioeconomics and other social locations may differentially impact students and their performance on tests. But existing scholarship on this proves otherwise. For example, in their study of standardized testing in the state of Virginia, Brunn-Bevel and Byrd (2015) draw on the historical and structural dimensions of education, detailing how historically, Black and White students were segregated by race, which relegated Black students to schools which were poorly resourced while White students received an education which matched their economic, social and material privileges. This history continues to inform the educational and social outcomes of students in the US, including the persistence of segregated schools, which provides important context to understanding the outcomes of Black and White students on tests. According to the authors, structural

disparities help to explain why, in almost every subject, Black students in their study were more likely to fail standardized tests in comparison to their White counterparts. Utilizing data to ascertain school district size, the ratio of students to teachers, school funding, school segregation and income levels to investigate testing results, Brunn-Bevel and Byrd (2015, p. 444) note that discrepancies in education are “exasperated by accountability systems based on standardized testing that discount the reality of segregated and resource-depleted school environments” that Black students are more likely to encounter than White students. Indeed, structural circumstances cannot be disregarded in conversations about testing, given that, as Marmol (2016, p. 8) writes:

[s]tudents cannot be expected to achieve comparable results if presented with vastly unequal material resources and social conditions, which are then compounded when their histories, cultures and ways of learning are devalued and deemed superfluous. Poverty, unequal funding of schools and distribution of resources need to be remedied and a newfound respect for cultural diversity and equality, or indeed equity, need to be emphasized.

The presumption that standardized tests are neutral, objective and unbiased is ultimately a fallacy when varying lived experiences and access to opportunity, funding and resources are absent from the discussion. Such an absence fails to recognize how testing has ultimately contributed to worsening racial, class and educational inequities (Marmol, 2016). As Thompson and Allen (2012) study of the disastrous impact of the Bush administration’s education policy “No Child Left Behind” demonstrates, the over-emphasis on high-stakes testing in the US has worked at the expense of Black American students who have become largely apathetic and disengaged as teachers have lost autonomy over what and how they teach due to increasing pressures on teachers to ensure that students perform well on tests. Creative, culturally relevant lessons are increasingly being replaced with more rigid and structured curricula as a “narcissistic education system” (Thompson and Allen, 2012, p. 218), where administrators and school boards are overly preoccupied with achieving an image of success based purely on test scores alone, becomes the norm.

The fears and concerns of racialized and low-income students who are subject to standardized testing has also been the focus of scholarly attention. In Kearns (2016) study of students who failed the high-stakes Ontario Secondary School Literacy Test (OSSLT) (a test that all students must pass to obtain their high school diplomas), the author shows that standardized testing works in favor of sorting and ranking students while constructing those who do not pass as “deficient” and illiterate. In the urban setting in which this study was conducted, many of those who did not pass the test were racialized, low-income and did not have English as their first language. Already marginalized based on their varying social identities, failing the OSSLT worked to further highlight their presumed difference; Kearns (2016, p. 135) writing that “the marginalized are confronted with their ‘otherness’ through the literacy test.” The findings of Spencer’s (2012, p. 132) research also suggests that in schools with high numbers of students who are visible minorities or English language learners, “the effects of standardized testing include a range of practices that reinforce inequity and increase social disparity.” These practices include narrowed expectations and intensive curricula that privilege dominant linguistic and cultural norms.

In a separate study, Kearns (2011) found that students who attended school in a community where the poverty rate was nearly 50% and the population consisted largely of first-generation Canadians, experienced shame, humiliation and stress for having failed the test. The youth in this study perceived the OSSLT as inequitable and counterproductive to their learning and well-being, finding the test to be less useful than their high school English classrooms. Indeed, an implication of standardized testing as found in Kearns (2011, 2016) studies is that such tests “alter youths’ perceptions of themselves: they question themselves, their abilities, experience themselves as inferior to others, or consciously oppose an inferior label given to them by a large testing agency” (Kearns, 2011, p. 123).

Such feelings attributed to fears of failing tests, such as stress and angst experienced by Kearns’ high school participants, begins at a much younger age. Eizadirad (2020) found that among racialized children in Grade 3 who had to take the EQAO standardized test preparation in Ontario, the test produced extreme anxiety among young children who feared failure and being considered “dumb” as a result. Examining the harmful impact of testing on racialized and low-income students, Eizadirad (2020, p. 288) argues that “externally administered standardized tests such as the EQAO function as a tool for stereotyping racialized identities” and outlined how stereotyping in this context functions on three levels: (a) constructing racialized students as low-achievers early in childhood contributes to deficit thinking among children and teachers; (b) perpetuating the stereotype that racialized students have poor intellectual abilities and placing them in separate behavioral and special education classes at an early age; and (c) challenging the stereotype that racialized students are low-achievers “by producing positive achievement results” (Eizadirad, 2020, p. 290). Regarding the latter, Eizadirad (2020, p. 290) explains that:

Although this might seem positive at the surface, the constant effort of having to defend one’s intellectual abilities while navigating predominately White elite spaces embedded with hierarchal power relations saturated with stereotypical assumptions about one’s race, culture, ethnicity, and/or socio-economic status is exhausting and socio-emotionally draining leading to subsequent poor performance, feelings of exclusion and not belonging, and/or triggering identity issues and crisis that can contribute to dropping out of school.

Such fears rooted in the stereotype threat that often accompanies academic failure thus works to harm racialized and low-income students early in their educational lives, “marginalizing and oppressing racialized identities via the interpretations and socially constructed labels created from standardized test results” (Eizadirad, 2020, p. 292). Likewise, in Wasserberg (2017) study of the

stereotype threat among high-achieving African American students, students expressed an active need to not confirm fixed preconceptions that considered Black students as failures; a stereotype that was applied to students given their school's low test scores.

In her ethnographic study of accountability driven reform in Chicago, [Lipman \(2011\)](#) provides significant evidence of the devastating impact of such reforms for African American and Latinx students in urban schools, which has resulted in the closing of schools, displacement and disenfranchisement. [McNeil et al. \(2008\)](#), in their research on a test-based accountability policy in Texas, expose drastic consequences of high dropout rates among students who are poor, English language learners, and come from African American and Latinx backgrounds. Similarly, [Fontaine \(2016, p. 8\)](#) discusses fundamental problems with the narrow framework of accountability and datafication, arguing that the:

Education marketplace disproportionately advantages those with the time, social capital, and institutional knowledge to navigate the system. They benefit the relatively privileged within all racial and social class groups and function to keep middle and upper class families invested in public schools in gentrified areas (Ball et al., 1995). As a result, accountability programs may backfire and have the unintended consequences of reinforcing school segregation as parents eschew neighborhood schools in favor of higher performing schools elsewhere.

As addressed, the implications of standardized testing for racialized and low-income students has been subject to much scholarly critique in Canada while a growing body of literature is also exposing the negative impact of testing and accountability regimes on students' experiences of schooling and teachers' pedagogical practices ([Kearns, 2011, 2016](#); [Lubiensky and Yoon, 2017](#); [Rezai-Rashti and Lingard, 2020](#); [Spencer, 2012](#)). [Lubiensky and Yoon \(2017, p. 6\)](#), researching test-based accountability policies in two Canadian provinces (Ontario and British Columbia), conclude that "school choice has become a middle-class privilege, or is practiced largely by parents who place high value on education as means to further advantage their children" (p. 6). [Rezai-Rashti and Lingard \(2020\)](#), drawing on the perspectives of racialized students in their comparative study of test-based accountability in Canada and Australia, challenged the notion that test-based accountability benefits all students equally. The authors further conclude that test-driven accountability has resulted in further segregation of racialized and poor students in both countries while benefitting those families with social and cultural capital who are able to access the choices offered in the education marketplace.

Analyzing the impact of neoliberal reforms on teachers in Ontario's secondary schools, [Rezai-Rashti \(2009\)](#) found that standardization resulted in a prescriptive curriculum and reduction in teacher autonomy as a result of mandated appraisals of teacher performance. Increasing standardization in Ontario's education system manifested itself through a "results-based curriculum focusing on what students are able to do at the end of the program; and standard discipline oriented (subject) curriculum based on measurable items" ([Majhanovich, 2002, p. 165](#)). Furthermore, [Majhanovich \(2002\)](#) argues that although educational reform, hallmarked by standardized curriculum and high-stakes testing, has been promoted under the banner of excellence and quality enhancement, it has had dire consequences on the de-skilling of teachers, leaving little room for creativity, innovation or autonomy. Similarly, speaking of the use of large-scale assessments, [Duncan \(2011\)](#) detailed the unintended consequences of this for teachers, including constraints on instructional time, higher order thinking skills, ability to cover the curriculum and teacher professionalism. It is not uncommon to hear teachers lament that "more time is spent preparing for tests or testing than is actually spent teaching and that seems counter intuitive" ([Duncan, 2011, p. 83](#)).

In the context of school leadership, [Spencer \(2012, p. 132\)](#) investigated how the provincially mandated system of accountability has "constructed social practices and relations, and how it constituted agents in schools as the subjects of reform." Using governmentality as her approach to empirical data, [Spencer \(2012\)](#) found that high-stakes tests and accountability policies have resulted in significant changes in the practices of school administrators, writing that "administrators have moved into new management roles as, increasingly, there time is devoted to tasks for monitoring, accounting for, and reporting on the administration of policies concerned with performance and outcomes, such as standardized testing" ([Spencer, 2012, p. 132](#)). [Rezai-Rashti and Segeren \(2020\)](#) also argued that the pressure for test-based accountability has resulted in urban school leaders working to game the system and engage in strategies of manipulating data to show school improvement. Their research on the experiences of urban secondary school leaders with the Ontario Secondary School Literacy Test (OSSLT) (a test that all students must pass to obtain their high school diplomas) revealed how they articulated the use of various methods or tactics for manipulating or fabricating test result data to artificially raise a school's reported performance in an effort to be seen as complying with accountability expectations. Participants revealed that it was not an uncommon practice to ask certain students to stay home on the day of the test so that only those students who were likely to pass the test would write it. A literacy coordinator in their research study, who worked directly with schools to improve test results, explained that there are two methods for reporting the results of standardized tests. Method one reports on the results of all eligible students and how many passed. So, if a student was absent or was deferred, this would be reported as a failure, impacting the school's overall score. Method two only reports on students who wrote the test. The school leader further explains that:

there are schools in the city that defer all of the applied level students and so 90 something percent are passing, but that gap between the two scores is large. So, method 2 looks good on paper. So, newspapers report on method 2. Schools report on method 2 because the scores are higher in comparison to method 1 that included all eligible students.

This is similar to the findings of [Ball et al. \(2012\)](#) research which showed a clear distinction between policy implementation and enactment. The authors suggest that it is important to focus attention on how schools deal with “contradictory policy demands, and the diverse ways that they creatively work to fabricate and forge practices out of policy texts and policy ideas in the light of their situational realities” ([Ball et al., 2012](#), p. 142).

As will be detailed further in the next section, the effects of public perception in an age of data-driven decision-making and engineered crises of failing schools and failing students is that the general public is being conditioned to believe that “the implementation of standards-based programs signals students, parents, and society at large that teachers are not to be trusted or respected and that technical/managerial control is what is needed to fix the problems that teachers helped create” ([Duncan, 2011](#), p. 84). But as the existing literature reveals, the overemphasis on accountability through testing has concerning outcomes for racialized and poor students and teacher efforts to effectively reach the educational needs of such students. The implications of this for educational equity must be seriously acknowledged.

Mediatization and standardized testing

One of the most significant but perhaps unintended consequence of standardized testing has been the mediatization of test results and the ranking of schools. Addressing the mediatization of educational performance and the way in which various forms of media play an important role in shaping public perceptions, [Rawolle and Lingard \(2011\)](#) detail the impact that journalism and journalists have in placing issues on the education agenda. Indeed, journalists identify problems and pose solutions, which serve to deeply shape and inform public perceptions of the education system. This was well documented in [Parker \(2017\)](#) historical critical policy analysis, where she investigates how neoliberal education policies were “sold” to the public. Through educational reforms, intended to resolve the educational crisis that Ontario students were falling behind their international counterparts, Parker demonstrates how the news media highlighted the need for educational policy changes that favored neoliberal reforms. Documenting the publicization of EQAO test results, [Parker \(2017, p. 53\)](#) found that the “news media saturate discussions of whether education policy needs an overhaul based on the latest test scores.”

Research conducted by [Rezai-Rashti and Segeren \(2020\)](#) shows how urban school leaders in Ontario and British Columbia understand and critique the role of the media in reporting and ranking schools, which often results in stigmatization of racialized and low-income students, their schools, as well as their communities. For example, one of the school principals in their research implicated the Fraser Institute, a conservative think tank that reports on the performance of all schools across four provinces in Canada. The principle noted the impact of the institute’s annual report on test scores, stating: “when these Fraser reports and media reports come out and bash certain schools, it does stigmatize places. And the reputation of buildings become affected. Those stigmatizing reports don’t take the pulse of the whole school.”

Indeed, this public shaming has contributed to stigmatizing schools in low-income, racially diverse neighborhoods where test results are often lower. [Rezai-Rashti and Segeren \(2020\)](#) suggest that the publication of comparative performance data has enabled middle-class families with above-average levels of capital to opt out of their local, under-subscribed schools and choose higher performing ones instead, a trend identified in two provincial contexts. Another school principal in British Columbia explained that media reports have impacted the reputation of his school, noting that it is a contributing factor to low enrollment rates and the flight of middle-class families to other schools in the area. [Martino and Rezai-Rashti \(2013\)](#), in their analysis of the media and the discourse of the gender achievement gap and failing boys, which were based on PISA test scores, provide important insight into the significant role of the media within the network of policymaking and practice. The authors write that the media “constitute a particular policy habitus, particularly in relation to the endorsement of a gender achievement gap and the mobilization of discourses about failing boys in the Canadian context” ([Martino and Rezai-Rashti, 2013](#), p. 604).

The publication of student performance data and public shaming of low performing schools has unintended consequences for schools that are spending increasing amounts of time and effort engaged in entrepreneur-like activities. Reflecting trends noted in the literature associated with the new public management of schools, principals and guidance counselors reported trying to “sell” or “market” their schools to attract students and families. This trend is especially evident in urban schools or low performing schools at risk of closure, and school leaders are the ones tasked with recruiting new students, as [Rezai-Rashti and Segeren \(2020\)](#) found. Interestingly, school leaders are now submerged in business related activities, such as marketing their school by “selling” special “features” of their schools through extra-curricular activities or specialized academic programming. As the head of the guidance department in an urban school explained: “I feel a lot of pressure to go out to the feeder schools and to market our school and to promote our school, because we’re all competing for the same students downtown”. Part of her marketing campaign involved crafting a more robust portrait of her school to bolster its public reputation:

I’m always on Twitter and Facebook reposting positive news stories and posting pictures of all the great things happening here. There is pressure to be in control of your own story as a school, because parents and the community are using technology. We’re trying to update our website all the time, make it more student friendly with lots of photos and things like that, just to be relevant and recent.

Rezai-Rashti and Segeren (2020).

While school choice appears to be desirable and increasingly available, research shows that those exercising this choice are predominantly middle-class parents. School choice, however, works to the disadvantage of students and families from racialized and low-income backgrounds who lack the social and cultural capital of their middle-class counterparts to take advantage of a wide array of schooling options (Rezai-Rashti and Lingard, 2020; Yoon et al., 2017).

It is important to mention that the negative role of the media has been acknowledged by academics and more recently by national and provincial governments. For example, in 2017, the Ontario Ministry of Education appointed two advisors to guide and transform assessment and reporting practices by acknowledging the significance of equity and Indigenous education. The report predominantly focused on misuse of performance data and ranking of schools. Their report listed 18 recommendations to transform the culture of assessment in Ontario in order to achieve the goal of equity, well-being and enhancement of public confidence in Ontario's publicly funded education. Together, these recommendations sought to connect assessment to curriculum, identify and respond to inappropriate misuse of provincial large-scale assessment data (EQAO) and oppose the public ranking of schools. The advisory committee raised concerns over the current nature of provincial assessments in the context of Ontario's commitment to equity and cultural diversity, especially the Grade 10 Literacy Test (OSSLT), which the committee agreed should not be linked to the high school graduation requirement. The recommendations of the advisory group included reducing the number of tests by eliminating standardized tests in several grades as well as creating a mechanism to prevent "inappropriate use and misuse of provincial large-scale assessment data by other organizations/individuals, including opposing public ranking of schools" (Campbell et al., 2018, p. 70).

The literature on high-stakes testing and accountability in several other countries such as the UK and Australia also shows the impact of national testing and its consequences for the promotion of comparison data and an audit culture. Lingard and Sellar (2013, p. 652) discuss how collecting performance data and reporting through the "My School" Website is causing reputational damage to schools, arguing that the reporting of Australia's National Assessment Program-Literacy and Numeracy (NAPLAN):

has become high stakes for systems through reputational damage caused by perception of poor performance ... the pressure and nervousness felt by policy makers and politicians in response to NAPLAN outcomes are more immediately motivated by concerns to improve or maintain the reputation of schools and systems and to secure funding.

Gillborn (2008, p. 65) work on the "gap talk" in the UK also addresses how the government is using performance data as justification for educational improvements, suggesting that "closing and/or 'narrowing' gaps operates as a discursive strategy whereby statistical data deployed to construct the view that things are improving, and the system is moving in the right direction."

In contrast to many of the countries discussed in this review, Finland has an exceptional trajectory of not engaging with neoliberal accountability while being one of the top performers in the international PISA test. Writing about Finnish distinctiveness, Simola et al. (2013, p. 623) discuss the rise of Finland as an exemplary model through incremental policy rather than through neoliberal declaration, writing that "Finland did not follow the Anglo-Saxon accountability movement in education" as teachers and schools are the ones who are tasked with evaluating students. In Finland, with a long history of no national testing (with the exception of a high school matriculation examination), politicians and educational officials have been consistently rejecting the notion of school ranking based on performance indicators. In 2005, the Finish Education Evaluation Council formally stated their opposition to ranking and mediatization of individual school results:

In publicising evaluation results schools will not be ranked, nor will schools or teachers will be labeled as of high or low standard on the basis of one-sided evidence. When reporting upon an analysis based on a nationwide sample, no data identifying individual schools will be given
cited in Simola et al. (2013, p. 623).

In nations where neoliberalism is increasingly shaping the push toward the marketization of education, it remains to be seen to what extent the mediatization of test scores and rankings will shift, and perhaps even undermine, the democratic foundations of public education. As trends mentioned in this section reveal, the implications for educational equity are vast.

Conclusion

The role of performance-based accountability cannot be understood without carefully investigating national testing regimes, key actors, power dynamics, as well as the inflecting role of international organizations such as the OECD in global governance. In this paper, we emphasized the influence of international organizations in the collection of comparative data and their significant role in steering education policy around the globe. We believe such comparative performance data is decontextualized with limited focus on local and national contexts of schooling.

We also focused on a select number of studies which have explored the impact of test-based accountability on racialized students and students from low-income families. Our main objectives have been to show how change to test-based accountability nationally and globally have had serious consequences for racialized and poor students. Situated within the context of neoliberal rationality

and relying on discourses of meritocracy and self-responsibilizing individuals, we believe that performance-based accountability has resulted in focusing too much on individual students and teachers while leaving broader and more significant structural and institutional inequities invisible. Our research raises important questions regarding the winners and losers of neoliberal educational reforms and whether these forms of top-down accountability measures and assessments are the right approach in the first place. We believe, as argued by Shore and Wright (2015a, p. 27), that “the construction of easy-to-read, decontextualized numbers, however faulty, also makes them popular and a useful tool of management and governance.” However, these rankings and numbers do not impact all individuals equally and “audit culture is based on a zero-sum game: to succeed in this game, someone has to lose. This is the basis of the most corrosive effects of this form of governance” (Shore and Wright, 2015b, p. 432).

Introduction

It is undoubtedly the case that education in its many forms has undergone notable change since the first edition of this encyclopedia was published in the 1980s. There can have been few changes more marked, however, than those experienced within the group of schools known as 'international schools'. In this chapter, we begin by setting the scene with a short overview of the development of this area from its earliest days, before showing how an initially steady increase in numbers was superseded by a massive unprecedented growth in the closing years of the 20th century. The remainder of the chapter will focus on a number of issues and challenges arising in what will be described as the international school sector, as it has not only grown substantially in size but has also markedly changed in nature as the environment in which it is located, and the expectations made of it, have themselves undergone major changes.

Early days

One feature bedevilling international schools (a term used here to encompass all schools worldwide that might self-identify or be considered as such) and challenging those who write about, study, work in, or research them is the lack of a clear and agreed lexicon. Frustratingly, as the sector has grown and broadened in scope, the terminology has if anything become more rather than less complicated, as new developments have introduced new terminology – in some cases to describe concepts very similar to those that already exist, though with different labels for what are essentially variants on an underlying theme. Discussion about such variations has been described by Marshall as 'the big terminology debate' (2007: 38), and since Marshall's observation there has been no reduction in the complexity or lack of clarity which, if anything, has continued to increase.

In the absence of a universally accepted definition of the term 'international school', it could be argued that the origins of the concept of schooling outwith national borders can be traced back to the nineteenth century. Maseru English Medium Primary School in the then British Crown colony of Basutoland (since 1966 the Kingdom of Lesotho), for instance, was established in 1890 to cater for the children of English-speaking missionaries, traders and officials of the British administration (MEMPS, 1990), while the International College at Spring Grove, West London, UK, was founded in 1866 by such luminaries as Thomas Huxley, Richard Cobden, John Tyndall and the novelist Charles Dickens – all advocates of free trade, whose vision of a number of international schools in Europe was based on students from different countries being educated 'among school fellows of all nations ... the method of study being precisely the same in each international school' (Dickens, 1864 in Sylvester, 2002: 8), with the students thus becoming 'international ambassadors' (Stewart, 1972: 5). Sylvester (2002) provides a more detailed analysis of developments leading to the establishment of this, arguably, 'first' international school. Twin rationales for what might be thought of as international schools were therefore evident from the earliest days: the *pragmatic* (offering education to children displaced from their home education system due to a parent's global mobility) and the more *ideological* (intentionally bringing together students from different national/cultural contexts with a view to them learning within a broader context than the national borders within which education would more usually be prescribed).

More commonly described as the earliest international schools are the International School of Geneva, Switzerland and Yokohama International School, Japan, both established in 1924 and with the former indeed claiming to be the 'first international school' (Walker, 1996). Though with different provenances from MEMPS or the International College at Spring Grove, clear in both schools is a pragmatic rationale for their establishment: to cater for the children of globally mobile or otherwise temporarily displaced professional parents who wished their children to accompany them rather than to 'board' in the home country, and for whom other schooling available locally was deemed inappropriate – while overlapping with a post-Great War ideological vision of

encouraging the broadening of horizons, development of intercultural understanding and preparation of adults equipped for effective and peaceful interaction with those from other backgrounds than themselves (see Knight, 1999; Stanworth, 1998). With increasing global mobility emerged growing numbers of international schools worldwide, often established by parents themselves: as, for instance, in the case of The Alice Smith School in Kuala Lumpur, Malaysia which began in 1946 as the eponymous Alice Smith taught her own young daughter, and subsequently growing numbers of children of friends and colleagues (Alice Smith School, 1996). Based on a different rationale, post-World War 2 concerns that such horrors should never be experienced again were central to the establishment, inspired by the visionary Kurt Hahn, of Atlantic College in south Wales (Peterson, 1987), founded in 1962 with the express purpose of bringing together students of 16–18 years of age from around the world, on a scholarship basis, to study and live together. Having something in common then with Spring Grove in being founded expressly with an ideological purpose, Atlantic College was the progenitor of the worldwide United World College (UWC) movement which, at the time of writing, has 18 member schools and colleges worldwide, all espousing the philosophy that ‘UWC makes education a force to unite people, nations and cultures for peace and a sustainable future’ (UWC, 2021) and embodying a response to the question asked in his 1957 Nobel Prize acceptance speech by Lester B Pearson, then Prime Minister of Canada, and after whom the UWC in Vancouver is named: ‘How can there be peace without people understanding each other, and how can this be if they don’t know each other?’ (Lester B Pearson College of the Pacific, 1982: 9).

Together with a growth in numbers of United World Colleges in the following half century, until relatively late in the twentieth century a steady increase was seen in numbers of individually established international schools established principally to cater for growing numbers of globally mobile professionals in a particular location. Though in the absence of a universal definition of the term, exact numbers of international schools cannot be cited, growth has nevertheless been evident over a number of years. (See, for instance, Hayden, 2011). While having an essentially pragmatic *raison d’être*, such schools would also very often promote a more ideological form of education in preparing the adults of tomorrow for an increasingly globalised world. In arguably the first piece of research-based academic writing with a focus on international schools, in 1995 Hayden and Thompson observed that, at that point, the international school sector could be characterised as a ‘conglomeration of individual institutions which may or may not share an underlying educational philosophy’ (1995). Reflecting later on what they described as the ‘globalist’ and ‘internationalist’ approaches to education, where the former relates to serving a market that requires the global certification of educational qualifications with portability between schools and transferability between systems, while the latter is underpinned by an existential, experiential philosophy of education that values the moral development of the individual and the development of a sense of responsible citizenship, Cambridge and Thompson (2004) point out that the form of education practised in international schools is (or was at that time) the ‘reconciliation of these contrasting approaches’, with each reconciliation being unique to the individual institution. We shall return to more recent developments in the sector after exploring first a number of related concepts.

International education

If the terminology surrounding international schools is unclear, that relating to the concept of international education is no clearer. In the first edition of this encyclopedia, Husén suggested that international education can be considered as including ‘all educative efforts that aim at fostering an international orientation in knowledge and attitudes’ (1985: 2660). In the same year, the Harvard Educational Review’s Special Issue on international education argued in its editorial preface that ‘International, global, cross-cultural and comparative education are different terms used to describe education which attempts ... to come to terms with the increasing interdependence that we face and to consider its relationship to learning’ (Fasheh, 1985). More recently, as interest has grown in education across national borders, the term ‘international education’ has come to be used in a range of contexts. It may be encountered, for instance, in debate relating to the higher education (university level) sector, where the internationalisation of higher education is the focus of increasing research interest as, in some if not all parts of the world, universities accept increasing proportions of ‘international’ or ‘overseas’ students, appoint growing numbers of academic staff from around the world, engage in research across national boundaries and establish ‘outposts’ in other parts of the world than their home country. The research base for this form of international education, or ‘transnational education’, is steadily broadening (see, for instance, Clifford and Montgomery, 2017).

At school level, in addition to the international schools on which this chapter largely focuses, a recent phenomenon in some countries has been increasing interest in internationalisation of the school experience. In some contexts this may take the form of children from one country attending a school in the national system of another country (in residential/boarding schools in England, for instance). In other contexts, it may arise from growing recognition that education for any child, whatever their background, needs to prepare them for a future that will not be entirely nationally-focused. Whether or not a child growing up in, say, the UK aspires to adulthood as a diplomat, or a career with a multinational company, it is likely that their future life – even if they never travel beyond their home borders – will be heavily influenced by events beyond those borders. While much of the food they eat, goods they purchase and entertainment in which they engage is likely to emanate from other parts of the world, it is also the case that global events and geopolitics will undoubtedly impact in some way upon their future lives. Recognition of the importance of preparing them, as far as possible, for that future has led to initiatives including, in England for instance, schools supplementing the statutory national curriculum with Oxfam materials (2015) that provide a guide for teachers on global citizenship, and projects including the UK’s Global Learning Programme (2021).

The area of education where, perhaps, the most widely recognised work has been done on internationalising the educational experience at school level is that relating to the formal curriculum, where major strides have been made in the past half century that are of direct relevance to international schools.

International curriculum

As the international school sector has experienced rapid growth and become increasingly recognised in recent years, so too has the concept of a formal curriculum that goes beyond curricula offered in national contexts that essentially prepare young people (notwithstanding more recent developments such as those described above) for a future in that national context. The first curriculum developed specifically to cater for the needs of international schools is generally accepted to be the International Baccalaureate (IB) Diploma Programme, first examined in 1970 and developed by a small number of schools with input from the International Schools Association and from experts in national contexts including the USA, UK and France following developments spearheaded in the first instance by the International School of Geneva (Peterson, 1987). Prompted by the pragmatic need of schools preparing 16–19 year old students who aspired to university entrance in a range of different national systems for a curriculum that could be studied by all and would be recognised worldwide, the IB Diploma has since been joined by its sibling Primary Years Programme (PYP), Middle Years Programme (MYP) and Career-related Programme (CP) (IB, 2021a), thus offering a suite of programmes for which schools can apply for authorisation. Though IB programmes may also be offered within national systems of education, they are found in many international schools worldwide, facilitating as they do the transition of globally mobile students between international schools and countries, while at the same time offering a recognised form of education that not only satisfies pragmatic needs but also supports an ideological approach to education in encouraging students to develop international mindedness (Barratt Hacking et al., 2018) as well as a number of attributes including being open-minded, principled and caring, as summarised in the IB Learner Profile (IB, 2021b).

Not all international schools, however, offer all or any of the IB programmes. While the IB is undoubtedly a major actor in the international school sector, so too is the widely recognised Cambridge Assessment International Education. Cambridge's International General Certificate of Secondary Education (IGCSE), for instance, is offered in large numbers of international schools worldwide, with other programmes also offered across the age-range (Cambridge Assessment International Education, 2021). More recently joining the international school scene are programmes developed by Fieldwork Education, whose International Primary Curriculum (IPC) was launched in 2000 and has since been joined by the International Middle Years Curriculum (IMYC) and International Early Years Curriculum (IEYC) (Fieldwork Education, 2021). It should be noted, however, that not all international schools elect to offer what might be described as an international curriculum. Depending on the nature of the international school (about which more below), it may choose rather to offer the curriculum of a 'home country' or, indeed, its own school-based curriculum. It is not uncommon, for instance, for British-type international schools to offer the national curriculum of England, across part or all of the age range, in conjunction at pre-university level with either A levels from England or, in some cases, the IB Diploma. International schools with other national affiliations may similarly offer curricula from the home country, possibly in combination with an international curriculum for part of the age range.

Thompson's (1998) categorisation of international curricula offered in international schools proposed four categories which continue to be helpful today, as follows:

- Exportation: the marketing abroad of existing national curricula and examinations, with little if any adjustment to take account of the different context and a value system 'unapologetically that of the country from which it is exported'
- Adaptation: where existing national curricula and examinations are adapted for the national context, with the 'inherent value system' not likely to change at all and the risk of, as Thompson puts it, an 'unwitting process of educational imperialism'
- Integration: where 'best practices' from a range of 'successful' curricula are brought together into one curriculum for operation across a number of systems or countries (with attendant challenges potentially to be faced from the different values and ideological positions in question)
- Creation: the development of a programme 'from first principles'

Issues relating to curriculum in the international school context will be returned to later.

International schools: developments and contemporary issues

In the quarter century and more since Hayden and Thompson described international schools as a 'conglomeration of individual institutions which may or may not share an underlying educational philosophy' (1995), much has changed. Massive geopolitical changes in the global environment and increasing forces of globalisation manifested in a 'growing magnitude or intensity of global flows such that states and societies become increasingly enmeshed in worldwide systems and networks of interaction' (Held et al., 2000:3), have been majorly affected by, and have influenced, international schools. Coulby and Zambeta argue that 'Educational institutions themselves are part of the process of globalisation because of their central role in the development of the knowledge economy' (2005: 1), and there can be little doubt that this assertion applies to international schools to at least the same extent as it does to other educational institutions. From their earliest days as largely pragmatic responses to a practical need in specific locations

where globally mobile expatriate families were found, which indeed describes the context in 1995 as noted by Hayden and Thompson, international school numbers have massively increased and, with that growth, has grown the diversity that characterises the sector today. A quarter of a century ago, few children attending international schools were not globally mobile expatriates. Indeed it was not uncommon at that time for 'host country national' students to be prohibited by law from attending such schools, as was the case in, for instance, China, Malaysia, Singapore and Thailand. Since that time, the perceived pragmatic benefits of an international school education – offering a curriculum and end-of-school qualification recognised by universities worldwide, and taught through the medium of English, to fluency in which many non-first language English speakers aspire for their children – have persuaded affluent and aspiring middle class parents in some countries of the competitive edge that such an education will provide for their children. Some, though not all, countries where host country nationals were previously forbidden from attending such schools have since deregulated. Thailand is a case in point where, following relaxation of the law prohibiting Thai students from attending international schools, numbers of international schools saw a steady growth with many new schools catering for the 'home' rather than expatriate market (MacDonald, 2006).

Of particular interest in this respect, given the implications for growth, is the case of China, which has retained its earlier prohibition of Chinese nationals (other than those of dual or multiple nationality) attending previously existing international schools (or 'schools for the children of foreign workers'), and has more recently begun the development of a new type of international school intended for Chinese nationals rather than expatriates, which show every sign of experiencing large growth in the coming years: what Poole (2021) describes as 'Chinese internationalised schools'. In addition to growth across Asia (Machin, 2017), other areas of notable growth include the United Arab Emirates (see, for instance, Azzam, 2021) – again, where international schools are catering not only for the globally mobile but also for the local population. As just some examples of growth in the international school sector, it is clear that, while the numbers of what might be described as 'traditional' international schools, catering for globally mobile expatriates, may have seen some growth, the more marked growth has been in those schools established principally to cater for the 'host country' national families who aspire to their children attending university, and possibly developing a career, in another (often western, anglophone) country. Indeed such has been the shift in the balance of these two types of school in the international school sector over recent years that it has been estimated that, between 1983 and 2013, the ratio of 80% expatriate: 20% host country national students attending international schools worldwide completely reversed to 20%: 80%.

Issues of terminology continue to complicate the international school debate, with no one body having the authority to determine whether a school may or may not be described as an international school. It is thus, in the absence of a universally-accepted definition, impossible to chart definitive growth of international schools over the decades. In approximate terms, however, it has been estimated that there were around 50 international schools worldwide in 1964 (Bereday and Lauwerys, 1964) and 1000 by 1989 (Matthews, 1989). More recently, ISC Research – which curates a global database that monitors activity in the international school sector and uses a very specific definition of international schools, for their own market intelligence purposes, of schools delivering a curriculum at any age range wholly or partly in English outside an English-speaking country, or that offer an English-medium curriculum other than the country's national curriculum and are international in their orientation, if based in a country where English is one of the official languages (ISC Research, 2021a) – record 12,373 international schools as at July 2021, from a total of 7655 in July 2011 (ISC Research, 2021b).

Many attempts have been made over the years to bring order to the large number of international schools in terms of types and categories, by authors including, *inter alia*, Matthews (1989) and Sylvester (1998), all of them developed before the more recent shift toward international schools catering for host country nationals, and many of them challenged by the fact that their proposals began to date rapidly almost as soon as they were disseminated. (See Hayden, 2006 for details of other categorisations). Our own more recent categorisation (Hayden and Thompson, 2013) proposed that the rapidly-changing sector could be thought of as including three main 'types' of international school, described as follows:

- 'Type A' 'traditional' international schools: established principally to cater for globally mobile expatriate families for whom the local education system is not considered appropriate
- 'Type B' 'ideological' international schools: established principally on an ideological basis, bringing together young people from different parts of the world to be educated together with a view to promoting global peace and understanding
- 'Type C' 'non-traditional' international schools: established principally to cater for 'host country nationals': the socio-economically advantaged elite of the host country who seek for their children a form of education different from, and perceived to be of higher quality than, that available in the national education system

It has, however, been clear for some time that this typology – relatively recent though it is – is in need of updating. While Types A and B may still reasonably represent schools today, Type C has – since the term was coined – become more complex as the part of the international school sector catering principally for host country national students has grown and diversified. Recent marked growth in this area, for instance, includes what may be considered exports of elite private schools from England including, among others, Dulwich, Harrow and Shrewsbury (see Bunnell, 2008) together with the Chinese 'internationalised' schools referred to above. Unlike the not-for-profit nature of many Type A schools, where surplus income is ploughed back into developing the school rather than into profits for owners, shareholders and/or investors, notable among the characteristics of many, though not all, schools that could be included in 'Type C' is that they are for-profit and have been established on a more commercial basis than traditionally has been the case for international schools. Notable too as a major change in the international school sector in the last quarter century has been the shift from the 'conglomeration of individual institutions', observed by Hayden and Thompson (1995: 332) as noted above, to the creation of *groups* of international schools established on a for-profit basis. Previously unusual,

other than in the case of a small number of groupings such as the European Schools (Gray, 2003) or Shell Schools (see Hayden, 2006), groups of international schools may now be found, often catering essentially for the local market, within national contexts including China and Vietnam, but also cutting across national borders. Some well-established, though still relatively recent, groupings of international schools worldwide that may cater for both local students and the more globally mobile include, *inter alia*, the GEMS group, Nord Anglia and Cognita. And while there may be a lack of clarity with respect to the meaning of the term 'international school', means of judging the 'quality' of particular international schools have grown up in the form of accrediting agencies, including among others the Council of International Schools (CIS), which accredits schools where evidence is found of achievement of pre-specified standards, thus providing quality assurance in the sector.

In the context of the current growth in the international school sector, and the likelihood of that growth continuing, a number of issues and challenges arise, as discussed in the following sections.

Terminology and definitions

If terminology in this context was bedevilled by lack of clarity when Marshall highlighted the issue in 2007, how much more is that now the case as the sector grows and diversifies, with schools having different reasons for including 'international' in their name. Undoubtedly in some cases a marketing strategy, in other cases what might to a casual observer appear to be an international school may choose not to be described as such. Others make clear their affiliation with a particular national context through a title such as 'British International School of X' or 'American School of Y', while others eschew any national affiliation and offer an international curriculum throughout the school, to students of many different nationalities, and cultural and linguistic backgrounds. Whether a lack of consistency or clarity in terminology is a cause for concern may be debatable. Some would argue that it is (see Azzam, 2021); we share a concern that, at the very least, the lack of consistency should be recognised and acknowledged.

Nature of education

In the earliest days of educating away from their home country young people who were expected to return in adulthood to that context, the form of education offered might not have necessitated much in the way of debate. If the purpose of education was to prepare young people for adult life in their 'home' context, whether their childhood was spent there or elsewhere, then the traditional concept of curriculum – as exemplified for instance in Lawton's concept of curriculum as a selection from the culture of a society (1989) – would apply equally to those temporarily displaced from that society. American expatriate students for instance could follow a US-style curriculum in a school outside the US, in preparation for their return. Complexity emerged with the growth of international schools catering for students from multiple national and cultural backgrounds, whose teachers were faced with preparing students at the pre-university level for return to a 'home' university and for the qualifications which would demonstrate their preparedness to embark upon university education in that context. Challenges presented by teaching the subject of history, as one notable example, to a class of students needing to prepare for national qualifications with different curricula and examinations were, as noted earlier and discussed in more detail elsewhere (see, eg. Peterson, 1987) instrumental in leading to the creation and development of the International Baccalaureate (IB) Diploma as a curriculum that could be studied by all students regardless of destination, in the anticipation of acceptance as a university entrance qualification worldwide.

As the demand for international programmes is growing, however, so too are questions as to what it means for a form of education to claim to be 'international'. Is it sufficient that a curriculum is effectively a form of educational 'home away from home'? And how should the 'ideological' theme running through many such programmes (claiming to develop in young people attributes such as international mindedness, global competence, and respect for others different from themselves) relate to the more 'pragmatic' theme of preparing young people for life in an increasingly globalised world, where attributes and skills including multilingualism and intercultural literacy (Heyward, 2002) will be at a premium in the global knowledge economy (Lauder et al., 2012) of the 21st century?

As noted earlier, many different programmes are now offered in international schools worldwide. And as Thompson has highlighted, they may have been designed intentionally to be international, or be exported or adapted from a national context while, as Thompson puts it, risking an 'unwitting process of educational imperialism' (1998). Those that claim explicitly to be 'international' rather than arising from the context of any one national education system have in so doing laid themselves open to challenge. For some time there have been claims that the IB programmes, for instance, are 'Eurocentric' (not least because of the Diploma's three main working languages of English, French and Spanish). More recently, questions have been raised about the meaning of 'international' in this context, with suggestions that such programmes (others that claim to be 'international', as well as those of the IB) might in fact be more accurately described as western or western-liberal in values and focus, as discussed by, *inter alia*, Drake (2004), Van Oord (2007) and indeed by Walker (2010), a previous Director General of the IB. Such questions seem likely to persist, with proposals that international programmes should acknowledge other cultural perspectives than simply that of a western liberal value system arguably being in tension with the fact that the recent rapid growth in international schools is highlighting the latent demand from growing middle classes in non-western contexts for the form of international (western) education expected to provide their children with a competitive edge through the acquisition of English-medium internationally recognised qualifications that offer access to prestigious western universities, and thus to the western privileged lifestyle to which many such families aspire.

Debate will no doubt continue as to what it means, or should mean, to offer an international form of education. Having emerged as a concept through the IB Diploma Programme, principally as a pragmatic means of catering for globally mobile (largely

western) expatriates, and at a time (1960s) when the term 'globalisation' was only just beginning to emerge (Held and McGrew, 2000: 1), expectations have been raised in the intervening years about what might be expected of a form of education with such aspirations. Thompson's question about the risk of an 'unwitting process of educational imperialism' is echoed in more general questions of 'post-colonialism' raised by Andreotti, for instance (2011). Perceived exclusivity of programmes such as the IB Diploma Programme that are relatively expensive to offer compared with their nationally-based counterparts and thus beyond the reach of students attending most non-fee-paying schools is no less an issue, though with some exceptions in a small number of national contexts including, for instance, Ecuador where 72% of its 254 IB schools are state-funded (Hill, 2022). Recent analysis by Tate (2022) of the place of international schools in current debate arising from Goodhart's identification of 'Anywheres' ('a large minority group of the highly educated and mobile') and 'Somewheres' ('a larger and less influential group ... who are more rooted and less well educated') (2017: vi) raises related questions as to the potential of international schools, however ideologically-focused, to exacerbate differences in our rapidly changing world.

Going forward

This chapter has so far provided an overview of the international school sector from its earliest days, and in doing so has highlighted a number of challenges facing the sector as its *raison d'être* has changed in response to the changing global environment. From individual schools established principally to meet local needs of globally mobile expatriate families, an international school 'sector' has developed of some 12,300 schools (as at July 2021: ISCR, 2021b) which either claim to be international or might be considered as such on the basis of their characteristics, while acknowledging that the number could be somewhat larger if similar schools are included that do not meet ISCR's English-medium criterion. While to what extent international schools do actually form a 'sector' is debatable, given the diversity of the institutions and the absence of any overarching body with authority to determine whether a particular school may describe itself as such, major differences evident between the present day and the earliest years include the emergence of *groups* of international schools such as elite schools from a national context (for instance the UK's Dulwich and Harrow) and other groups including Nord Anglia and GEMS. And while the vast majority of international schools are fee-paying (with some notable exceptions such as the Netherlands-based Dutch International Primary Schools and Dutch International Secondary Schools, and those already noted as offering the IB Diploma in Ecuador), and 'not-for-profits' feed back surplus funds into development of the school (the basis of many of the earlier international schools), those for which surplus funds are channelled as profit to owners, shareholders and investors have become a clear trend in very recent years, with the majority of new international schools established on a commercial basis. The changes in nature of international school student populations is clearly an associated phenomenon, with the vast majority of international school students no longer the globally mobile expatriates for whom such a school facilitated relocation with a parent's professional mobility, but rather the elite and aspirational middle classes in developing countries for whom an international school education and internationally recognised pre-university qualification provide a stepping stone to membership of what has been described as the 'transnational capitalist class' (Sklair, 2001).

The rapid changes in even very recent years, with notable growth in particular contexts including but not limited to China, suggests that the international school 'sector' is likely to continue to change and develop in coming years. As the 'sector', and associated curriculum organisations, grows, its interest as a focus for academic research will undoubtedly also grow. A focus on international schools has already been noted as one of the main areas of research in international education (Dolby and Rahman, 2008) and seems set to be the basis of increasing scrutiny and critique by those with interests both in this specific context and in related areas. Questions increasingly being raised in the growing international school research base include, *inter alia*, those related to the nature of international schools (see, for instance, Bunnell et al., 2017), leadership of international schools (Keller, 2015) and teachers in international schools (Bailey, 2015).

Likely also to be of increasing interest in the international school context are areas that, while not unique to this context, may have particular relevance where mission statements and ideologies claim the development of attributes in students including respect for others, international mindedness and global citizenship. So, for instance, the Black Lives Matter movement's highlighting of issues relating to equality and diversity, and the focus on decolonisation of the curriculum in many contexts (see, for instance, Aman, 2017) will almost certainly be increasingly prevalent in the coming years – as will the expectation of a proactive role from international schools in ensuring that global topics including the Climate Emergency will continue to have high visibility in the curriculum.

Anticipated growth in use of technology in education, though again not unique to the international school context, may be expected to be associated with notable changes in the teaching and learning process. The global pandemic's impact on schooling has opened the eyes of many educators and students to the benefits of technology, with earlier speculation about a possible model for the future of international schools being one that relies less on buildings and more on remote interaction (Hayden and Thompson, 2013) becoming, as a result of COVID-19, a reality far more quickly than could ever have been anticipated. And not only increased use of technology, but also advances already being made in Artificial Intelligence, Virtual Reality and Augmented Reality are clearly likely to influence developments in the coming years (see, eg, MacDonald, 2022). Though not discussed here in any detail, two other issues may be expected to be the focus of continuing debate. One very pragmatic question relates to those who teach in international schools. In earlier days, almost exclusively expatriate and largely from a limited number of western, English-speaking countries (except for specialist teachers of local language and culture), as the numbers of schools have grown so has the diversity of teachers – though many schools still struggle with pressure from parents to appoint only first language English speakers and,

some would argue, underlying discrimination may be found in at least some contexts in favor of white, western, western-educated applicants. Already a hot topic too in relation to teachers in international schools is the question of just how the rapidly-growing number of schools will find the increasing numbers of teachers needed to sustain them. And if these growing numbers of teachers are to be recruited not only from the Global North, challenging issues arise about the ethics of relatively wealthy schools attracting from the home context in which they were educated teachers who leave behind shortages in a local, less well-resourced, education system. While, for many expatriate teachers, a short time spent teaching in international schools, or even a career developing from an initial foray into the international school world can be rewarding, exciting and stimulating, the precarity of the context (Bunnell, 2015), with short term contracts and little of the security that might be expected by teachers in national contexts, needs also to be acknowledged.

There can be few forms of education that have followed quite such a rapidly changing trajectory in the past half century as have international schools. From the origins of individual institutions established to cater for a local need, they are emerging as major influencers in an increasingly globalised world, arguably contributing to growing societal divides and facilitating the growing gap between 'Somewheres' and 'Anywheres' (Goodhart, 2017; Tate, 2022). Although the phrase 'international school sector' is widely used, there has arguably never been a 'sector' as such; nor does it seem that the existence of such a thing is closer now than it ever was. It may well be time for the concept of an international school *sector* to be abandoned, given the impossibility of making meaningful generalisations that apply equally to schools catering for expatriates relocating temporarily abroad, as to schools established principally to cater for aspirational local families in developing countries. Indeed, as noted by MacDonald (2022: 222), 'International schools catering primarily to host country nationals are often filling a void in the local independent school market ... [and] ... have become *de facto* independent school networks', citing the United Arab Emirates and Thailand as two examples. Though times have changed since Hayden and Thompson's (1995) description of international schools as a 'conglomeration of individual institutions', it is still the case that it would be misleading to assume that international schools in general share specific characteristics common to all.

Some would argue that the earlier forms of international schools are closer to the concept of a 'true' international school than those that have developed more recently. We would argue, however, that it does not need to be the case that one type of school can be assumed to be superior to another. Particularly given the lack of clarity with respect to terminology, and that programmes such as those of the IB, Cambridge and Fieldwork are offered across different types of schools, it cannot be assumed, for instance, that a for-profit school is by its nature somehow deficient in the international nature of the education offered compared with that of a longer-standing more traditional not-for-profit institution. Were it the case that a global organisation had the power to determine whether a particular school could be described as an international school, this is clearly a time when directives as to terminology would be beneficial to all concerned. In the absence of such authority, a lack of clarity is likely to continue. This does not, however, prevent international schools from being an increasingly high profile and influential contributor to education worldwide, and an important focus for research by those with interests in international education and its associated areas.

Introduction

Much could be written about the multiple dimensions of the current phenomenon of the *International Baccalaureate* (IB)—its presence, growth and impact in the world, as well as its uptake in the academic literature. Therefore, I want to make explicit my approach to constructing this entry. First, to fully appreciate what IB represents today, it is vital to consider its history. And it is critical to understand not only how IB emerged in the field of a small set of multilateral international schools in the 1960s (Peterson, 1972; Mayer, 1968), but to differentiate the conditions of this past historical moment to those of today (Scott, 2004; Tarc, 2009, 2011). There are instances when policy expressions from the period of IB's creation have been read through the filter of the (21st-century) present, misconstruing what was meant by those expressions and, by consequence, misrepresenting the past's mark on the present.

Moreover, with the current mainstreaming of terms like “global citizenship” sloganized across multiple organizations, it is easy to forget that it is only relatively recently that nation-states have been more sympathetic to such terms as “global citizenship education” and to forms of internationalizing education, given the traditionally tight grip “sovereign” nations have held upon their (idealizations of) state schooling (Heater, 1980; Tarc, 2009). Indeed this shift, beginning in the early 1990s, represents a core feature of the “shifting geopolitics of education” under globalization. Accordingly, to understand the character and development of IB requires an examination of the larger conditions that have shaped its concrete manifestations and evolving policy rhetoric on its purposes, achievements, modifications and plans. On the current (2020) “about-the-ib” webpage, viewers confront IB's long-standing aspirational vision, “Now in our 52nd year, we're more dedicated than ever to developing international education that creates a better world” (ibo.org). This aspirational goal, of making a better world through a progressive education for “international understanding,” has endured since IB's inception. However, how these aspirational visions are expressed and manifested in practice are enabled and constrained by institutional and regional pressures/agendas and larger temporal conditions (Tarc, 2009).

Second, the official stories that IB leadership tells of IB represent only one part of the reality of IB. The other part is what happens on the ground, why and how schools, universities, governments and families open to and (potentially) adopt or use IB. These parts reflexively inform one another, but they also produce discord, contradictions and tensions. IB, then, is constituted by both top-down governance and policy as well as bottom-up engagements, above and below the IB organization's core function of providing its four educational programs in schools. For this reason, I employ in my title the more performative terms, “meanings and uses” of IB, consistent with a pragmatist lens (Rizvi, 2014). From this perspective, IB is not some essential “thing,” but has flexible meanings and tangible uses and intended and unintended effects across the diverse contexts in which it is adopted and engaged. These meanings and uses (and tensions) are mediated by a confluence of factors, such as the following: larger conditions of neoliberalization (exogenous and endogenous to nation-states), IB's policy rhetoric and governing practices, state and university admissions policies, school/curricular practices and the (cosmopolitan) perspectives and (global) class-making strategies of IB users' families.

Finally, the section on the historical development and evolving tensions of IB, that situates international education under the globalization processes of recent decades, is mainly derived from a periodization of IB presented in my book, *Global Dreams, Enduring Tensions: International Baccalaureate in a Changing World* (2009). For greater explication on the historical development of IB and how the three structuring tensions (citizenship, curricular aims and operational function) find altered dynamics across time, readers can turn to this 2009 publication. Given the date of this publication, I have particularly considered the literature on IB published in the last decade; further, I have reviewed more recent IB policy statements to extend the analytic trajectory of the *Global Dreams* text. For additional historical analyses of IB, see Bagnall (1994), Bunnell (2008), Fox (1985), Hahn (2003), Hill (2002a,b) and Peterson (1972, 1987).

The phenomenon of IB

As of July 2020, the IB Organization reports that there are 7002 IB programs offered in 5284 schools in 158 countries; about 52% of these schools are state-funded schools (ibo.org/programmes/find-an-ib-school/, accessed, Nov 25, 2020). From 2015 to 2019, the numbers of IB programs adopted increased by a significant 37.9%. Adoption of the IB programs by schools is geographically uneven particularly with IB schools in public sectors. Just over half of the IB schools are in “The Americas” (predominantly in the US and Canada). “Africa, Europe and the Middle East” have about 21% of the schools (despite recent growth, Africa accounts for only 2.3% worldwide). And the “Asia-Pacific” region accounts for about 27% (ibo.org/programmes/find-an-ib-school/, accessed, Nov 25, 2020). 2018 statistics analyzed by Bunnell (2020) are illuminative:

Put simply, in 2018 there were at least 53 nations where there existed authorized “IB World Schools” yet zero public schooling activity, whilst four nations (Australia, Canada, Ecuador, and the United States) accounted for 81% ... of the IB’s overall body of public schools.... In most parts of the world, the IB (still) operates out of a traditional, private and relatively elite schooling mode of activity. (p 60)

Thus, apart from a handful of unique arrangements with governments and IB (such as in the cases of Ecuador and Sweden), the majority of IB publicly funded schools are located in the Anglo-West; while, in “developing country” contexts, most IB schools are private institutions, primarily serving mobile and national elites.

The IB is run by a non-profit foundation registered in Switzerland. In the most recently published Annual Review (2018–2019), the Director General, Siva Kumari reiterates IB’s “three business areas:”

Working closely with our passionate community of educators (over 5000 schools in more than 150 countries), our mission inspires us to continual improvement in all aspects of our work in our three business areas: curriculum development, working with schools, and assessment. (ibo.org/about-the-ib/facts-and-figures/ib-annual-review/year-in-review-2018-2019/a-message-from-dr-siva-kumari-to-the-ib-community/, accessed on November 25, 2020).

Centering IB’s “work” is the provision of four preK-12 educational programs; the 5000 plus *IB World Schools* offer at least one of these programs to their students. The *IB Diploma Program* (IBDP), the longest-standing and most popular program (offered by more than 3500 schools), is provided for students aged 16–19 years; it officially began in 1968. The *Middle Years Program* (MYP) for ages 11–16 began in 1994. The *Primary Years Program* (PYP) started in 1997 and is for children aged 3–11 years. More recently, in 2012, IB launched the *Career-related Program* (CP) for 16-19-year-olds that leads to “further/higher education apprenticeships or employment” (ibo.org/programmes). Currently there are 274 schools offering this new program. The IB’s website (ibo.org) is a well-updated site hosting materials and comprehensive details on its mission, philosophy, governance structure, finances, operations, history, curricular programs, geographic spread and growth, annual review statements, research summaries on IB, IB events and initiatives (some showcased in the “IB World” magazine), etc. This entry will not provide a description of the various elements of IB; the website is a good source for accessing these details.

Beyond the increasing numbers of authorized IB World schools and users of IB programs and IB courses in the K-12 private and state-funded sectors, IB has found notoriety in additional arenas. On the one hand, IB has a growing presence in national and transnational educational policy spheres (Tarc, 2009; Tarc and Beatty, 2012); on the other hand, the IB has entered new domains to spread its influence (Tarc, 2009). For example, across the last two decades, IB has partnered with multilateral policy actors and philanthropic foundations on non-IB educational projects. More recently, the IB has partnered with a select number of universities’ faculties of Education. In concert with the IB organization, these faculties now offer *International Baccalaureate Education Certificates* (IBEC) in or alongside their preservice teacher education or graduate education programming (see ibo.org/contentassets/f23b082dbc184e379a5bec2d42009e73/ibec-2020-university-directory.pdf). Additionally, the 2018–19 *Annual Review* highlights new partnerships and projects with the governments of United Arab Emirates, Japan and South Korea, and the launching of a Master of Education program with the University of the People to offer “a tuition-free online university degree to benefit teachers worldwide” (ibo.org/about-the-ib/facts-and-figures/ib-annual-review/year-in-review-2018-2019/impact/ accessed on July 22, 2020). Such examples illustrate the IB Organization’s commitments to “service” and having “impact” beyond its core mandate of providing its four educational programs.

Anecdotally, a good number of colleagues and acquaintances over the years have incidentally mentioned IB; I am always intrigued to know what they mean by it. As suggested above, the IB has multiple meanings and uses; and, as I have argued (2009), this flexibility of IB has been instrumental to its widespread adoption and financial sustainability. Is IB a cosmopolitan social movement (as implied in DG Siva’s invocation of a “passionate community” above and as showcased/advanced in the IB World magazine and various IB networks, blogs and groups)? An education for global citizenship (Dvir et al., 2018) or international mindedness (Hacking et al., 2018)? A private school education (within a publicly funded school) for only the price of examination fees (Tarc, 2007)? An inquiry-based pedagogical model (Twigg, 2010)? A “gold standard” (of quality) for well-established international schools (Lauder, 2007) and/or for the fast growing, for-profit sector of Anglo-Western-inspired international schools (Waterson, 2016)? A liberal—but not political—model of international education (Tarc, 2011) acceptable to more authoritarian nation-states? An UN-inspired infringement on state schooling in the US (Bunnell, 2012)? A model of gifted education (Kyburg

et al., 2007; Poelzer and Feldhusen, 1997)? An “international passport” to elite universities in the West (Lee and Wright, 2016)? An academically challenging program for US Tier One/low SES schools (Mayer, 2008)? Or a school choice option for (upper-) middle class families (Doherty, 2009)?

As reported in the literature, IB is understood and used in each of these ways depending on the context and stakeholders involved. This malleability has proven useful for the IB’s viability across contexts and across time, but it also has produced concerns and tensions that require labor by the IB organization to assert and re-assert its authorship over the IB brand/ideals. I will continue to address this malleable feature of IB as it (in)forms the research literature and the terrain upon which IB policy is (re)formulated and the ongoing cultural production of the IB brand.

Research on IB

As a “learning organization” (Tarc, 2009), the IB is invested in research in terms of better understanding and improving upon its programs and operation, as well as to leverage findings to build its reputation and deepen and broaden the IBDP’s acceptability to university admissions offices (and state educational ministries) globally. As Resnik (2019) asserts: “IB research is one of the main nonhuman actors that encourages DP recognition ...” by universities (p. 347). Thus, the research IB does on IBDP students’ readiness for, or success in, university programs becomes part of the way that IB inserts itself into the national; positive research findings thus act as a “non-human actor” in a larger “assemblage” of actors influencing university admission policies on the IBDP. Such evidenced-based research also allows IB to more legitimately participate in the performative cultures of transnational policy making spheres alongside more prominent agents as OECD or UNESCO.

IB has also increasingly come on the radar of academic researchers, including graduate students. The malleability and multidimensionality of the IB is well reflected in the growing number of research studies engaging IB. Research on IB crosses a broad spectrum from more insider or practice-based studies, conducted or commissioned by the IBO, that investigate (some dimension) of IB with a focus on evaluation or improvement, to more outsider or academic research that takes IB as an exemplar of a particular form, or proxy, of education (such as gifted education) or as a window onto a larger phenomenon (as school choice for class making). In these latter approaches to research, the aim is to illuminate the form of education or the larger phenomenon more than features intrinsic to IB. However, there are also insider studies that engage larger questions of educational aims or methods and use IB as the example, and academic research that does more intrinsically study the IB. The IBO hosts a research page (ibo.org/research/) which profiles IB in-house and IB commissioned research categorized as either “outcomes research,” “curriculum research” or “policy research.” They also have commissioned and posted annual annotated bibliographies inclusive of academic research conducted on IB for the period 2010–19. These bibliographies, conducted by university academics, cite and provide abstracts of academic journal articles, theses and dissertations, book articles, reports and conferences (see ibo.org/research/research-resources/).

A review of these sources as well as cited sources found through educational database searches surface common strands of research on the IB. A number of studies take the IB programs as a prominent exemplar of international education (for example, Hill, 2007, 2012); some studies more particularly engage the tension between the idealist and instrumental agendas or visions of international education in a context of globalization (Cambridge and Thompson, 2004; Gardner-McTaggart, 2016; Hill, 2006); relatedly some studies engage the (philosophical) mission or cultural affinities/translations of IB (Drake, 2004; Hayden and Wong, 1997; Lineham, 2013; Rizvi et al., 2020; van Oord, 2007; Wells, 2011). A number of studies examine the trends and prospects of/for IB in specific geographic areas, such as Australia (Kidson et al., 2019) and China (Wright and Lee, 2014). One of the more developed strands of research employs sociological analysis to illuminate IB’s use as a choice option with neoliberal school reform and how IB offers advantage or distinction for (global) class making (Doherty, 2009, 2012, 2013; Doherty et al., 2009) along the schooling to university trajectory (Wright and Lee, 2019). These strands make evident the multidimensionality of IB and the roles that IB plays in education and in educational markets worldwide, as well as the ongoing salience of IB as an object of scholarly research.

Most compelling, perhaps, is the IB organization’s enduring viability and strong reputation as a non-state provider of progressive curricular programs for “international mindedness” and its attendant teacher professional development and examination/oversight regimes operating for more than half a century (Tarc, 2021). Also striking is the character of IB’s global geographic dispersion and significant entry into, and ability to work within or alongside, state-funded systems. How has the IB navigated such a complicated terrain, and for so long? How (well) does it hold to its “global dreams” (Tarc, 2009) of making a better world through education? How does it respond to the dynamic tensions that arise as the “dream” enters the practical realities across different geopolitical and cultural contexts? As IB expands, how does it ensure quality of its programs (Charleson, 2010) as well as remain distinctive, and thereby desirable, in light of competition (Doherty, 2013)? What are the current trends and prospects for IB (both functionally and aspirationally) in a still hyper-connected, uneven world, now in further global crises? (How) will/might IB (continue to) be a global agent, as well as a reflection, of educational reforms in the shifting geopolitics of education? These questions are very salient for current and future scholarly research on IB. Some of the historical and analytic material to support these prospective inquiries is offered in this entry.

The following subsections focus more specifically on two research strands most relevant to this volume’s focus on the shifting geopolitics of education. The first strand takes IB as an exemplar of international education under globalization and the second strand takes IB as constitutive of internationalization processes of K-12 schooling. My approach is to draw a distinction between international education and its variants as a long-standing set of educational ideals, practices and initiatives (Elvin, 1960; Good,

2020; Heater, 1980; Méras, 1932) and the internationalization of education as a more recent trend emerging from the 1990s under processes of neoliberalization (Tarc, 2019; Tarc et al., 2012). This distinction is useful to differentiate older and newer modalities of international education with their potentially different objectives or animating visions. It also parallels the distinction between the *literal* definition of international education as educational activities crossing or connecting across political borders and the *ideal* of an outward looking education for international understanding (Tarc, 2019). Internationalization of education as a recent trend entails both the literal and aspirational definitions of international education, but the larger neoliberalizing conditions that drive internationalization agendas from above, favor the literal and “instrumental” definitions over the “ideological” or “educational” (Stier, 2004). Consequently, IB’s adoption may have more to do with “international education” than “internationalization” or vice versa; but the point here is that these empirical and normative differences matter. Considering IB as an exemplar of international education (as in educating for international understanding) leads to a different set of questions (and critiques) than considering it as an exemplar of the internationalization of K-12 schooling (as supra-national presencing in state schooling). Of course, linkages need to be made as part of the analytic, but under-thought confluences risk clouding research aims and findings.

IB and the shifting geopolitics of education under globalization

This section presents two specific analytic strands most relevant to this volume’s theme of “globalization and the shifting geopolitics of education.” The first strand considers IB as an exemplar of international education and the trends and prospects for the 20th century dream of international education under the unfolding 21st century conditions. The second strand centers on the internationalization of K-12 schooling, where “IB is [taken as] an emblematic case of educational globalization” in terms of “de-nationalizing” state schooling (Resnik, 2012, p. 249) or “school internationalization” (Engel et al., 2019). For this second strand, I read Resnik (2012) article, *The denationalization of education and the expansion of the International Baccalaureate*, with and against Bunnell (2020) recent article, *The “internationalization of public schooling” in practice: A “skeptical reality” approach*.

IB as a window on (Anglo-Western) international education

While the idea of an international baccalaureate was not new in the 1960s when IB came to life (Hill, 2002b), there was, at this time, sufficient practical demand for an internationally-recognized secondary school leaving diploma, to facilitate expatriate families’ access to home-country universities in the West (Peterson, 1972). The practical necessity and logistics of developing an internationally recognized diploma for multilateral international schools was foundational to the development of the IBDP. However, equally foundational, were the “global dreams” of IB (Tarc, 2019)—the progressive educational and cosmopolitan visions of the creators and supporters of IB to develop an innovatory educational program for international understanding. For most of the 20th century “international understanding” was the dominant signifier of the pedagogical goal of international education (Heater, 1980; Tarc, 2009). More than representatives of their own national systems, founding Director General (DG) Alec Peterson and his collaborators were largely educational reformers, critical of encyclopedic (and nationalist) approaches to schooling (Mayer, 1968). They envisioned an education for international understanding as a humanist “education of the whole person” (Peterson, 1972; Renaud, 1974), where students would study across the humanities, arts and sciences, engage a second language and experience social service and aesthetic activities. IB had a lineage to the Kurt Hahn-inspired service/outdoors movement, as well as to the relatively independent English private schools’ movement. While a regime of centralized examinations would be IB’s method for ensuring a level of standards for university acceptability, the program was aimed at deepening students’ understanding of the world through disciplinary and interdisciplinary study which included the cultivation of the moral and the aesthetic (Peterson, 1972). In the founding period of IB, a classical progressive education in the internationalist milieu of multilateral international schools and their communities was the means to international understanding (Tarc, 2019). For this non-state actor, a multimodal examination regime would allow for the steering of a curricula for international understanding and be the accountability mechanism needed to gain acceptability from university admission offices (Tarc, 2009).

The following six books are particularly illuminative of the *time-space milieu* of IB’s creation and experiment in the mid-1960s to early 1970s: Leach (1969) *International Schools and their Role in the Field of International Education*, Mayer (1968) *Diploma: International Schools and University Entrance*, Malinowski and Zorn (1973) *The United Nations International School: Its History and Development*, Renaud’s (1974) *Experimental Period of the International Baccalaureate: Objectives and Results*, Peterson (1972) *The International Baccalaureate: An Experiment in International Education*, and Peterson (1987) *Schools Across Frontiers: The Story of the International Baccalaureate and the United World Colleges*. These books provide a glimpse of the ethos, motivating ideals, practical realities and concrete problems and logistics that represent the contextual features of the community of IB creators and supporters (many of whom were teachers) that brought the IB to life in a historical moment that is quite distinct from our current one.

The confluence of the idealist educational/cosmopolitan visions and the practical demands and logistics produced a set of tensions that have endured from the period of IB’s creation and experiment (1962–73) to the present day (Tarc, 2009). In the historical moment when IB emerges, three core tensions constitute the “international” of IB:

The structuring tensions of IB emerge from the interplay of the dream of international understanding and the functional operation of an international diploma at work in the world. The term "international understanding," on its own, is under tension as an educational aim in a historical period when a dominant purpose of schooling was to produce loyal national subjects. The educational ideal of IB as a progressive education of "the whole person" is in tension with the need for IB to have internationally acceptable standards for university entry. And the ideal of IB representing a modern, forward-looking model of schooling, oriented to making a more peaceful and humane world in a historical period of democratization movements, becomes strained where IB was effectively used by a social elite. These three examples signal the core tensions of the "international" of IB in the founding moment.

Tarc (2009, p. 23).

The first tension of "citizenship," thus, centers on the IB's mission of developing international understanding when schooling is to foster national understanding and loyalties. Although international understanding was not contentious within the communities of the participating multilateral international schools, the IBO had to temper its internationalist sentiments in seeking recognition and funding from national governments and institutions. In its policy statements, IBO's predominant focus is on the forms and aims of the IBDP education and assessment (Tarc, 2009). Where international understanding is discussed explicitly, the IBO emphasizes that students first must identify with their national identity and later develop an openness to other nations and cultures (Peterson, 1972). Additionally, the IBDP is consistently described as a "complement to," or as a potential "laboratory" for, national schooling (Peterson, 1972).

The second and more consequential "curricular tension" is explicitly stated by Peterson (1987):

One of the problems which from the start face the IBO in developing an international curriculum was the tension between the academic requirements of university entrance procedures and these personal requirements of the whole human being growing up in an interdependent world. (p. 199)

Thus, as with progressive education more generally, the innovatory and progressive elements are constrained by demands for standards and accountabilities. In the case of the IBDP, deputy DG Gerard Renaud admitted that some university stakeholders working with the IBO had "dictated the content of some programs ... and sometimes imposed a greater degree of conservatism than the promoters of the experiment desired" (IBO, 1972, p. 27).

Still, in these early years, the IBDP curricular structure and assessment regime were innovatory and potentially enabling of more progressive and internationalist pedagogies. In the first place, with the IBDP, senior secondary students in international schools were no longer required to be split up to study for national entrance examinations (Leach, 1969). Second, the examination system was nuanced and multimodal to mitigate the back-wash effect of teaching to the test and the use of rote learning approaches (Peterson, 1972). Moreover, the curricular design of the IBDP compelled students to study a range of subjects and take an innovatory "core" that included the Theory of Knowledge course, a student-initiated "extended essay" and the "creative, aesthetic and social service experience" (CASS). Additionally, there was room for individual schools to create a school-based syllabus (SBS) to address local interests. One of the core international schools participating in the creation of IB, Atlantic College, designed and offered a *Peace and Conflict Studies* course, which represents an example of the (still under-used) innovatory possibilities of the IBDP (Tarc, 2009).

The third "operational" tension refers to the disconnect between the larger internationalist-egalitarian vision of IB (emerging in a time of political decolonization and the democratizing and massifying of secondary and postsecondary schooling) and the not-so international character of the organization and program and with the elite social class backgrounds of the users of the IBDP. While the idea that international education could be massified beyond elites and that IBDP should be open for the "academically-able," the schools that offered the IBDP in the experimental period served socially elite families (Tarc, 2009). Limited access to the IBDP thus represented one pillar of the operational tension.

In terms of its inter-national make-up or representativeness, the IBO and the IBDP curricula reflected specifically the position-alities and perspectives of individuals from a small set of wealthy Western nations. These were the voices of consequence in terms of university partners and of the development of the program, curricula and assessment operation. On the one hand, the internationalism of IB signals the inclusion of perspectives from a multiplicity of nations; but, on the other hand, the international refers to a "chain of equivalencies: West = democratically advanced = modern = international" (Tarc, 2009, p. 42). "Representation" thus represents the second pillar of the operational tension:

For the IBO, the structuring tension of representation in the founding period is produced out of the desire to include national perspectives and voices within a hierarchy of [assumed] relevance and expertise. University entrance requirements in England, Switzerland, Germany and France, needs of Anglo-American international schools for the mobile elite and recommendations of funders and other liberal-minded enthusiasts magnify the influence of particular perspectives and voices over others. (p. 42–43)

Given the enormity of the task to secure funding and support to create and pilot the IBDP, the IBO seemed positioned to be able to respond to these tensions only with aspirational commitments to enlarge access and internationalize representativeness over time.

Analysts of IB in contemporary times will recognize that these tensions have endured, sometimes presented as critiques of IB. For example, lack of access to the IB programs continues to be a point of critique (Dickson et al., 2017). In response, the IB organization, continues to be actively and strategically engaged in broadening access to the IB, as I will detail below. Nevertheless, as the IB has moved through its phases of “creation and experiment” to “growth and sustainability” to “diffusion and diversification” to “branding and impact” over the last fifty years, dynamics of these tensions have altered (Tarc, 2009). Most obvious is that, for the most part, international understanding as an aim of education is no longer contentious; indeed, many governments advocate for it as a component of human capital development in a globalizing world (Green, 1997). For a more detailed analysis of the shifting dynamics of the tensions and how the IBO navigates them in a changing world, refer to the Global Dreams text (Tarc, 2009). In the remaining part of this **Introduction** section, I will outline the most significant continuities and discontinuities of these tensions precipitated by larger 21st century transformations and the attendant responses of the IB Organization.

First, amidst the ascendancy of neoliberal economic globalization in the 1990s with the breakup of the Soviet Union, international education begins to move from a potentially politically contentious and marginal activity to an expedient (Tarc, 2009, 2013). For example, governments want globally savvy/mobile citizens who can contribute to the national economy, universities seek out international students as a new generation stream under declining public funding, businesses want interculturally competent employees who can exploit niche markets globally and students want to build their resumes with international certificates and experience (Tarc, 2013). Often entangled with these pragmatic agendas of this neoliberal internationalization movement come the more idealist/aspirational agendas privileging the potential educational, cosmopolitan and ethical potentialities of international education (Tarc, 2019). In this sense the “citizenship tension” of IB has largely abated. For only a fringe right, admittedly energized under the recent rise in strongman populism (Geiselberger, 2017), does international education remain contentious (for the US context, see Bunnell, 2012). In terms of IB’s diffusion and acceptance into state-funded schooling, IB’s mission of developing international mindedness or global citizenship is either inconsequential or seen as an asset by schools and ministries of education also open to the internationalization trend. What this change means is that rather than trying to minimize its internationalist vocabulary, IB’s international, becomes a “value added,” a marker of distinction (Tarc, 2009); for upwardly mobile middle-class parents, cosmopolitan capital is increasingly recognized and pursued as a form of cultural capital (Forsey, 2017; Weenink, 2008).

Today, neither the vocabulary nor the liberal-humanist pedagogy of international education is contentious. However, the larger political tension of international education’s aims and uses remains. The expediency of international education is tied into nationalist agendas and strategic capital accumulation of mobile elites (Ong, 1999; Tarc, 2013). Nationalist internationalisms have long been critiqued (Leach, 1969) and remain dramatically present and problematically at odds with the ideals of equity, reciprocity and dialog founding ethical internationalist engagements. In this sense, the citizenship tension has merged with the operational tension (access and representativeness). For example, where IB is used to further social advantage by elites or where IB curricula remain Eurocentric and complicit with hierarchizing societal and human value, the aspirational (world) citizenship goal of (massifying) international understanding remains stunted.

The curricular tension has endured but with changing dynamics. First, the centrally examined IBDP remains a college preparatory degree and thus the tension remains between the development of the whole person through a general education and the standards or accountability mechanisms¹ necessary to facilitate access to top universities. However, through the development of the younger-years programs (MYP, PYP), IB has moved forward in realizing its progressive educational visions. These programs are less academically content-rigid and therefore tend to better support the kinds of inquiry-based, thematic, interdisciplinary, progressive and innovative approaches to which the IB brand aspires. Given that IB still must ensure quality standards over the younger years program, there still exist constraints on innovation. However, it remains arguable whether the IB programs or the (national) school and community contexts in which IB is enacted represent the “bottle neck” to realizing more progressive, internationally minded or innovatory pedagogies.

As for the curricular tension within the IBDP, some studies have shown that many IBDP students find the IBDP program to be a very intensive and stressful experience (Hertberg-Davis and Callahan, 2008); my colleague and I (Tarc and Beatty, 2012) found in one IB World school in Ontario, that some IBDP students had to limit or eliminate their extra-curricular activities in sports, arts and service in the school and community, to fulfill the academic requirements of the IBDP. Obviously, this sole focus on academics contradicts the goal of developing the whole person through a general education.

IB leadership is aware of this curricular tension in the IBDP and periodically have discussed alternatives to its high stakes culminating examination regime, but the role of the examination regime in assuring IB’s “high quality” standards has much inertia (Tarc, 2009). Most recently, the IBDP’s 2020 Spring examinations were canceled due to the Covid-19 pandemic. In a recent interview, DG Kumari discussed the need to learn from the pandemic and IB’s responses to it and specifically of “plans to shift focus away from end-of-program exams.” She is reported stating:

Before Covid, we were already designing our strategy for the next 10 years and as part of that we have been having these conversations about the end program ... where this heavy-duty summative experience does not reflect the real world anymore. (<https://www.tes.com/news/international-baccalaureate-siva-kumari-exams-future-education-coronavirus>, accessed December 8, 2020)

¹Albeit, as one anonymous reviewer noted, IBDP’s examinations maybe less “high stakes” than the local jurisdiction such as with many Australian systems that use “norm-based” external assessment and moderate internal assessment with the external scores. In contrast IB employs “criterion-based” assessment and does not adjust internal grade components.

It is possible that the pandemic pushes “these conversations” forward and catalyzes a change in the status quo. Perhaps the IB brand has a solid enough reputation to maintain its high regard with respect to the quality and oversight of the programs without the IBDP high stakes testing regime. Time will tell.

Another key shift over time has been the development of IB’s focus on internationalizing IB curricula—supporting schools to be “internationally minded,” beyond providing international schools with an internationally-recognized diploma. Initially the IBDP enabled national groups to study together on a single less nationalistic curriculum. International understanding was implicit to the milieu of multilateral international schools. In the mid-1980s as IB found financial sustainability via the diffusion of the IBDP into state schools in the United States in Canada, IBO realized that an international student body could no longer be assumed (IBO, 1988). From the early 1990s the IB took a more conscious focus on the goal of international understanding (and later international mindedness) and its integration into its curricula. In its current “branding and impact” phase in the 21st century, fostering international mindedness is an overarching goal. Although still tied to a set of progressive learner dispositions of “open mindedness” and “inquiry”² the IB organization has become more explicit about its aim of fostering international mindedness and what that entails (IBO, 2017). In this important mission document with just over 6 pages of content, a full page is afforded to international mindedness. Significant also are recently conducted IB-sponsored studies, specifically focused on educating for international mindedness (Hacking et al., 2018; Singh and Qi, 2013; Sriprakash et al., 2014). Thus, IB now projects a more “positive” definition of international education (Tarc, 2009), that *any* school can work at.

The operational tension also remains significantly on the radar in IB’s rhetoric and reform policy (Tarc, 2009). As would be expected national/cultural diversity has expanded greatly in the make-up of IB policy actors and employees. New working languages have been added to the original languages of English and French. Curricular modifications have incrementally opened-up the Euro-centric beginnings of IB programs; for example, in 2015 Indigenous ways of knowing was formally added to the “knowledge areas” in the IBDP Theory of Knowledge course. Also, of note, is a recent push from IB commissioned research toward “intellectual equality” and “multilingualism” (Sriprakash et al., 2014) to inform IB’s conception of international mindedness, as its overarching pedagogical ideal. The Western-centeredness of IB, which can be attributed to its foundations and from the still hegemonic global status of Anglo-Western education, must be assumed. However, my speculation, to repeat, is that the IB curricula itself (especially the more open PYP and MYP) is probably more open to epistemic diversity than are the (national) contexts of IB school classrooms and teachers. Thus, we might say that the tension of the inter-national representativeness of IBO and of IB curricula have at least diminished somewhat.

In terms of broadening access, the IB has expanded beyond the more elite private international schools of its foundational period and entered state schools in the West; it has developed more accessible younger years programs, entered inner-city schools in the United States and the United Kingdom and entered partnerships with state schools in the global South (Ecuador). The more recent provision of the “Career-related Program” also represents an important access-broadening initiative. Still, criticisms remain of IB as elitist, as inaccessible, and as (unintentionally) furthering educational inequality given its use as a choice option within neoliberal school reform. For its part, the IBO began to prioritize its commitments to broadening access to IB programs in its 21st century policy discourse (IBO, 2006; Tarc, 2009). Given the 21st century zeitgeist of inclusivity and equity and given IB’s mission to massify international education, concerns around access and equity remain key pressure points for the IBO today (see the “E2” initiative, IBO, 2018).

As they made explicit in their Growth to Access document: “Today, over 1/2 million students from all continents have graduated from our Diploma Program but it is obvious that our goal requires millions of people worldwide to benefit from an international education (IBO, 2006, p. 2). In this key policy document, IBO makes it clear that despite a variety of their broadening access initiatives over the years, there remains very uneven access to IB, both geographically and in terms of social class. The policy document also includes a set of strategies and plans to mitigate this uneven access; while the past decade has seen incremental and singular instances of broadened access, in the larger picture, limited and uneven access remains a core challenge for IB. For example, in Dickson et al. (2017) recent examination of the Australian context, they find that “whether private or public, IB schools in Australia are overwhelmingly located in higher-SES areas and enroll students from higher-SES backgrounds” (p. 75).

In his DG report of 1972, Alec Peterson directly responded to IBDP student charges that IB is elitist, Alec Peterson suggested that IB could foster “intellectual elitism” over “social elitism” (IBO, p. 17). Here he was signaling how one’s education and academic performance might overtake social status and familial wealth in a meritocratic society. Perhaps, at that historical moment, the feasibility of dis-entangling educational elitism from social elitism seemed more credible. Despite schooling reforms for equality, catalyzed by the “new sociology of education” of the 1970s, social class and educational attainment have remained tightly correlated; we now witness countless ways in which familial cultural capital and resources are applied to facilitate academic success for middle and upper class families. As an education for distinction (particularly the IBDP) built on a “user-pays” model (Tarc, 2009), IB can little extract itself from these larger conditions of schooling and social class stratification. Consequently, the very neoliberalizing conditions allowing new models, as IB programs, into state educational systems, also steer the uses of IB education (as cultural capital) for social class advantage; and, given IB’s user-/institution-pays model that produces uneven access to its product, it is thus difficult to imagine how the operational tensions can be resolved.

²The “IB Learner Profile” sets out the following 10 “attributes” that “IB learners ... strive to be,” as follows: inquirers, knowledgeable, thinkers, communicators, principled, open-minded, caring, risk takers, balanced and reflective (IBO, 2017, p. vii). The profile, originally developed in the context of the PYP, is a key instrument of IB’s branding.

Historicizing the structuring tensions of IB, as outlined above, illustrates how IB articulates within and alongside state educational systems and private independent schools embedded in national settings. It also shows how the IB has been somewhat proactive in the internationalization of education as well as reactive to its flows and pressures. These tensions of IB, invoked by the encounter of its aspirational dreams with practical realities (structured by larger forces) are also resonant with internationalizing schools and universities, navigating the limits and possibilities for (citizenship) education in an interdependent and asymmetric world. The next section turns to IB's relations to K-12 school internationalization.

IB as a window on school internationalization

IB's diffusion in state educational systems can also be studied as an instance of the internationalization of K-12 schooling. In her 2012 article, scholar Julia Resnik offers a most explicit analysis of how the IB's insertion and expansion in state schools can be interpreted as a process of de-nationalizing education. From its foundation, the IB was designed and adapted to articulate with state systems for educational and qualificatory alignments and recognition. For example, as the IBDP expanded in monolingual areas of North America, a beginning-level language course was added to its previously more demanding second language course requirement (Tarc, 2009). However, state educational systems have also been changing under globalization and not only as passive victims to exogenous global forces. Drawing on Sassen's scholarship (2000, 2003) uncovering how globalization is advanced within national spaces and by state actors, Resnik asserts that "the theoretical significance of IB schools ... is that they embody the denationalization of educational systems" (p. 249). Consequently, "certain national contexts and educational traditions encourage IB schools, while others hinder their propagation" (p. 249). I would add that since these contexts and traditions are also in flux, IB's propagation and prospective sustainability (see Beech and Guevara, 2020) within countries or educational jurisdictions also shift across time.

The "global" forces or actors interact with national systems, institutions and processes in what Sassen (2000) calls "frontier zones" as distinct "spatialities" embedded in the national (Resnik, 2012, p. 251). Resnik offers a kind of spatial typology that is useful in breaking apart the different levels of global-local interactions that can be considered part of k-12 school internationalization. She lists them, in ascending order of *thickness of the global*: (1) the IB international brand, (2) the International Baccalaureate Organization (IBO), (3) IB regional offices, (4) international schools for mobile families, (5) private schools that recruit local children, and (6) public schools that recruit local children. (my emphasis, p. 251)

IB as brand is the most global, symbolic and least tethered to a national physical space, materialized with the IB logo stamped on all things IB. The IBO is a transnational entity, made up of individuals of different nations and working with multiple states; yet, it has a central headquarters in geographical space. The least global is the state school serving "local" children of which the "global" of IB has very little presence in relation to the totality of the school operations and processes. In terms of focusing on school internationalization within state systems over the "global" of IB, it is helpful to invert Resnik's ordering. Under this inversion the thickest form of school internationalization is represented by the presence of IB programs in the "local" public school, where students' learning and subject formation is (at least subtly) being shaped by a supranational entity. And the thinnest and most symbolic manifestation, but much more widespread, is the IB brand recognized by wider national publics without tangible experience with the IB programs *per se*. The recent instituting of IBEC partnerships with state teacher education programs, mentioned above, also represents a new and somewhat thick form of school internationalization in the de-nationalized frontier zone of the global (IB) embedded in the national (here, teacher education). Thus, internationalization of K-12 schooling, as de-nationalization, is thickest where students receive a compulsory, state-funded education in the local school provided by a supranational entity. However, given the very small percentage of IB schools and IB students (and educators) within state educational systems, the breadth of this thickest level of de-nationalizing seems extremely narrow. On the other end, the thinner forms reach a wider audience and influence/represent internationalization (as de-nationalization) in more symbolic ways that are admittedly playing a role but also more difficult to trace.

A recent article by Tristan Bunnell takes a more "skeptical" view of IB's role and influence in "the internationalization of public schooling in practice" (p. 56), emphasizing just how narrow this thickest form may be. In his article, he "seek[s] to show that in practice the extent of contact between the IB and public schooling is relatively scarce, small scale and minimally funded and prioritized" (p. 57). First, Bunnell emphasizes the uneven distribution, where public schooling activity is predominantly located in a minority of countries and in clusters of only "urban settings" within these countries; the government-funded growth in Ecuador is a case in point (p. 60–61). Further, while there are private international schools where a majority of students take the IBDP, in many publicly funded schools in the other top three countries with public IB schools (United States, Canada and Australia), a minority of students are enrolled in the IBDP; for example, sometimes there exists a small cohort of 20–25 students taking the IBDP within a school of one thousand students (Tarc, 2009). In the case of Ecuador, its 270 IBDP public schools had an average of 22 examination candidates per school (Bunnell, p. 62). Thus, the IB brand(ing), with its "5000+ IB World schools in more than 150 countries," belies the relatively small number of IB students and teachers in public schools and the very small numbers of IB schools in many of these 150 countries.

Bunnell concludes his skeptical framing by considering state funding and IB's reliance on "political champions." There are a few countries, as Ecuador, Japan and the United States "led by an IB-government assemblage" (p. 63), indicative of a distinctive spacialization of de-nationalization (Resnik, 2012). However, Bunnell (2020) continues, "very few governments directly support the IB, and it tends to involve relatively small grants of money" (p. 63). In the countries of the UK and the US, which have supported the adoption of IB programs through government funding, "funding is usually merely to cover the basic costs of applying for the

accreditation process, i.e., there is no long term funding available" (p. 63). Finally, IB's diffusion has continued to rely on individual influential contacts (Tarc, 2009) including, more recently, political champions (UK, City of Chicago, Ecuador). Where support is contingent on individuals and political outcomes, such support may not be sustainable.

Thus, Resnik (2012) illustrates dynamics of the denationalization of education via the propagation of IB in state schooling, across its thinner and thicker types; whereas, Bunnell (2020) provides cautionary statistics on the actual depth, scope and accessibility of the thickest type. Taken together we can see that the IB is indeed emblematic of transnationalizing processes, but the depth of these processes is questionable. My sense is that it is useful to examine all the types/levels in Resnik's typology and particularly their complex interactions, as they work together to produce denationalizing zones that constitute school internationalization. The IB branding works dynamically with the IBO's regional offices and the concrete manifestations of IB programs, to heighten the prominence and effect of IB. And while actual numbers of IBDP exam candidates, IB students and IB teachers remain low in relation to the "buzz" of IB, these actors have relations across multiple domains. For example, anecdotally, IB teachers talk about how teaching IB has positively affected their teaching in non-IB classes.

Both Resnik (2012) and Bunnell (2020) articulate such positive potential secondary effects. Resnik discusses "percolation" as the influence of aspects of the DP program ... on curricula and programs that are not related to the "IB" (p. 263). She provides examples from two state-sponsored schools in London, England that adapt the IBDP's innovatory core elements to provide critical thinking courses, extended inquiry projects and volunteering to the larger majority of non-IB students in the schools. These percolatory effects are particularly significant given IB's "horizontal networks of governance," where "teachers are trained by other teachers ... and a range of mechanisms for promoting the exchange of know-how and experiences among practitioners have been fostered" (Beech and Guevara, 2020, p. 104). This horizontality of governance and teachers' professional development explains why pockets of IB schools within certain geographies can be found, as in the country of Ecuador and in the city of Chicago, and why the IBO seeks to develop these close clusters of schools. It also explains how *private* IB schools are actors in the assemblage of school internationalization in the *public* sector. Additionally, within the public sector, this horizontality and teacher collaboration may percolate into non-IB schools under board level initiatives, including non-IB professional development and educator networks.

Bunnell also elaborates on this "ripple" effect by discussing research on IB public schools in Spain, Ecuador and Japan. In summary these (potential) effects included: energizing learning and extra-curricular activities and positive school culture for non-IB students, showcasing high academic approaches, model pedagogies and internationally minded educational approaches for other programs, schools and system-wide reforms (p. 64–65). However, not all ripple or secondary effects are positive. Researchers have also raised concerns of the negative secondary effects of bringing IB into state educational systems. These potential negative effects, which connect to the stratifying uses of IB under neoliberal privatizing reform already discussed, include: the potential negative effects of "IB-choosing" students exiting from local schools (Lauder, 2007); the funneling of resources to the already privileged mobile (Doherty, 2013; Tarc, 2009) and urban (Bunnell, 2020) middle classes; and the siloing of IB and non-IB student groupings (Culross and Tarver, 2007).

On the one hand, from a state schooling perspective, IB is implicated in the de-nationalizing of education that, in recent decades, have been challenging idealizations and practices of schooling as a territorially bounded activity of the sovereign nation-state. At the very least, the propagation and growth of IB into state educational systems represents a window on these de-nationalizing processes constituted by the mix of transnational (educational) policy forces and flows, national/ministerial sovereignties and (flexible) citizenships inside, and stretching across, borders. In some respects, IB is itself a transnational force in school internationalization, albeit with its program provision having limited scope, depth and accessibility (Bunnell, 2020).

From a more multilateral perspective, on the other hand, the IB is a salient exemplar of international education and, analytically, offers a window on how ideals and manifestations of an education for international understanding (toward a more peaceful, egalitarian world) have evolved across the last fifty years. Such analysis provides insights into the trends and prospects for international education and its variants under contemporary conditions. Both perspectives reveal how IB as implicated in the globalizing geopolitics of education.

Conclusion

To conclude, "IB" is a longstanding, multi-faceted and study-worthy phenomenon as a particular manifestation of international/progressive education, as a window on the shifting meanings and uses of (international) education in global times and as an enabler and manifestation of school internationalization. IB is a compelling exemplar of the heightened expediency of international education in the 21st century (Tarc, 2009, 2019). For many students and families, IB has proven to be an enriched and value-added educational program (Tarc et al., 2019). The IB organization has navigated relatively successfully across decades of global transformations, beyond its own making, to govern its core mandate of providing an IB diploma on a school-by-school basis. It has also expanded its activities to include younger-years and career-related programs and to seek out other initiatives and partnerships to "create a better world" through education. How IB has navigated, points to the larger conditions of globalization that have also animated the trend of internationalization of K-12 schooling. Concurrently, IB is also an agent in school internationalization across its different levels of embeddedness in national schooling.

IB's continued success raises several new and old questions that will require re-thinking and negotiation as societies and institutions respond to the regressive and potentially progressive forces catalyzed by the Covid-19 pandemic and its still uncertain aftermath. On the one hand, there will be pressures for IB to "up" its (discursive) commitments to social justice/anti-oppressive and

environmentalist pedagogy in the wake of the Black Lives Matter movement and given global ecological crises. A turn to anti-racist pedagogies, for example, would represent a shift given IB's emergence from, and niche uses in, the traditionally "color-blind" elite international schools culture (for example, David, 2020). On the other hand, the threat to liberal internationalism by the rise of populist nationalisms, border closings and trade-wars might mean that IB's viability finds more traction in the accrual of academic distinction and capital, over its promise of a humanist international mindedness or even the facilitation of global mobility. As with other educational providers, IB will have to respond to a confluence of social justice desires, the pedagogical needs of the learner (21st century learning) and the continued dominance of neoliberal performativity (Tarc, 2015). My sense is that, programmatically, it will continue to stick with its core foundation as a provider of a learner-centered liberal-humanist education, while, adapting rhetorically, to the wider conditions and cultural politics in a globalizing (and de-globalizing) world.

Introduction

The private sector of schooling has always been highly diverse. While much of the academic research and public discussion about private schools has long been linked to issues related to privilege and elitism ([Green and Kynaston 2019](#); [Peel, 2015](#); [Walford, 1990](#)), in practice, this focus has always been misleading. In most countries the private sector is very varied - while the best known schools may well be highly selective, expensive, and likely to lead to high-status universities, there have always been many other private schools that are far more modest.

It is worth remembering that historically all schools were originally private schools. Schools owned, funded, managed, and regulated by the state are relative newcomers in most countries. Generally, just two centuries ago it would have seemed a needlessly expensive and potentially dangerous activity to provide schooling for the poor, but now free universal basic education is perceived as a human right ([Aubry and Dorsi, 2016](#)).

Over the last few decades diversity within the private sector has been growing, and there has been an unexpected increase in private schooling in developing countries. Countries as varied as China, Mongolia, India, Nigeria, Uganda, and Vietnam have all seen a dramatic growth in the private sector of schooling - particularly at the primary level, but also at secondary. The schools themselves are very wide-ranging in nature. Some are very expensive and elitist schools for the wealthy or for ex-patriots living within these countries, but a major part of the growth of private schools has been those designed for local, often poor, families. The schools with the lowest fees may charge only a few US dollars per month, and have come to be known as “low-fee” or “low-cost” private schools. These schools are aimed at a target market of some of the poorest families in each of the countries, providing schooling for children whose families may be earning a few dollars per day. Where there has been a demand for private schooling a range of individuals, small groups, charities, and non-governmental organizations have stepped in to provide schooling for those who cannot afford the high fees of the elite schools, but are able and prepared to spend a significant proportion of their income on lower-fee private schools.

Definitions and the complexity of reality

There is no internationally accepted definition for “low-fee private schools.” This is not unexpected as there are no internationally accepted definitions for any of the four words that make up that phrase. Although many, even within the worlds of academia and of international development, use these terms as if they are internationally agreed, all four words represent simplifications of the reality that is to be found in the complex and ever changing world in which we live.

The concept of a “school” usually goes without question, but various countries have different ideas about what is to count as a school. There are obvious questions about how many children are involved, how old, for how long, for what proportion of the day or year, what subjects are taught, who does the teaching, and so on. Now that learning from the internet is ubiquitous, the idea that students need be gathered together in a physical space called a “school” comes under examination, and homeschooling has become a reality for many. When does private tutoring become a school? In terms of recognition and regulation, different countries, and sometimes regions within countries, have made different decisions about what should count as a school - which are totally ignored in most studies in comparative education.

But the problems of definition become far more complex when considering the term “private.” Private might refer to ownership, funding, management, or regulation of the schools. Religious organizations have been centrally involved in private provision in many countries for centuries. In many more-economically-developed countries they were the backbone on which schooling developed, and have become so much a part of the educational landscape that they receive substantial financial support from the state. In the UK, for example, the buildings of many religious schools remain in ownership of religious organizations, but most religious schools receive full per-pupil funding from the government, and are highly regulated by the state. In the Netherlands the majority of schools are officially private, but they receive full funding and even their buildings are provided by the state. This means that the distinction between private and state schools is often blurred, and whether a school is defined as being “private” or “government” depends on the history and politics of each country.

Similar problems can be seen in the words “low” and “fee.” What may be considered low in terms of international comparisons, may not be considered low by the families of the children attending these schools where they represent a considerable proportion of their income. For them, the fees are all they can or wish to afford. “Low” is operationalized differently in various academic research reports. Thus, for example, [Srivastava \(2006: 498\)](#) defined it as a fee “not exceeding about one day’s earnings of a daily wage laborer at the primary and junior levels, and two days’ earnings at the high school and intermediate levels”. Other studies have defined “low” in relation to state-enforced minimum wages, or a “poverty line” of US\$1.25 or US\$2.00 per person per day ([Tooley and Longfield, 2016](#)), or as a proportion of the country’s per-capita income, or per-pupil expenditure in government schools ([Kingdon, 2020: 13](#)). Any definition is ultimately arbitrary, for the schools are simply at the lower end of the fee scales for private schools in any particular country. Government statistics rarely take account of any such definitions and there is no evidence that parents, teachers, or owners of schools do so either.

What is to be included in the term “fee” is also contentious and some writers have used the term low-cost rather than low-fee to try to deal with this. Some use the word “cost” to indicate that families have to pay more than just the stated school’s fee for their children to attend (e.g. [Tooley and Longfield, 2016](#)). They may have to pay for books, school uniforms, examination entrance fees, transport, and other extras. For older children there may also be the additional cost of forgone earnings, as children often make major contributions to family’s income. The use of the term “cost” also allows metaphorical costs, such as the safety costs of lengthy travel, to be more easily included. For this type of low-cost, the schools are usually geographically near to the home, so may be considered to be safer for children (especially for girls) than a school at a greater distance. Other academics (for example, [Lewin, 2017: 82](#)) use the term “cost” to indicate a totally different consideration, where the cost is the per-pupil cost of providing schooling by the owner rather than the larger fee (or price) paid by the parents. Thus the profit made by the owner is emphasized, along with the reasons why schools are able to charge low fees.

In his edited study of India, Nigeria and Uganda for the Commonwealth Secretariat, [Phillipson \(2008: 1\)](#) adopts a very narrow definition of low-fee private schools that is described by what he does not consider to be encompassed by the category as much as what is to be included. He states:

It is not a school run by a non-governmental organization for charitable or developmental purposes. It is not a school run by a religious organization for the furtherance of a particular set of moral values and beliefs. It is not a school offering an educational advantage to its pupils and charging a high price for the privilege of gaining access to it. Finally, it is not a school set up by the local community until the government agrees to take over ownership. In contrast to these distinctions, the low cost private school is a school that has been set up and is owned by an individual or individuals for the purpose of making a profit.

This narrow definition is unhelpful, and it is not even consistently applied within the book itself. Not only are these distinctions not clear, in that there may well be multiple reasons for starting and continuing to run a school for the poor, the exclusion of non-governmental organizations (especially small, local NGOs), religious organizations, and those who might eventually wish to obtain some state funding, omits from consideration a huge part of the growth in low-fee private schooling. It also restricts our understanding of why such schools might be started and how the schools themselves, and the motivations for their continued existence, may change in nature over a period of time. Even the idea that they must “make a profit” collapses within the complexity of individuals and groups paying themselves salaries, or establishing schools so that they might gain employment. The vast majority of these new private schools were not (at least initially) the result of shareholders investing money in schools because they saw them as the way to obtain the highest financial return. The reasons for starting and continuing with the schools are much more complex, and there is thus the need to consider the whole range of non-government sector schools with low fees that are designed to serve some of the poorest families in each society.

Any generalizations about low-fee private schools, even within a single country, should thus be treated with great caution (including within this article). Readers of research on low-fee private schools need to carefully check the definitions being used and the sources of information cited. There are many cases in the literature where researchers do not adhere to their own definitions, and where the data sources are inadequate to support the claims made.

The development of low-fee private schools

Within the vast majority of countries there has been a range of private schools with fees from very expensive to relatively low fees for many centuries. A good number of major private schools in England were originally established in the 15th and 16th centuries as

schools for “poor scholars” in the local area. While there is some doubt about who was defined as a “poor scholar” (Orme, 2008), these schools certainly provided some students with free schooling. Meanwhile most children from poorer families had to make do with dame schools and other local fee-paying provision. Many children had little schooling, but church and other private organizations provided a basic level of schooling to many others. It was only as late as 1870 that the British government began to build a national system of schools and, even then, its initial purpose was to fill the gaps in private and charitable provision rather than to provide schools for all.

Tooley (2009: 212–234) argues that in the early nineteenth century India had a somewhat similar system of local private village schools which it was estimated in 1826 provided for about 25% of boys. With the addition of home schooling, about a third of boys were being schooled and, most interestingly, many of these boys were from lower caste families paying very low fees. These schools were later replaced by European-style schools which, in 1931, Mahatma Ghandi argued were too expensive for the poor, leading to the result that “today India is more illiterate than it was fifty or a hundred years ago” (quoted by Tooley, 2009: 212). Ghandi called for a revival of this type of low-fee private school in India, and Tooley and others found what might be seen as their reincarnation in the low-fee private schools in both rural and urban areas in India and in other countries in the late 1990s and 2000s.

Although the growth in low-fee private schools probably started in the 1980s, it was in the late 1990s and early 2010s that academics and others gradually became aware of the rapid increase in school designed to provide places for poor students in the less-economically-developed world. A range of reports, papers, and books such as those by Majumdar and Vaidyanathan (1995), Kitaev (1999), The PROBE Team (1999), and Tooley (2001), and those involved with international development policy used a variety of terms to describe these schools such as “budget schools” (Tooley and Dixon, 2005), “schools for the poor,” “new private schools,” and so on. The term “low-fee private schools” was first used to describe these schools by Srivastava (2006). The phrase has been widely used since but, as discussed above, has not gone unchallenged. As the role of these schools in educational provision for the poor is highly contested (discussed below) the terminology used by the various stakeholders varies so as to emphasize particular aspects of the nature of the schools.

It is important to recognize that the growth of low-fee private schools took place in parallel with the development and some progress toward the Millennium Development Goals for education where free basic education for all children was seen as a Human Right. Their growth might be seen as a reaction to the failure of various countries to provide schooling of an appropriate quality and effectiveness, and various authors saw them as vital part of reaching Millennium Goals. Now the focus is on Sustainable Development Goals and the extent to which low-fee schools might be promoted and supported by international aid, other funders, and by the governments of these less economically developed countries to achieve those Goals. This is a highly politically contentious area, and most researchers in the field are probably either advocates or critics of the involvement of non-state actors in education, especially if those actors wish to make a profit.

The study of such schools became particularly important when it was argued that low-fee private schools were playing an important part in achieving *Education for All* targets and the Millennium Development Goals. For example, Tooley and Dixon (2007), Tooley et al. (2007) suggested that the many low-fee private schools that were practically unknown to the governments of, for example, Ghana, India, Nigeria, and Pakistan, were making a substantial contribution toward meeting those targets. In contrast, others such as Lewin (2007), argued that the contribution that private schools made to the achievement of *Education for All* was small. But the work of such critics often relied on government statistics and interviews with high ranking administrators neither of which, as Tooley (2009) and others described, usually knew very much about the existence or nature of low-fee private schools in their own countries. One of the themes throughout Tooley’s book is the way that government officials, university academics, development advisors, and educationalists continually denied the existence of such schools in their countries in the early 2000s yet, by going into the slums and poor districts of so many developing countries, researchers were able to locate very many such schools. Many parents had rejected the schools provided by the government (where they were provided) and decided to devote a large proportion of their incomes (but a small actual sum) to the fees for local private schools. Most of these schools were entrepreneurial schools in the sense that they had to make enough money for the owner (who who might also be the Principal) to survive, yet there was usually more to the establishment of such schools than simple profit-making or earning a living. Tooley (2009) gives many examples where wishing to help the local community was as much a part of the motivation for starting a school as increasing personal income, and this is shown by the free or subsidized places that are sometimes given to orphans or families without any means to pay. He also describes the way that an initial plan to run a kindergarten gradually expands into a full primary school as parents encourage the owner to extend the age coverage year by year as their children get older. Owners respond not only because they see the chance to increase their income, but because they see a need in their local community that they feel they can meet. This same sort of mixture of motives was found by Srivastava (2007a, 2008a) in her study of low-fee private schools in Uttar Pradesh. The role of local philanthropy should not be excluded.

There has now been considerable research on low-fee private schools in the developing world, and the existence of these schools has become more recognized. However, even recent studies have shown that there is a need to systematically search the streets in some areas to locate schools: the administrative authorities simply do not have any records (e.g. Härmä (2016b) in rural Nigeria). There has been a particular concentration of research on India where many separate studies have been conducted. This includes work by Chudgar and Creed (2016), Härmä (2009, 2011), Kingdon (2007, 2008, 2020), Muralidharan and Kremer (2009), Shukla and Joshi (2008), Srivastava (2007 a,b), Tooley and Dixon (2006), Tooley (2007), and Tooley et al. (2007). But there has also been much work conducted in other developing countries such as Argentina (Moschetti and Snaider, 2019), Colombia (AlWindi (2015), Ghana (Akyeampong, 2009), Kenya (Edwards et al., 2017), Liberia (Dixon and Humble, 2019), Nepal (Bhatta, 2014), Nigeria (Umar, 2008; Rose and Adelabu, 2007), Malawi (Chimombo, 2009), Mozambique (Härmä, 2016a), Uganda (Kisira, 2008),

Pakistan (Fennell, 2013), and Peru (Balarin et al., 2019). Obviously, the details of low-fee private schooling differ according to the local context, but what is clear from all of these studies is the recent expansion of low-fee private schools and their growing importance to education, even in war-torn countries such as Liberia.

Factors leading to low-fee private schools

In 2008 Phillipson identified some of the most important factors leading to the expansion of low-fee private schools as: an over-supply of teachers, poor performance of the public sector, high hidden costs of government schooling and private tuition costs, and language of instruction. These factors still appear to be central. While each may not apply in all cases, most can be seen to be present in developing countries where an expansion of low-fee private schools is occurring.

Over-supply of teachers

Initially, it might seem strange that various developing countries have an over-supply of teachers. Yet, in countries such as India, teaching is seen as a well-paid and secure job which is also one that is “respectable” for women. Indeed, Kingdon (2020:16–18) shows in India government elementary schools teachers earn, on average, around 8 times the country’s per capita income. This ratio is very much higher than for teachers “in China, Pakistan, Indonesia, Bangladesh etc. where the ratio is typically between 1 and 2” (pp. 16–17). Over-supply is also a matter of definition, for in many countries private school teachers do not have to be qualified by the state. In many parts of India, the over-supply is not in terms of trained teachers, but of graduates who are deemed to be suitable to teach simply because they have a degree. In low-fee schools many teachers do not even have a degree or sometimes even any schooling after primary. In other parts, and in some other countries, there are many more trained teachers than places available due to poor planning and the desire of many to teach.

The oversupply of people qualified, or believing themselves qualified, to teach leads directly to new entrepreneurial schools being opened. It also means that new and existing low-fee private schools are able to employ teachers at very low cost, often at a fraction of the salaries that trained teachers can obtain in the government schools. Data on private school salaries is difficult to research for negotiations are often conducted at an individual level, and vary considerably by District and State. Kingdon (2020: 18) shows that the ratio of average private school compared to government school salaries seems to have declined over the last 20 years, partly due to the overnight almost doubling of state salaries in 2009, such that the worst ratio was found in the early 2010s in two districts of the Punjab where private school teachers were earning only 3% of that of Government teachers. Perhaps one-tenth is a reasonable guess overall – a figure which is still roughly equivalent to per capita income. Those teachers who are trained are prepared to tolerate these low salaries for a short period while adding to their experience of teaching and waiting for a job in a government school. Muralidharan and Kremer (2009), for example, estimate that (before the hike in government salaries) teachers in rural low-fee private schools in India earned at most one-fifth of the salaries of government school teachers. They were on average 10 years younger and twice as likely to come from the same village where the school is situated. They explained that, not only does this poorly paid teaching give them further teaching experience, it also gives them time for further study via distance education or local colleges so that they became better placed in the labor market for a future job in teaching or elsewhere.

Low salaries for teachers is the central reason why low-fee private schools are able to operate with low-fees. Härmä (2015) found that in Lagos the mean private school salary was only 60% of the legal minimum wage and only 42% of the starting salary for teachers in government schools. Even where extra funding is obtained from religious or philanthropic organizations, low-salaries are usually crucial in balancing the budget.

Overall poor performance of the public sector

The failure of the government sector can be simply that schools are not available for all children, or not within what the parents regard as a reasonable distance from their homes. This is the case in many rural parts of India, Nigeria, Uganda, and so on. It can also be that the schools available do not offer the type of schooling that parents desire, in particular with regard to religion or nature of the curriculum. Interestingly, this can apply as much in developed countries as in developing ones where schools for religious minorities such as Muslims or evangelical Christians are often not available and these groups feel forced to provide their own (often low-fee) private schools (Walford, 1991).

But the most significant way in which government schools are thought to have failed is in terms of academic success and factors linked to this. The reduced salaries paid to teachers in low-fee private schools allow them to employ proportionally more teachers than in government schools. In Muralidharan and Kremer’s (2009) study, for example, they found that the pupil-teacher ratio for the private schools of 19.2 was less than half the ratio of 43.4 in government schools. But, perhaps most importantly, teachers in private schools are often perceived as having a greater commitment to the school and to the pupils than teachers in government schools. This is seen in terms of the number of absences by teachers (which many studies have shown is often far lower in low-fee private schools, e.g. Härmä, 2015: 184), the amount of time spent teaching by teachers when they are present, and by the fact that teachers in low-fee are more likely to be local to the school and thus “understand” the children better, speak the local language, and be more accountable to parents. Private schools, of course, have a greater ability

to sack teachers who do not meet expectations than do far more bureaucratic, and unionized, government schools. In contrast, as we have seen, teachers in low-fee schools are less likely to be trained teachers and to have a lower level of education than those in government schools.

It has long been known that there are problems with many schooling systems in the developing world. For example, an important *Public Report on Basic Education* (The PROBE Team, 1999) in four northern Indian States, showed many problems associated with the quality of schooling. When researchers called unannounced on a large random sample of government schools only half were engaged in any teaching activity. In a third, the Principal was absent. Examples were given of teachers being drunk, sleeping on the job, getting children to do their domestic chores for them, and teachers keeping schools closed for weeks at a time. The report concluded that, generally, teaching activity in these government schools had been reduced to a minimum, in terms of both time and effort. More importantly, they claimed that “this pattern is not confined to a minority of irresponsible teachers – it has become a way of life in the profession.” Similar conclusions have been drawn by many research studies.

There is something of an irony in that, while there are such clear problems in the government sector, for many educationists it is the quality of the schooling provided in the private sector that is a key concern. But these are reasonable concerns given that the fees of such schools are low mainly because the teachers are not paid salaries anywhere near those of government school teachers, and teachers in these low-fee schools are often not trained or qualified teachers. It is important that parents are not being exploited and part of their very limited incomes being wasted. Yet, Tooley et al. (2007) found, in an extensive census and survey of private and government schools in the notified slums of Hyderabad, that on a variety of measures (including pupil-teacher ratio, teaching activity, teacher absenteeism, and classroom facilities) private unaided schools (including the unrecognized ones) were actually superior to the comparable government schools. In a later studies of academic performance in India, Nigeria and Ghana, Tooley and his colleagues (Tooley, 2009, ch 9) gave standardized tests to thousands of children and showed that the children in private schools in general scored higher on these tests in key curriculum areas than children in government schools. This was true even when the results were controlled for several background variables to try to account for the differences between the children’s backgrounds. Such studies are always open to criticism for not controlling for sufficient variables.

In the mid 2010s there were two major reviews of published studies on low-fee schools conducted by Day Ashley et al. (2014) and Wales et al. (2015). These reports drew together a great deal of data and are a useful guide to relevant publications, but are less useful for their overall findings. The basic problem is that any review, by its very nature, cannot take into consideration the social and historical contexts in which schools and education are embedded. Countries vary greatly in the regulatory and financial context in which both state and non-state schools function. To try to make generalizations about the nature and impact of non-state schools is fraught with problems – a fuller understanding can only be achieved a country at a time and, even then, there is considerable variation in the quality, nature, and effectiveness of individual low-fee private schools.

However, it is worth briefly examining some of the findings of these reports on academic advantage. Where there are nearby government schools, one of the most important questions that researchers have attempted to answer is whether low-fee private schools actually offer any academic advantage to children over that available in government schools. Day Ashley et al. (2014) examined research published in the previous five years focusing on 11 countries that had been prioritized by the UK Department for International Development – Bangladesh, Ghana, India, Jamaica, Kenya, Malawi, Nepal, Nigeria, Pakistan, South Africa, and Tanzania. This review considered private schools that were dependent on fees for all or part of their of their operational and development costs, and were owned and/or founded independently of the state. It did not include schools run by NGOs, charities, or religious organizations. Fifty-nine studies were judged to be of appropriate quality and included in the review. As such review studies are unable to take account of each country’s differing histories and contexts, while not including elite private schools, some of the research considered may include moderate-rather than low-fee schools. Overall, there was only one finding where they were able to present strong evidence – that teaching is better in private schools than in state schools as measured by levels of teacher presence and teaching activity as well as teaching approaches that are more likely to lead to improved learning outcomes. Simply stated, the teachers are more likely to turn up and teach their classes. The report found moderate evidence that parents perceived that private schools were of better quality than government schools in terms of teaching, teacher attendance, school performance, small class size and discipline. The study found moderate evidence that private school students actually achieved better learning outcomes, but found ambiguity about the size of the school effect and they noted that “many children may not be achieving basic competences even in private schools” (Day Ashley et al., 2014: 1). The report was heavily criticized by Tooley and Longfield (2014) and an active blog ran on the UKFIET website for a while (2015), with some of the criticism being accepted by the original authors of the report.

A more recent review by Akmal et al. (2019) examined 33 empirical papers published between 2014 and 2019 specifically looking at the relative academic success of children in government and low-fee private schools. Of 13 papers judged of appropriate quality, they found eight showing a positive effect on learning outcomes for private schools (including Rolleston and Moore (2018) on Andhra Pradesh and Alcott and Rose (2016) on Kenya and Uganda) and five studies showing no or very little difference between government and low-fee private schools (including Dixon et al. (2019) on Delhi, Zuilkowski et al. (2020) on Kenya). Akmal et al. (2019) found that the evidence had not changed since the original DFID Report, and gave only weak support for private schools advantage. A study by Gruijters, Adcott, and Rose (2020) of schools in India, Kenya, Pakistan and Uganda found that once they had controlled for family background, there were (at most) small private school learning advantages in all cases – ranging from 0.06 to 0.25 standard deviations. This is non-negligible, but it is from a very low baseline. One thing that is clear is that if low-fee private schools do give better outcomes than government schools, in practically all cases in the developing world the differences are small and the average level of achievement attained is low.

The second major review linked to that of (Day Ashley et al., 2014) but covering philanthropic and religiously-based schools (Wales et al., 2015) has had less impact, despite of the fact that this type of school plays a large part in provision in certain countries. BRAC, for example, has 32,000 schools mainly in Bangladesh, while madrasa schools play a large part in Pakistan and Bangladesh. In the Democratic Republic of Congo Catholic schools dominate this form of provision. A major problem is that there is limited high quality research on whether children are more academically successful in these schools than in government schools, but the review found moderate evidence that some philanthropic schools gave an academic advantage while limited evidence suggest that religious schools were similar to government schools.

In summary, while parents clearly believe that low-fee private schools are likely to produce academic results that are better than the corresponding local government schools, there are mixed research results on this. In some areas of some countries there is fairly strong overall positive support, but the differences are small, and the overall level of performance is low. In other areas of the same or different countries there is little or no evidence for their success. In the end, as in the wider private sector it depends on the quality of each individual private school and the quality of the competing government school. Härmä (2019) has shown in her case studies of Abuja, Accra and Kampala that regulation is weak for both types of school. In such a situation variation in the quality of individual schools will be high, such that broad generalizations and averages are only partially informative.

Hidden costs and private tuition costs

Even in most developing countries, at least primary schooling is nominally free. In practice, there are still costs to be met for school uniforms, books, stationary, “voluntary” gifts to teachers, and to the school for specific activities. But if government schools are not performing effectively, many parents also pay for supplementary private tutoring – sometimes given by the very same teachers who should have been teaching their children during the school day. The decision that parents make is not one of free schooling for their children versus paying fees for private schools, but one of how much more a low-fee school would cost.

Private supplementary tutoring has boomed during recent decades (Aslam and Atherton, 2014; Brehm and Silova, 2014; Bray et al., 2018). Mark Bray (2006, 2009) has documented some of this growth in a wide range of countries from Canada and France, to Cambodia, Bangladesh, Kenya and Egypt. Gathering together results from several surveys he shows, for example, that about two-thirds of Kenyan Grade 6 pupils, about a third of students from Bangladesh and Namibia receive supplementary tutoring. Many of these families using private tuition will be more affluent than those using the low-fee private schools but, if the child is attending a “free” government school, it might be cheaper to move the child to a private school that actually teaches well instead. Low-fee private schools can be seen to be partly in competition with what parents can obtain by employing private tutors. Indeed, as in some countries children in low-fee private schools are sometimes enrolled in government schools in addition to the low-fee school (to obtain free lunches or books, or to ensure that they can enter national examinations), the low-fee schools might be seen as a developed version of supplementary tuition.

Language of instruction

The last of Phillipson’s (2008) four factors that are liable to lead to a growth in low-fee private schools is the common demand among the world’s poor for a particular language of instruction. Sometimes it is minorities who wish their children to be taught in the language of the home rather than an official language but, in contrast, it may be that parents believe their child will have an advantage in life English is learned from a young age. English is seen as an international language that will provide access to future jobs. In Nepal, for example, many low-fee private schools advertise themselves as “English Boarding” or “EB” schools. In this case the word “boarding” has been transformed into a signifier of prestige, linguistically associating the schools with the major private boarding schools of Britain. The word “English” reinforces this high status and also indicates that the language of instruction is supposedly English for the main subjects. Whether or not this is correct is a matter of individual investigation. It is also highly debatable whether using English as the language of instruction at an early age actually helps children learn either English or the other subjects.

Access and affordability

An important area for research and debate has been whether low-fee schools are accessible and affordable for very poor families. There are many local studies particularly in rural areas which find that low-fee schools are both inaccessible and unaffordable (e.g. Härmä and Rose, 2012; Härmä, 2016a,b; Riep, 2014). The review by Day Ashley et al. (2014) found weak and inconclusive evidence about the accessibility of private schools for poor children. There were differences between urban and rural areas in the provision of private schools, and the spread varied in different countries with generally there being greater access in urban areas. There was inconsistent evidence about whether more boys than girls were attending private schools, with this being more common in India and Pakistan. In contrast, Wales et al. (2015) found strong evidence that philanthropic and NGO schools often purposefully located themselves to reach the poor and marginalized in rural areas and urban slums. They also often targeted girls.

The DFID Report (Day Ashley et al., 2014) also found moderate evidence on whether the poor are able to pay for private schools. Most was neutral, some negative and the report found no positive evidence that any but a few children from lower economic quintiles are able to pay the necessary fees. This was one of the areas strongly challenged by Tooley and Longfield (2014). The report by

Wales et al. (2015) identified questions of affordability as one of the significant gaps in research, yet many philanthropic and religious schools are targeted at the poor.

One of the problems with surveys of research relating to a wide range of different countries and circumstances is that they are likely to give weak evidence overall. One has to examine access and affordability of low-fee schools at a local level and within the historic, economic and social context of these low-fee schools within the spectrum of private schools and government schools available. It is obvious, for example, that urban areas are likely to have greater choice between private schools and that rural areas may only have one or no private schools that is possible for them to use. There is a spread of private schools in terms of geographical availability as well fee level.

Kingdon (2020) has used a variety of government data to examine the extent of private schooling in India, focusing on recognized and unrecognized unaided schools, while knowing that this may under-represent the number of unrecognized schools. First she charts the rapid increase in private schools and the corresponding decrease in government schools, which she describes as a “parental abandonment of government schools.” Next she uses data from a national household survey to find how much families pay in school fees. She presents both mean and median fees for States for both urban and rural families. She benchmarks these fees against various criteria and finds that, for example, median fees compared to annual minimum earnings of a daily-wage worker can be in one state as low as 4% and are about 10% overall. She also finds that, on average, about 26% of rural private pupils’ monthly fees are below their State’s daily minimum wage. She argues that in many States more than one-third of private schools are serving poor families. In other words, using these definitions, a good proportion of private schools are accessible to the poor.

This finding from Kingdon is in contrast to much of the literature, but an important paper by Tooley and Longfield (2016) examines the seeming conundrum that there is good evidenced that some of the very poorest in various nations are using low-fee schools yet various studies indicate that they are unaffordable to the poor. The problem is the very simple one that most researchers use average fees in their calculations and fail to consider that this means that very many schools charge less than the average. They are actually asking a question of “Can the poorest families afford the average fees that are paid by families who send their children to private schools?” But the appropriate question is whether there are schools available that the poorest can afford. Just as with the rest of the private sector, there is a range of prices even for those schools specifically aimed at the poor. Further, the additional costs such as for food, stationary, uniform, and transport are often treated as if they are fixed, yet the poorest will spend less than the average poor in each of these areas.

Even the stated fee in low-fee schools is more flexible than it may seem. Schools may advertise that there are reductions for second and subsequent children, but may also be prepared to offer lower fees in particular circumstances. In a similar way to major private schools around the world, some offer scholarships to able children because these children are likely to be successful in external examinations and become good advertisements for the school. Other schools may be genuinely philanthropic and allow lower fees to orphans or where families are having unexpected financial difficulties. While some schools may have owners who can choose to be personally philanthropic, other schools may be forced into philanthropy by the need to maintain student numbers. The incomes of many of the parents of children in low-fee schools are often erratic and unpredictable, which leads to similar problems for the schools (Rolleston and Adefeso-Olateju, 2014; Edwards et al., 2017). Srivastava (2008b: 454) reports “fee-bargaining” and “fee-jumping” as parents either bargain to reduce their payments or simply change schools leaving a debt. A child paying a smaller fee for tuition is better than a vacant place, so in some circumstances parents have negotiating power. We do not know the extent of such flexibility in fees actually collected but, even without any flexibility, in any discussion of affordability it needs to be remembered that a median has half below and half above that average value, and the very poorest will try to find a school in the bottom half.

This question of affordability is key to for those who believe that low-fee private schools have an important role in providing schooling for the poor (e.g. Dixon, 2013; Tooley, 2009), but the fact that there may always be some very poor families that cannot afford even the lowest fees does not mean that low-fee private schools cannot play a part in schooling the poor. Those low-fee private schools that are religious or philanthropic are usually designed to reach the poor.

Low-cost private school chains and international investment

While many of the early low-fee schools were provided by individual entrepreneurs who either wished simply to be employed or to make a profit, low-fee private schools soon became the target of investment. Between the first and second editions of James Tooley’s book on *The Global Education Industry* (1999, 2001: 13–14) a new introduction was written in which rather scathing comments on schools “charging very low fees, and offering education of variable quality” and “basic education with no frills” in the first edition had been regretted and new information added on the ubiquity of such schools in India with positive comments made about the schools and the “Federation of Private Schools’ Management” in Hyderabad. It is noteworthy that both books were so early, and that Tooley was beginning to think about brands of schools with might improve quality and management. By 2007 Tooley was suggesting that investors might help local entrepreneurs through loans to expand their schools into branded chains which would help parents make choices about the quality of schools. Alternatively, investors might establish joint ventures with local entrepreneurs to form their own school chains. Tooley (2007: 41) envisaged initial research and development involving technology, curriculum, pedagogy and teacher-training to generate a replicable model for education for the poor within a franchise model.

Since that time, and in part due to Tooley’s own involvement, in addition to being a way of enhancing Education for All and Global Development Goals, low-cost private schools (in his terminology) have become investment opportunities for some very

big players in the “education industry.” Ball (2012, ch. 3, 4) has traced Tooley’s involvement in various policy networks and his role as a policy entrepreneur at an international level urging investment in for-profit low-cost schools. In April 2007 he joined Orient Global, a Singaporean private investment company, as President of its newly created US\$100 million Education Fund. That fund has since given grants to several groups with which he previously conducted research: the Kenya Independent Schools Association, working in the slums of Nairobi, The Association of Formidable Schools in Nigeria, and Joy’s Schools in Zimbabwe. Organizations and chains of low-cost schools have many advantages over individual and isolated entrepreneurial schools. They enable the sharing of good management techniques and the development of curriculum ideas. They act as a brand name or assumed badge of quality. Franchised chains of schools go further and allow a centralized curriculum to be developed such that undereducated teachers can be trained to present standard lessons of a consistent quality. In Tooley’s (and other advocates’) view, low-cost schools provided through profit-making chains of schools can extend the reach and quality of basic education for the world’s poor.

Omega School Franchise is one such chain which was co-founded in 2008 by James Tooley and Ken Donkoh, a Ghanaian entrepreneur who had previously worked for Oxfam and USAID. The model is that of a “school in a box” which usually involves the construction of a 12-classroom building and all the initial materials and resources needed for 500 students. Each school is said to be immediately self-sustainable as parents pay on a “pay-as-you-learn” daily fee system. The Omega Schools Franchise was studied by Riep (2014) who, in 2013, was able to visit six Omega Schools and conduct interviews, observations and a survey of students. At that time the chain had grown to 20 schools with about 11,000 students and had more than 38 schools after four years. The initial growth was helped by an investment in the chain by Pearson Affordable Learning Fund established in 2012 by Pearson Education – the world’s largest multinational education corporation – with Michael Barber as its first Chairman. Growth seems to have slowed after this period and the chain was sold to the Rising Academy Network in 2020.

Riep’s (2014) interviews with Donkoh indicated that Pearson saw their involvement in low-cost schools as an extension of their global focus on education. There was huge wealth at the “bottom of the pyramid” (Pralhad, 2005) from which profit eventually could be made. Riep (2014: 266–271) describes the franchise in terms of the McDonaldization of education, where the emphasis is on efficiency, standardization of product, brand reliability, and consumerist pay-as-you-learn. He does not mean this to be a compliment, but as if the schools could actually offer these, it would be better than many other schools in most developing countries. The problem is price. While the price is low because the schools employ mainly untrained people to teach and then train them to follow set lesson plans and curriculum, it is not low enough for the very poor. Riep (2014: 272) shows that the lowest 7% of Ghana’s Central region would have to pay, on average, 43% of their family income to pay for one child, and even someone earning the average income for Ghana would have to pay 40% of income. While these are low-fee schools in comparison with other local private schools, they are not low for many families. Further, he found that in a survey of 437 students in four schools only one had not been in another school before, including other private schools, thus the schools are not providing new places.

It is worth noting that the idea of low-fee private schools employing non-trained people as teachers and then teaching them to follow a pre-set curriculum is far from new. Accelerated Christian Education (a US profit-making corporation) designed such a curriculum and teaching program in the 1970s, and there were some 5000 US ACE schools in the 1980s (Rose, 1988; Walford, 1991; Scaramanga and Reiss, 2017), with a further 800 elsewhere including the UK. In 2020 there were around 7000 ACE schools worldwide including schools in USA, England, Rumania, and Ethiopia. In 2020 fees at the Vine Christian School, Reading, UK were under £2000 per year for senior students. This is low compared with the vast majority of private schools in the UK, including the roughly £3000 charged at the Independent Grammar School, Durham, UK, which advertises as “Independent, affordable education” and of which James Tooley is Chair of the School Board and a primary investor (but which does not use a pre-packaged curriculum). This school is intended to be the first of a chain of “affordable” schools in the UK. However, with median earnings for full-time employees in the UK being just over £30,000 per year in 2019, the question of affordability for which groups is once again raised. Even Tooley (2018: 15) himself admits that families in the lowest quartile will not be able to afford the school, and to pay for two children will mean the family has to be in the middle quartile for discretionary income. Forgetting his warning about using averages (discussed above), he claims that this compares well with the average private school where only the top quartile can afford to send even one child. His use of the term “low-cost” has become very flexible.

The last decade has seen a remarkable growth in chains of private schools supported by business as an investment, by philanthropy, and through various Public-Private Partnerships. From being an educational sideline, low-fee private schools and private schools in general have moved center-stage in ideas about the provision of school places in the less developed world. The World Bank, various governments’ aid agencies, policy agencies, investment organizations, and others now see supporting private schools as a positive activity (Verger et al., 2018). Such chains as Bridge International Academies were first funded by Deutsche Bank America’s Foundation, Gray Ghost Ventures, and the Kellogg Foundation through the Clinton Global Initiative, then had further investment from the Omidyar Network (Santori et al., 2006). Low-fee private schools have become seen as a strategy for achieving Sustainable Development Goals in education by governments, the aid industry, and big business as they are seen as offering more efficient access to education with less government spending. What used to be the UK’s Department for International Development DFID was one of the most active in promoting the expansion of low-fee private schools in countries such as Kenya, Nigeria and Pakistan and have been widely criticized for such support (Junemann et al., 2016; Verger et al., 2018). One interesting aspect of this is the blurring of the boundaries between low-fee and other private schools. The International Finance Corporation, the International and Private Education Forum, the Qatar Foundation’s World Innovation Summit for Education, and others organizes regular international conferences on private education where investors, consultants, aid agencies, and education entrepreneurs are brought together, and low-fee private schools are simply seen as part of the continuum of schools in which investment might be made.

Srivastava (2016) sees this as the Second-Wave of low-fee private schools and as a part of a broader trend of privatization in education, and is cautious about the extent of activity reported and whether the chains are actually affordable by the poor. She also questions the involvement of governments with PPP schemes which have caused considerable costs even in developed countries. Indeed, low-fee private schools now seem to be being treated as an extension to the existing spectrum of private schools rather than something distinctly different. For example, in a very unusual and government legislated PPP, the 1999 Right to Education Act for India demanded that all private schools – from the most elite private schools to the poorest of the low-fee – offer 25% of their places free to children of specific poor groups with only minimum funding from the state. Theoretically the Act also introduced tougher criteria for the recognition of all private schools so that minimum standards were achieved, but what is unusual is the incorporation of the entire private sector within this policy.

Conclusion

We have seen that there is no clear definition of low-fee private schools, and no clear dividing line between these so-called low-fee schools and other private schools in each country. While there are cases in academic discussion where the research questions make it helpful to draw an arbitrary line between these schools and other slightly more expensive private schools, families are unlikely to be doing so. They will be looking for a school that they can afford and seems to meet their needs. These schools are best understood and analyzed as a part of the spectrum of private schools within each country providing for a range of incomes. As with other private schools, generalizations across countries and even within countries are often misleading. Again parents will not be concerned with averages, but with comparisons between their local government and private schools bearing in mind how much they are willing and able to pay and what each school offers.

The belief that there was huge wealth at the “bottom of the pyramid” (Prahalad, 2005) from which profit eventually could be made has driven some of the boom in private schools. However, it is often forgotten that Prahalad did not include education in his study and, even though the sub-heading of his book is “Eradicating poverty through profits” the two of twelve extended examples that are nearest to education are on eye care and prosthetic feet for the poor. Both of these examples are actually non-profit organizations, and several of the other examples rely on some elements of philanthropic activity. In fact most of the examples could equally be non-profit and do not depend on the profit motive, just cheaper and more efficient ways of doing things, which could be run by non-profit just as well as for-profit organizations.

There is a variety of reasons why low-fee private schools have been established in developing countries, but the main reason is failure of the government to provide enough schools or schools of an acceptable quality or nature. Emphasizing the profit-making of entrepreneurs as a solution to the problem of inadequate schools leads to particular proposals, such as aiming to support and extend such provision. Brands of low-fee schools may provide schools of a more consistent quality, but we have seen that such chains of schools do not necessarily serve the poorest, and within the private sector as a whole there has been a tendency to try to move up the income and fee scales, thus gradually excluding the poorest families. This is less true with religious and philanthropic schools which have a clear mission.

The fundamental problem of private schooling applies to low-fee private schools as much as to any other private schools (Walford, 1990). Those parents who are able and willing to afford a private school, because they believe it will give advantages to their children, are taken out of the government educational system. These are the very parents who are most likely to be able and willing to challenge politicians to improve the government system. Politically this can be disastrous for the needs of the poor and voiceless as governments respond to pressure.

Treating the phenomenon of low-fee private schools as separate from the rest of the private sector, and from the government sector, limits our understanding of how these schools have been established and how they fit within their local educational systems. There is now a globalized desire among poor parents to have their children attend school (Walford, 2015). Families have put their faith and dreams in schools as a way out of poverty for their children. There is a great deal of evidence that parents would prefer the government to provide such schools free at the point of delivery, thus sharing the costs of educating all young people between the whole population – few would pay fees if good schools were provided.

Introduction

Economic inequality between high-income and low-income countries is so pronounced that one estimate suggests that for every \$1 given in aid, \$24 is extracted in terms of resources, patents, trade deals and money manipulations (Kar and Schjelderup, 2016). Within countries too, inequalities between rich and poor, dominate daily life. Inequality, driven by the movement of global capital (but not the movement of peoples), distorts life and expectations for billions of people (Deaton, 2013; Milanovic, 2016; Piketty, 2020; Stiglitz, 2011; Hickel 2020; Woodhead et al., 2009; and many others). At a time when millions are dying of Covid, very wealthy billionaires, like Jeff Bezos, Richard Branson and Elon Musk, oblivious to the needs of their fellow citizens, are spending billions on personal space travel (Nolan, 2021). Social mobility for most people is a fantasy, such are the structural inequalities that shape lives.

Yet the myth of social mobility continues to be powerful, and is embedded in the rhetoric of education. It may be true that for a very few, educational opportunities are fruitful and offer a route out of poverty, but very generally education systems tend to perpetuate inequality and confirm poor children in their poverty and in their position at the bottom of a hierarchy rather than offering them a way out. Literacy and numeracy are highly valued in modern societies, and it is undoubtedly better for survival to have some schooling rather than none, but state education systems are rarely redistributive. The elite almost always choose private, segregated education if it is available to them (Reay, 2017).

Early child development

Nowhere is this myth of social mobility more pervasive than in the education of very young children. This is partly due to the work of James Heckman, who won a Nobel prize for his work on econometrics, and his exploration of the predictive power of statistics to inform social policies. Heckman argued that early intervention programs provide higher rates of return compared to remediation programs targeted at older children and young adults. It is more economically efficient to provide early education and care to young children than for any other age group, in terms of long-term outcomes-higher wage earners, less call on social services and support. It is cheaper in the long term to provide education/stimulation for young children than to deal with results of no or poor education.

This conclusion about the relevance of early intervention has been reinforced expanded by various international bodies, who have linked it to work on neuroscience. The argument put forward is that the brain grows most rapidly in the first three years; neurones expand and form dense networks, but in order to do this, the brain needs both adequate mental stimulation and adequate nutrition. The relationship between neurone growth and “stimulation” is tenuous (Penn, 2019a,b). The evidence on the importance of nutrients for growth, including brain growth, is stronger, but the World Food Program estimates that billions of children are hungry. Food poverty is very widespread, and getting worse. Programmes which dish out nutritional supplements to very young children do so in a context where elder children and adults often go hungry, and the nutrients may have to be distributed in such a way that no other family members can access them! Whatever the practical and cultural drawbacks in running programmes for very young children, they are seen to offer a magic solution to global problems.

What is one of the best ways a country can boost shared prosperity, promote inclusive economic growth, expand equitable opportunity, and end extreme poverty? The answer is simple: Invest in early childhood development. Investing in early childhood development is good for everyone – governments, businesses, communities, parents and caregivers, and most of all, babies and young children. It is also the right thing to do, helping every child realize the right to survive and thrive. And investing in ECD is cost effective: For every \$1 spent on early childhood development interventions, the return on investment can be as high as \$13. Early childhood development is also key to upholding the right of every child to survive and thrive.

(WHO's Nurturing Care foreword 2017).

Healthy development in the early years (particularly birth to three) provides the building blocks for educational achievement, economic productivity, responsible citizenship, lifelong health, strong communities, and successful parenting of the next generation. What can we do during this incredibly important period to ensure that children have a strong foundation for future development?

(Harvard Center for the Developing Child, 2020).

International aid programmes, especially those, like the Children's Investment Foundation Fund (one of the biggest donors-who also benefit from tax breaks through charitable giving) have latched onto it as an opportunity to entrepreneurially engage in an area previously neglected in international aid portfolios, and which appears to promise good investment returns. The approach to early childhood generated by Heckman is referenced by almost every international organization – including major bi-lateral agencies like the World Bank, UNICEF, UNESCO and WHO— as well as by almost all leading child charities and think tanks. It has become an international development commonplace. Many policy documents, as evidenced above, argue that early interventions in childhood, through providing high quality early education for targeted populations, can be an effective strategy to reduce the prevalence of later adult 'problems' such as poverty, unemployment, criminal offending and intergenerational disadvantage.

WHO in particular has promoted an early intervention approach which targets parents (inevitably mothers) by using home visiting programmes. Using tenuous arguments about brain development to bolster their interpretation of the Heckman data (Penn, 2019a,b) they argue that the first 1000 days are the most important for laying down the foundations of later life. WHO claims that interventions which enable parents and children to learn more about optimal child development strategies, will improve children's brains and thereby their life-chances in an economically efficient way and save money on subsequent remedial services, as Heckman predicted. There are many claims for these home visiting programmes. One of the most cited is a Jamaican program which claims that long-term home-visiting interventions produce higher income earners over a lifespan (World Bank, 2021). The program, targeted at 170 children in a total population of 2.3 million inhabitants has in no way impacted on Jamaica's considerable wealth inequalities, nor has it altered its wealth as a nation vis a vis other countries. Yet these programmes are touted as a long-term opportunity to substantially improve children's future, and in doing so, make countries more prosperous and better able to compete in the world market. This is such a staggering and preposterous claim for so small an impact, that one wonders what is at stake.

Heckman's work draws on an underlying theory of skills formation. Key to this theory is an assumption that directly rejects the impact of structural inequality:

disadvantaged families do not invest sufficiently in their children because of information problems rather than limited economic resources or capital constraints.

(Heckman et al., 2013).

This approach focuses on individual success in world of inequalities. It focuses on what contributes to individual success and takes the unevenness of the world, and the reluctance to pay for state services other than for a needy minority, for granted. It seeks only to justify small interventions which may make some children able to cope better than they would otherwise have done, at a relatively small cost.

This research is invariably couched in hyper-rigorous statistical terms, which excludes any wider conceptual discussion outside of the statistical formulas employed. Its frame of reference is explicitly narrow and it deliberately does not take structural inequality into account. This is increasingly problematic, since Heckman's original data, on which he constructed his predictive statistical curve, was drawn from a small pool of USA studies which only use randomized controlled trials, some of which were initiated over 50 years ago and date back to the 1960's and 1970's. The initial assumptions and procedures of those studies, especially those concerning race, do not bear re-examination. Although Heckman has since been involved in longitudinal studies in a number of countries, including Jamaica and Italy, the highly contextual nature of the assumptions, and the limitations on its generalization to other countries, is rarely conceded (Rea and Burton, 2020)

One of the underlying assumptions in the WHO approach is that child development tenets, like medical knowledge, are scientifically based and universal (Phillips et al., 2017). Just as poor nutrition in early childhood leads to stunted bodies, poor stimulation in early childhood leads to stunted brains. Leaving aside the strength or otherwise of the neuroscientific and brain growth arguments, what is "poor stimulation"? Robert Serpell, who has long convened a group of African psychologists, argues that ideas about child development are predominantly and explicitly Westernized and Americanized, heavily emphasizing individualism, cognitive and linguistic precocity and personal striving at the expense of – for example in Africa - of co-operation and deferential helpfulness. Many other psychologists and anthropologists have commented on the cultural biases of typical child development texts from the global North (Burman, 2018; LeVine and New, 2008; Gottlieb, 2004). Tobin et al. (2011) gives a bleak description of the "shopping mall" mentality encouraged by American caregivers of young children, continually urging them to "choose" between a limitless range of commercial goods, and enabling them to vigorously defend and argue for their choices even when they inconvenience others. Perhaps the most trenchant comment is that of Jerome Brunauer. *"Perhaps even more than with most cultural matters, childrearing practices and beliefs reflect local conceptions of how the world is and how the child should be readied for living it."*

Many of those concerned with promoting "child development" are often singularly uninterested in how parents view the world, and what, as parents, they consider children should be learning. The statistical methods used in randomized controlled trials deliberately exclude qualitative data, and there is no account in any of the Jamaican material for example, of how mothers view the

program. Their views are an irrelevance in calculating efficacy. The home visiting programmes also assumes the availability of mothers, and ignore any paid work in which they may be engaged, an assumption which UN women (2017), for example, has severely criticized.

It is partly that -relatively speaking - early child interventions are such a cheap option for improving the world, and do not disturb the status quo, that makes it such a popular idea among international policy makers. Teaching mothers to look after their children better, is a typical Westernized welfare solution that neatly puts the burden and the blame for poverty on mothers themselves, or at the very least, refuses to take other explanations into account. The poor can be taught how to do their job of child-rearing better. From a historical perspective, it is what the blinkered rich have been saying to poor mothers for centuries, it's your fault, not ours, that you are poor, and you should improve yourself and do more for your children and feed them properly (Cunningham, 2020). As in earlier times, there is a high moral tone to the advice. A series of articles in the Lancet on the topic of *Nurturing Care- Promoting Early Child Development*, suggests the lives of millions of children could be saved. *New estimates, based on proxy measures of stunting and poverty, indicate that 250 million children (43%) younger than 5 years in low-income and middle-income countries are at risk of not reaching their developmental potential. There is therefore an urgent need to increase multisectoral coverage of quality programming that incorporates health, nutrition, security and safety, responsive caregiving, and early learning. Equitable early childhood policies and programmes are crucial for meeting Sustainable Development Goals, and for children to develop the intellectual skills, creativity, and well-being required to become healthy and productive adults* (Black et al., 2017).

Reducing human suffering is a wholly admirable goal, but home-visiting programmes for children under two, driven by a statistically sound but extraordinarily narrow econometric theory, is likely to be no more than a distraction and an excuse for wider inaction, given the geo-politics of inequality. The logical conclusion of this reasoning is that if an estimated 43% of a population has stunted bodies and stunted brains, their contribution to international debate cannot be taken too seriously, and those from high-income countries who are seeking to redress the situation are the best informed to know what to do, and likely to remain so.

Early education

Another variant of early intervention is that promoted by UNICEF and other agencies, and incorporated into the Sustainable Development Goals. Target 4.2 is by 2030 ensure that all girls and boys have access to quality early childhood development, care and pre-primary education so that they are ready for primary education. Drawing on the same Heckman data, but applying it in a different context, the assumption is that pre-school experiences will enable better performance at school, although very often the caveat "high-quality" is attached. But more often than not, pre-school, even less than mainstream school, is not of high quality, but provided by a plethora of private operators, many of them of poor quality. Pre-school programmes have been monitored for "learning outcomes" and there are various, mainly North American schedules to monitor the quality of these interventions. But often the same problems arise, the lack of competent, trained caregivers in the private sector - even in countries like the UK (Christie and Co, 2019). Ex-communist countries, which have a history of early childhood education and care tend to have more rigid provision, but the standards also tend to be higher in terms of infrastructure and training (Penn, 2019a,b).

As well as incorporating very particular, Westernized, views of child development, and about what constitutes a high quality early education, many of the lobbyists for early intervention also hold traditional views about the organization of family life. Mamdani (2017), in a famous study, used court records, to show how patriarchal colonial assumptions in Kenya have shaped the law, so that ownership of land was invariably registered with male heads of households, rather than as traditional dual or female ownership. This colonial process of diminishing the rights of women and transfer of ownership of rural land has in the long-term had disastrous consequences for women, and contributed to the migration of women from rural to urban or peri-urban areas. Razavi (2011) has shown that the phenomenon of female single-headed households in poor urban areas has become a norm, throughout the world, exacerbated by both the legacy of patriarchal colonial policies and by current fiscal policies. Women in these urban and peri-urban circumstances mostly work in the informal sector, as market traders, domestic servants, or in the sex industry. Poor women tend to work for long hours in precarious and largely undocumented jobs. As a result, there is a major childcare problem. Millions of very young children are often left unattended or in the care of barely older siblings (Sammans et al., 2016). In the cities of subSaharan Africa, unlicensed private entrepreneurs have profited from childcare enterprises, cramming very young children into unsuitable premises with minimum supervision, while their mothers are at work (Hughes et al., 2021).

This contradiction, between a prosperous, idealized family life, and everyday reality in low-income countries, is at last beginning to percolate through to international agencies. The World Bank, following on from a recent report by UN Women, has now emphasized the importance of gender issues, and suggests childcare, rather than other forms of early childhood interventions, should be a public priority for all countries. This has long been a position held by the OECD, whose documents on the issue date back to 1972. In 2006 OECD published a landmark document, *Starting Strong II* in 2006 and continues to follow this up with annual figures on its Family database, and updated versions of *Starting Strong*. Similarly, the EU has made childcare and education an integral plank in its education services, publishing a series of reports and analyses in its Eurydice program (Eurydice 2019). OECD/EU recognize that to provide comprehensive ECEC services requires substantial investment and competent governance rather than fragmented private initiatives, and also publish figures on the level of this investment and its administration across member states.

The World Bank *Better Jobs and Brighter Futures* document on childcare (Dervicelli and Beaton-Day 2020) is rather late on the scene, and still very much USA focused in its examples. It outlines some of the key regulatory areas for childcare, according to criteria enumerated by (mainly) American psychologists and educationalists, as noted above. The quality of a childcare or ECE program

depends on several different elements, which are usually categorized as either “structural” or “process”. Structural quality, typically the easiest aspect of quality to be defined, measured, and regulated, includes staff/child ratio, group size, and physical infrastructure. Process quality includes the program or curriculum; the workforce; the interactions that take place between adults and children; and the wider system which ensures these aspects of quality are in place. All five categories should be considered as part of an integrated approach, with each category supporting the others. However, the document is much vaguer as regards financing these initiatives. Educating and caring for young children is labor intensive, and requires a relatively safe and an environment which protects against hazards. The 2006 OECD document suggests 1% GDP as a target for funding an integrated childcare and early education system, and some few countries have achieved this target. But currently, in the World Bank literature, the assumption is that funding services can be achieved by a mixture of private enterprise, workplace nurseries (surely a fantasy in an informal economy), co-operatives, donations, and a very little state aid in the form of training and regulatory activities. The usual way of describing this unsatisfactory and tenuous mixture of financial incentives in which no organization carries ultimate responsibility is “a partnership”.

So although there is more recent recognition of the needs of women and children for childcare alongside education in low-income countries and elsewhere, the question of what it might cost and how it might be delivered, and to whom, is left largely unaddressed and undocumented.

Conclusion

This chapter has focused on the efforts of international agencies to improve the educational chances of young children in low-income countries. There are of course dialogs within countries and among groups within countries about education and what sustains it, which may or may not correspond to Western ideas. But many international agencies, heavily, if not totally influenced by Western ideas, argue that investment in early childhood education and care can bring about transformational change, in the lives of young children and in the prospects for the countries they live in. This article has argued that poverty and inequality are so entrenched and ignored, and the actions of international agencies, although indubitably well-meaning, are so clouded by a Westernized interpretation of childhood, that attempts to improve the situation are unlikely to succeed. It is unlikely that the education of millions of young children will be improved by current efforts of international agencies. But the illusion of success deters any substantial effort to get to grips with the problems that really exist.

Introduction

In the years 1987–1992 I was a professor at the University of Dar es Salaam in Tanzania. The meeting with students and colleagues there developed my interest in the language issue in Africa, which later became the main focus of my research (Brock-Utne, 2000, 2012, 2014, 2021; Brock-Utne and Skattum, 2009). When I first came to Tanzania I knew little about the country. I got hold of some books about Tanzania. I read in several of them that there were 120 languages spoken in the country. I asked people in the NORAD office in Dar es Salaam if they had learnt to speak the national language, Kiswahili. They answered that they had learnt some greetings. That was really all that was needed because the people they had meetings with and negotiated with all spoke English well. “And you will be teaching in English and all of the meetings you attend will be in English”, they said to me. “And besides” they said, “your colleagues will come from all over the country and will speak very different languages. It is only a waste of time to try to become a fluent Kiswahili speaker, but knowing some greetings may be useful.”

The first day I came to the Department of Education, there was a tea—break and all my prospective colleagues sat in chairs in a quadrangle, sipping very sweet tea. They greeted me in English but very quickly switched to speaking Kiswahili with each other. I said: “I had heard that you would be speaking different Tanzanian languages. Don’t you all come from different parts of the country?”. They answered that they did. They could speak many different local languages, but they all also could speak Kiswahili as a lingua franca, a language that united them. I decided already then that I would learn the language, so that the people sitting next to me in the tea break would not need to switch into English. When I started working full-time at the university and met my master students, I noticed that they all came into the class-room talking with each other in Kiswahili.

Teaching undergraduate classes with several hundred students was a great challenge. To make the classes a bit more interactive, I just lectured for about a quarter of an hour and then wrote some questions on the blackboard, which I asked the students to discuss in small groups for about a quarter of an hour. I had written the questions in English. Already the first time I did this, I started wandering in the auditorium, listening to the group discussions. I soon noticed that the students had quickly translated the questions. They all discussed them in Kiswahili. The discussions were lively (Brock-Utne, 2000/2008).

I shared office with my only female colleague at the time. We both had students coming to us for tutorials. I noticed that she gave several of her tutorials in Kiswahili or she code-switched from English to Kiswahili and back. I discussed this practice with her. She said that she was not supposed to give tutorials in Kiswahili, but she communicated much better with the students in that language than in English, a foreign language to them all. I told her that I was now bent on learning Kiswahili and she volunteered to help me. She taught me several proverbs and we built an ever-lasting friendship, doing research together and living together in the same room while conducting our research. As part of my duties as a professor of education at the UDSM I was also required to participate for 6 weeks each year in teacher practice supervision. This meant listening to our education students teach in secondary school, evaluate them and help them improve their teaching practice. I very quickly discovered the great difference in activity level among the

secondary school students depending on the language of instruction used. I noticed the lively atmosphere in the classes taught in Kiswahili (at that time not only the subject Kiswahili but also the subject *siasa*¹ was taught in Kiswahili) and the passivity of the students and aggressiveness of the teachers when the teaching was conducted in English.

The LOITASA project

The abbreviation LOITASA stands for Language of Instruction in Tanzania and South Africa. This was a research project which started in 2001 and lasted officially for ten years but in reality at least five more years. The last student who took her doctorate under the project did so in 2016 (Bakahwemama, 2016). In my years at the UDSM I had, through my yearly teaching practice supervision, experienced the problems students in secondary education had mastering the foreign language, English, when it was used as a language of instruction. I liked initiating discussions on the language of instruction issue with my colleagues. These discussions could become quite heated. Many colleagues thought, like I did, that it would be best for Tanzanian secondary school students to switch to Kiswahili as the language of Instruction (LOI). This was the language they normally communicated in, and were familiar with. It was the language of instruction for all of the seven years of primary school. Others claimed that this was impossible to do because English was such an important language; it was the language of science and technology. It was an international language.

One of my colleagues, Dr. Sulema Sumra, and I discussed the need for a research project on the language of instruction in Tanzania. I promised to look for funding for such a project.

There was at the time a board between universities in Norway, NUFU,² that could, on application, give money to Norwegian universities that would cooperate with and build capacity at universities in the South. NUFU preferred South-South-North cooperation. The Dean of the Faculty of Education at the University of Western Cape at the time, Prof. Harold Herman (2008:10) writes:

In 1999, Prof. Birgit Brock-Utne and I met during a Comparative and International Education Society (CIES) conference in the USA to consider the possibility of a North-South cooperation on language of instruction policies in Africa. In our ensuing years of dialogue and presentations at international conferences it was clear to me that Birgit, although Norwegian, was *an African scholar at heart*, a person with a flair and commitment to confront the multiple dilemmas facing the African continent. She had discussed the possibility of launching a research project on the language of instruction in Tanzania with colleagues at the University of Dar es Salaam. Together, Birgit and I, conceptualized a language in education project between the University of Dar-es-Salaam, the University of Oslo and the University of the Western Cape.

Later in the same year, I, gave a key-note address at the Oxford Conference (Brock-Utne, 2001a). It was called “Education for All - in whose language?” There I met Zubeida Desai from the language department at the University of Western Cape, who also presented a paper on the language issue in Africa - exemplified by the situation in the Western Cape. The two of us continued the discussion that had started between Harold Herman and me about a research cooperation around the Language of Instruction in Tanzania and South Africa. Zubeida and I decided that I should apply to NUFU for seed money to plan a project with partners from UDSM and UWC as part of a research project. The research project involved both a policy analysis and an experimental phase in both countries. In Tanzania, where the language of instruction shifts to English in Form I in secondary school, we decided that we would let some classes in Form I be taught science and geography in Kiswahili (we translated both the learning material and the tests into Kiswahili) for some months and compare the students with students taught in English only. In South Africa we looked into the situation for black isiXhosa speaking children living in a non-formal settlement near the airport of Cape Town. Both the teachers, the parents and the children spoke isiXhosa. That was the language of instruction only for the first three years. Then the language of instruction was supposed to switch into English, a language foreign to them all, a language they never communicated in outside of school. Here our intervention happened in grade 4 and 5. We translated learning material into isiXhosa. In both countries we found that children learnt much better when they were taught in a familiar language. Both in South Africa (Holmarsdottir, 2005; Nomlomo, 2007) and in Tanzania (Mwinsheikhe, 2007; Vuzo, 2007) the students said they learnt better and they also got better grades when concepts were explained to them in Kiswahili in Tanzania, and in isiXhosa in the informal settlement in the Western Cape in South Africa, languages they were familiar with.

Two of my Ph.D. students (Mwinsheikhe, 2007; Vuzo, 2007) and I (Brock-Utne, 2007) noticed that when the teachers were teaching in English, they frequently punished the students, mostly by having them stand all through the lesson. They never punished the students when the teaching was in Kiswahili. The teachers themselves were not aware of this fact, before we pointed it out for them.

¹«siasa» - a social science subject closely connected to the ideology of CCM—Nyerere’s party—was taught in Kiswahili all through the secondary school from 1969 to 1992 when the subject—under the influence of the reintroduction of a multiparty system—was renamed “civics” for the first 4 years and “general studies” for the next 2 years and taught in English (Mkwizu, 2002).

²In Norwegian: Norsk utvalg for Utviklingsrelatert Forskning og Utvikling (NUFU). Though it was started in 1991, it really took off only from 1996. The Fund, which originally came from NORAD, was administered by academics interested in developing countries from all of the universities in Norway (see Brock-Utne, 2019). It was located at the University of Bergen.

The introduction of private primary schools

It was important for the educator and President of Tanzania, Julius Nyerere, to create a good primary school for all children. In the policy directive, called "Education for Self-Reliance" Nyerere (1967) notes that for the education which independent Tanzania wants to build, "the purpose is not to provide an inferior education to that given at present. The purpose is to provide a different education" (p. 63). He wanted the educational system of Tanzania to emphasize co-operative endeavor, not individual advancement, and to stress concepts of equality and responsibility (p. 52).

In my book "Whose Education for All? The Recolonization of the African Mind" (Brock-Utne, 2000/2008) I show how imported assessment systems from the West along with the destruction of indigenous publishing and curriculum development have strengthened the neo-liberal policies outlined by the World Bank and have undermined the policies professed by a newly independent Tanzania. Nyerere saw it as important to have Kiswahili be the language of instruction all through the seven years of schooling. He was much against opening up for private schooling. He saw such a strategy as one which would undermine the equal society he wanted to create.

In an analysis of the formulation of educational policies in Tanzania in the nineties, the Danish researcher Buchert (1997a) found that the Tanzania Social Sector Review was worked out by the Bank (World Bank, 1995). When it comes to the "Education and Training Policy" (URT, 1995) paper, Buchert (1997a:52) reports that many of the government officials as well as bilateral aid agencies and people from the academic environment saw "a determined World Bank hand behind it." One of Buchert's interviewees said: "It has been stuffed down the throat of the Government by the IMF and the World Bank" (Buchert, 1997a: 52). Buchert mentions that during 1994 and 1995 the World Bank held a number of education seminars in Washington DC on Educational Policies in Africa and the Coordination of Aid. The seminars were held for key Tanzanian educators and had both a direct and an indirect impact on government thinking on education.

Work on the Education and Training Policy started in February 1993. According to Buchert (1997b) it was initiated due both to an internally felt need for an official policy that reflected the state of the art of education in the 1990s and to agency pressure for a policy framework to guide education assistance. The point of departure for the policy paper was the task force report The Tanzania Education System for the 21st Century—completed in 1992 and published in 1993 (URT, 1993). The Report analyzes educational needs in light of a future Tanzanian society able to cope in an increasingly globalized world. The Education and Training Policy (URT, 1995) opened up for private primary schooling. The language of instruction in these private primary schools is English. The private schools have mushroomed since the government opened up for them. Parents pay part of the costs of these schools. In the best schools parents have to pay very high school-fees, in the not so good schools parents pay less. The language of instruction also in these low-paying schools is still English or rather; bad and broken English. Parents send their children to private schools not so much because the language of instruction is English, but more often because these schools are better resourced. The pupils there have textbooks, there are fewer pupils in class, the teachers get their skills up-dated through in-service courses, are better paid and are not so often absent.

Strengthening of a government primary school

In the second phase—the last 5 years—of the LOITASA project the Tanzanian group decided to strengthen a government Kiswahili speaking primary school with textbooks for all the pupils in grade 6 and 7 and give the teachers in-service teacher training through two up-dating seminars. We gave this government school the fictitious name "Mweshipandeka". These two small interventions were enough to make the pupils in Mweshipandeka get better grades and be happier at school than the pupils in the English speaking private primary school with the highest school fees in the district. The teachers at Mweshipandeka were convinced that the better scores their pupils got had to do not only with the fact that they were provided with textbooks but also with the fact that they understood what the teacher was saying. They were taught in a familiar language (Bakahwemama, 2009, 2010).

But in the village where the experiment took place we heard several people say to each other, "Have you heard that Mweshipandeka" has become English medium?" The school had continued teaching in Kiswahili, but the village people thought that the fact that the school did so well, even better than the fee-paying private schools, meant that the school had switched to using English as the language of instruction. Nothing could be further from the truth.

The rhetoric of English and development

The growing craze for English all over the world is associated with the rhetoric of English and development, permeating into popular perception of the significance of English, often without any critical scrutiny. Broadly, English is projected as a global language (Graddol, 2000) or a language needed for maintaining a competitive edge in a globalized world. Yet, as Coleman (2011:104) notes:

Globalisation and competitiveness are associated with a need for English and then with a need to use English as a medium of instruction, although the logical relationships between these concepts remain unclear.

There is actually no logical relationship. The best way for a pupil living in a non-English speaking country to learn English is not have it as a language of instruction, but rather learn it as a subject, as a foreign language from teachers who are good at teaching foreign languages. Many parents are not aware of this fact.

The situation in India

Mohanty (2017) drawing on his work in respect of English in Indian society and education, discusses the processes through which English in India gets situated in a position of dominance, disadvantaging the other language communities. He analyses the role of English in Indian education in perpetuating social discrimination. He shows that while some groups benefit from English, most do not (Mohanty, 2017:266).

The first Prime Minister of India, Jawaharlal Nehru, was very concerned about the language question in India. He saw that the choice of English as the language of instruction created a class society. As leader of the socialist part of the Indian Congress party he had fought against the caste system of India. He saw that a new caste was being developed: an English speaking caste, separated from the rest of the people. Only 5% of the Indian population are fluent in oral and written English.

Mohanty (2017:275) notes that even though Prime Minister Nehru feared a development of an “English knowing caste” in India, he was not able to stop this development. In the struggle for Indian independence Mahatma Gandhi warned that English represented cultural alienation. Prime Minister Nehru (educated at Cambridge University and imprisoned by the British before independence) expressed in a letter that he was “convinced that real progress in India can only be made through our own languages and not through a foreign language. I am anxious to prevent a new caste system being perpetuated in India—an English knowing caste separated from the mass of our public” (cited in Gopal, 1980:25). Philipson (2003:6) comments:

In fact, an English-using caste has emerged, because the management of multilingualism in India has largely been left to market forces. These strengthen the position of users of English, here as elsewhere. Roughly 30 million Indians are fluent users of English, but they account for under 5 per cent of the population.

Philipson (2003) mentions that there are elites in Africa and India who speak exclusively English to their children. Mazrui (1978) called them the Afro-Saxons. It is not uncommon for Indian grandparents, who do not speak English, to have no language in common with their grandchildren. Philipson (2003:75) further laments: “The young upwardly mobile, internationally oriented generation of Indians and Africans have more in common with ‘global’ culture than with the mass of inhabitants of India and Africa.”

Mohanty writes that there are now English knowing sub-castes in India, differentiated on the basis of the level of competence in English. Some pupils have superb English and have been schooled in very expensive private schools with excellent teachers. Another sub-caste of pupils have only average English, even though they too have gone to English-medium private schools, but less expensive ones. The lowest sub-caste of pupils are those with poor English from the low-cost private English medium schools. He questions the practice of low-fee private schools, which claim to be providing English-medium education, but which in reality fail to teach English and fail to teach the subjects which are supposedly being delivered through English. Mohanty (2017:275) describing the English knowing sub-castes asks: “Whose development does English promote?” As my example from Tanzania shows, the same question could be asked there as well as in the other so-called “anglophone” countries in Africa, where only about five percent of the population are fluent speakers of English.

Referring to the role of “the superimposed international languages” in the African context, Heugh (1999, 306) points out that “these languages serve only the interests of the elites”. Thus, any claim of a positive role of English in development cannot be taken to be a universal phenomenon. English is not a culturally neutral medium that puts everyone on the same footing; it empowers some and disempowers many.

In their chapter on Language Policy and Education in the Indian Subcontinent Mohanty and Panda (2017) write about the “double divide”—the hierarchical relationship between English and the major national/regional languages and the other divide between the major languages and the Indigenous tribal minority ones (ITM). On the Indian subcontinent English is promoted along with the major national regional languages, while the ITM languages are grossly neglected. Languages in education reflect the linguistic double divide; private schools use English as the medium of teaching-learning whereas public schools are in the medium of the dominant regional languages. The affluent send their children to the English medium private schools. This situation is rather similar to the one we find on the African continent, where there is a double divide between the former colonial languages English, French and Portuguese and the larger regional languages like Kiswahili, Hausa, Oromo, Amharic on the one hand and the regional languages and community languages on the other. In Tanzania Kiswahili is the language of instruction for all children in government primary school. Though the language is a national language, most newspapers printed in it and is frequently used on television, there are rural areas where the language is not so frequently spoken. Children in these areas start school in a language they do not speak (Brock-Utne and Qorro, 2015). They normally become quite fluent in Kiswahili through primary school. But in secondary school they have to cope with another language as the language of instruction. And this

language is a foreign language with no similarity to Bantu languages. English becomes the language of instruction in secondary school. At this stage a third of the students drop out of school, most likely because they do not understand what the teacher is saying.

From one colonial language to the other in Rwanda

The new language policy of Rwanda is likely to have disastrous effects on the learning of school subjects for thousands of children. Since independence from Belgium, Rwanda had retained French as the official language and so was termed a “Francophone” country, although the whole population, Hutus and Tutsis alike, speak Kinyarwanda and many of them also speak Kiswahili. In Parliament, in administration at the national level and in the Supreme Court, Kinyarwanda is the language predominantly used. Before the genocide Kinyarwanda was used as the language of instruction in the first three grades, then a switch to French occurred. [Schweisfurth \(2006\)](#) mentions that the Government of Rwanda after the genocide insisted on a trilingual education policy (Kinyarwanda, French and English) to secure greater equity between groups who favored one or the other language. A trilingual policy might have been good for Rwanda, provided that Kinyarwanda—a language that is spoken by 99.4% of the population, according to the Government—had been the language of instruction with French and English learnt as foreign languages (as subjects). In 2008, the international “development” partners and the new elite in Rwanda decided to do away with French and to introduce English from the first grade of schooling. English is the language of Rwanda’s new elite—especially the Rwandan Patriotic Front under the leadership of Paul Kagame and other Tutsi returnees from so-called Anglophone countries. This did not work and in 2011 Kinyarwanda was reintroduced as the language of instruction, but only for the three first grades and then a switch to English as the language of instruction occurs. In many schools, especially in the capital Kigali, English is the language of instruction from the very first grade of primary school. This policy was implemented in violation of recommendations by UNESCO and the African Union ([Brock-Utne, 2017](#)).

The situation in the Nordic countries

The intention of the European Union with its Bologna Declaration³ was to streamline educational standards in Europe. The streamlining also had the consequence of strengthening English as the language of instruction. According to Luc Soete, the Rector of Maastricht University: “National languages were perceived as a hindrance for student mobility akin to customs barriers, so the creation of an open market in English is another way for them to sell their educational products” (referred to by [Thomas and Breidlid, 2015: 350–351](#)). Some years back I was involved in organizing a European master degree program involving three universities, one in Belgium (Leuven, where the languages of instruction are Flemish and French), one in Finland (Oulu, where the language of instruction is Finnish) and one at the University of Oslo (where the language of instruction is Norwegian). The language of instruction of the whole master program was to be English, whatever university the students visited.

When I taught at the University of Dar es Salaam (1988–1992) many of my students said they wanted to come to Norway and continue their Ph.D. studies at my university. I had to tell them that if they wanted to do so, they had to learn Norwegian. At that time we did not have any Ph.D. courses in English. Neither did we have any master courses. But this has changed as witnessed in the table below:

Studies in English at Norwegian universities and colleges

Year	2007	2012	2016
Number of studies in English, all places of study	2379	4543	5798
Percentage of all studies offered in English, all places of study	8.9	15.7	19.6

Source: [Schwach and Elken \(2018:61\)](#).

In 1997 I took the initiative of organizing a master of Comparative and International Education at the Institute for Educational Research at the University of Oslo. The master started in 1998 and I was the leader of it most of the years until 2008. It was a study mostly for our students from Africa, Asia and Latin-America but some few Norwegian students also enrolled. I noticed that the Norwegian students actually commanded the written English language better than e.g., the Tanzanian students. For the Norwegian students it was the first time they were exposed to the use of English as the language of instruction while the Tanzanian students had used that language for at least nine years. The Norwegian students had had Norwegian as the language of instruction but learnt English well as a foreign language, taught by teachers who were experts in teaching English as a foreign language.

³The Bologna declaration (in full, Joint Declaration of the European Ministers of Education convened in Bologna on 19 June 1999) is the main guiding document of the Bologna process.

Academic publishing—in whose language?

The Swedish language activist Lindblom (2009) notes that during the period 1960 to 1979 90% of Ph.D. theses delivered at the University of Copenhagen were written in Danish and 10% in English. From 2000 to 2004 100% were written in English! (Lindblom, 2009). Schwach and Elken (2018:51) note that in 2017 90.8% of the Ph.D. thesis examined at Norwegian universities were written in English. Only 8.5% were written in Norwegian. Of these 7.9% were written in the urban variety of Norwegian⁴ and only 0.6 in the more rural variety of Norwegian.⁵

At the level of master theses there has been a clear increase in the number of theses delivered in English over the last 20 years.

Higher rewards for academic publications in English

In 1991 Norwegian state institutions were given the possibility of introducing “performance salary” as a part of local salary negotiations. Before that all associate professors had the same salary and so did all professors. The whole reward system fits well with the commercialization of higher education, which has also hit European universities (Brock-Utne, 2002).

In 2004 the Norwegian Association of Higher Education Institutions published a dossier called: *Vekt på forskning*⁶ (UHR, 2004). This publication institutionalized a reward system dividing journals and publishing companies into three levels, level zero (no reward given to the institution or researcher—most publishing companies in developing countries belong to this category—even if they publish in English), level 1 (reward given), level 2 (higher reward given—normally three times higher as level 1).

On the internet one can find a list of 486 ranked publishing companies. Of these 55 companies are ranked at level 2, while 431 companies are ranked at level 1. No Norwegian publishing company is ranked at level 2, not even the University Publishing Company. More than 80% of the publishing companies ranked at level 2 are based in the US.⁷

When it comes to academic journals, a list of 1758 ranked journals are given, among which a 10th are ranked at level two and the rest at level one. Only two of the many peer-reviewed academic journals published in Norwegian have been ranked at level two. Within the field of Educational Research no academic journal, where any of the articles is written in another language than English, has been ranked at level two (Brock-Utne, 2001b, 2009).

The engagement of many Norwegian academics in the defense of Norwegian as an academic language can be contrasted with the attitude of many Dutch academics. In 1989 Prof. Ritzen was appointed the Minister of Education in Holland. Minister Ritzen, who has a doctoral degree both in economics and physics, and had studied in the United States, had as a professor of economics in Holland felt frustrated because of the use of Dutch in the academia. As a Minister he now proposed that English should be the sole medium of instruction in all Dutch universities. His proposal met with overwhelming support from the academia. His proposal met, however, with harsh critique when it was presented in Parliament. Parliament insisted on regulating the language issue because it neither trusted the Minister,⁸ nor the academics. Therefore Parliament passed an amendment to the university law now saying that no courses can be offered in another language if it is not offered in Dutch. This was actually seen as a step backwards for those professors who wanted more English language instruction in Dutch higher education. There has, however, still been a steady growth of Master courses taught in English within Dutch higher education.

Some years back I felt that there was an acute need for a textbook in comparative and multicultural education written in Norwegian. I took the initiative to edit such a book, which appeared in 2006 (Brock-Utne and Bøyese, 2006). With two exceptions all the authors were native Norwegians. We all did most of our academic writing in English. Almost all the authors, including myself (Brock-Utne, 2006) had problems finding academic terms in Norwegian, describing phenomena we normally wrote about in English. Not long after the book was published my institute decided that the course in comparative and international education at the Bachelor level, which had been taught in Norwegian, should hereafter be taught in English. That may be one of the reasons why the book has not reached the sale figures we had hoped for.

The 2008 White paper on Norwegian language policy

In the summer of 2008 the Norwegian Ministry of Culture and Church presented a White paper to Parliament on Norwegian Language policy.⁹ I found that the paper was disappointing on two accounts and wrote an article in the largest Norwegian newspaper, *Aftenposten*, about this (Brock-Utne, 2008). This article led to a radio debate between the Minister of Culture, Trond Giske from the Social-Democratic party, and me on the July 21, 2008. The Norwegian government in 2008—the so-called red-green government—was a coalition consisting of the following three parties: The Social Democrats, the Center party and the Socialist Left party. These three parties together with the Christian People's party in 1995 had Parliament adopt the paragraph: “The language

⁴This variety is in Norwegian called bokmål and is developed from Danish.

⁵This variety is in Norwegian called nynorsk and is built on dialects spoken all over Norway.

⁶In English: Emphasis on Research.

⁷This is the web-site dealing with the ranking of publications: <https://dbh.nsd.uib.no/publiseringskanaler/Forside>.

⁸Former Minister Ritzen later worked in the World Bank in Washington DC.

⁹The White paper was called *Mål og mening. Ein heilskapleg norsk språkpolitikk* (Language and meaning. A holistic Norwegian language policy).

of instruction in Norwegian universities and colleges shall as a rule be Norwegian” as part of the Law of Universities and Colleges. But the bourgeois coalition government in the beginning of the new millennium—consisting of the Conservative party, the Liberals and the Christian party saw to it that this paragraph was taken out of the University law of 2005, even though Norwegian is more threatened as an academic language to-day than it was in 1995.

One would have expected that the red-green government would argue in their White Paper on Norwegian language policy for reinserting this paragraph in the Law of Universities and Colleges. The White Paper “Mål og mening” mentions that the Norwegian Language Council in 2006 had suggested to reinsert this paragraph. The White Paper argues against the Language Council as the Minister of Culture did against me in the radio debate in July 2008, maintaining that deletion of this paragraph was a consequence of the “internationalization of higher education.” But it is exactly the pressure from the internationalization of higher education which requires a legal protection of the Norwegian language in places of higher learning. In 2001 the Legal Court of the EU denied Iceland the right to have lower taxation of Icelandic literature than of literature written in foreign languages—a practice Iceland had embarked on to protect their own language. Knowing about this fact I asked our Minister of Culture whether he was afraid of sanctions from the EU if Norway wanted further promotion of the Norwegian language through legal measures. The Minister chose not to answer that question.

My other caveat when it comes to the White paper of the Norwegian Language policy of 2008 has to do with the fact that the paper goes against the proposal from one of our law professors, Professor Ola Mestad, of giving the Norwegian language legal protection in our Constitution like France has done for the French language. The indigenous minority language, the Saami language, is given legal protection in our Constitution—the majority language, Norwegian, is not.

Norwegian researchers defending our language as a language of research

Norwegian academics seem to be more prepared to defend the Norwegian language as an academic language than colleagues in some other European countries, like especially in the Netherlands.

On the fifth of May 2006 a petition in defense of Norwegian as an academic language signed by 223 well-known Norwegian professors from the humanities and the social sciences was published in our largest newspaper *Aftenposten*. This is the newspaper which also had been the leading news channel for the debate. The Norwegian case shows how a smaller European language, like Norwegian, is threatened as an academic language. When Norwegian academics are discouraged from publishing in Norwegian, it means that academic Norwegian will deteriorate and vocabulary will not be further developed. We shall reach a situation, which African academics are in, when they have difficulties discussing academic matters in African languages because the academic concepts have not been developed in their languages.

All languages develop through use and they also fail to develop or stagnate through disuse.

Where there is a political will—an example from Tanzania

At the University of Dar es Salaam there is one department that uses Kiswahili as the language of instruction and one research institute that uses Kiswahili as the language of communication. The department is the department of Kiswahili and the research institute is the Institute of Kiswahili Research. Also this department and research institute used to be run in English. There were big discussions before the language was switched to Kiswahili. Some of the lecturers and researchers claimed that it would not be possible to teach and write in Kiswahili because they lacked terms for “guttural sounds”, “phonemes”, even “terminology”. Others said: “we shall just invent these terms as we go along.” That became the political decision and now all the linguistic terms have been developed in Kiswahili. The terminology (istalahi) has been developed. This means that there is no problem in holding a linguistic conference in Kiswahili in East Africa.

Prestige Planning

Kamwangamalu (2015) suggests that language-education planning needs a paradigm shift. Rather than critiquing inherited colonial policies, he proposes what he calls *Prestige Planning* for African languages. According to Kamwangamalu (2015:14) Prestige Planning:

... entails associating African languages with an economic value on the labour market and requiring academic skills in these languages as one criteria for access to employment

The focus is on the reception (and not on the production) of language planning. Kamwangamalu (2015) argues that until African languages are associated with a market value, English will continue to dominate the educational systems of African Commonwealth countries, much as it did in the colonial era. But how can African languages be assigned a market value to

make them instrumentally competitive with English at least in the local labor market? The call for Prestige Planning for African Languages is made against the background of theoretical developments in language economics (Grin, 1996; Vallancourt and Grin, 2000). Kamwangamalu proposes Prestige Planning for African languages if these languages are to become, like English, an instrument of upward social mobility.

While the translanguaging approach being used especially among the black learners in South Africa (Makalela, 2014) or the code-switching approach used in many other African countries are strategies used on the micro-level, Prestige Planning is a macro-strategy which requires political willingness to change the power relations in a country. It is a strategy that would lead to the development of the majority population of Africa and thereby the African continent.

In this paper I have shown the hegemonic dominance of English in education and its consequences for the majority population in the so-called Anglophone countries in the developing world. The Anglo globalization of education has also hit non-English speaking countries in Europe, undermining the national languages as languages of academic publishing and research.

Introduction

Contemporary higher education is submerged by rapid social, political, economic and cultural transformations, which affect most countries in various ways and have an impact on its functioning. Changes in higher education in Middle East and North Africa (MENA) countries are linked to globalization, understood as a multidimensional economic, political and cultural process, which dynamic have direct and indirect repercussions on universities. In the context of globalization, economic, political and cultural activities do not stop at the boundaries of national societies, but tend to transcend territorial boundaries. Overall, MENA region lags behind most of the rest of the world on many key indicators of higher educational development. Although several countries in this region have profited greatly from the considerable wealth derived from large oil and gas revenues over the past half century, universities are not performing high in international comparisons.

The term globalization within the university context typically refers to the increasing willingness of universities to be open to international influence: exchange programs, staffs and students, expand partnerships between institutions based in various countries, and to harmonize academic programs. Such globalization may be highly desirable. Yet, globalization affects actors in a highly disproportionate way. Under the guise of a universalist or international narratives, it increases inequality, reinforces a competitive approach of learning, and removes national specificities and interests. Because their activities take place in an economic, historic, social, and geographic context that obviously cannot be conveyed by few indicators or standards, universities are affected in various and different ways by globalization (Strassel, 2018).

Figge and Martens (2014) categorized globalization according to four different trends: (1) internationalization, that is, transactions across country borders; (2) liberalization, in reference to the policies or efforts for neoliberal economic globalization; (3) universalization or Westernization, which is the spread of certain values, objects and experiences; and (4) de-territorialization, in reference to international connections with a significant autonomy from territorial locations and national borders. These 4 trends apply with different intensity in the MENA region and radically transform the landscape of higher education.

Globalization affects state education policies, with specific consideration of the balance of transnational/international forces and national resistances, capacities and responses. This relationship between the global and the local in education is a core preoccupation and relates directly to the possibilities for a politics of education (Ozga and Lingard, 2007). Internationally oriented public universities are caught between their internationalizing student bases and research aspirations on the one hand, and the priorities of their national and sub-national governments as public funders on the other (Knight et al., 2021).

In particular, in many countries across the MENA, globalization increased the weight of international organizations and the privatization and commodification of higher education. As suggested by Robertson et al. (2007), a key element of globalization is the thickening of multilateral interactions and interconnections in the global governance landscape. The traditional International Organizations (IOs), such as the UN institutions (World Bank, UNESCO and ECLAC) and the OECD, are now joined by an expanding array of non-governmental international organizations and transnational firms. Another effect of globalization is that higher education sector, having modeled its goals and strategies on the market-oriented and entrepreneurial business model, is compelled to embrace the corporate ethos of the efficiency, accountability and profit-driven managerialism (Zajda, 2020).

From nomadic scholars to colonial dominance

Universities in the Arab-Muslim world began to emerge between the ninth and the 10th centuries. These include Ez-Zeituna (737, Tunisia), Al Quaraouiyine University (859, Morocco), al-Azhar University (970, Egypt) and Nizamiyyah University in Baghdad (Iraq, 1062). Some historians limit the concept of university to the Euro-Christian world. However, we can say that medieval Islamic universities saw the emergence of many scholars in diverse fields of knowledge ranging from mathematics to philosophy. Major ground-breaking advances in mathematics, astronomy, optics, navigation, architecture, irrigation and agriculture, medicine, and the development of hospitals, commerce and trading, and the willing acquisition of transcultural knowledge were special features of the Islamic Golden Age (Hillman and Baydoun, 2018; Lai et al., 2016).

Two characteristics deserve to be highlighted in this golden age of Arab-Muslim universities: the multiculturalism of ancient universities in the MENA region and the links with other civilizations, in particular, Europe. On the one hand, the crossing of ethnic, religious and continental borders of thinkers. Many thinkers in Arab-Muslim universities came from regions far from the center of Arab-Muslim civilization. They can come from India, Central Asia, Andalusia and sub-Saharan Africa. They can also be of Jewish faith. These thinkers circulate in the Arab-Muslim space. For example, al-Farâbî circulated between Kazakhstan and Syria. Ibn Khaldoun navigated between North Africa, Spain and Egypt. They were truly nomadic thinkers. Hence, multiculturalism and multilingualism characterize medieval thinkers in the MENA region. On the other hand, there were many links and exchanges of ideas with other civilizations. Ties have been intense with Europe, Africa, India and China. In Europe, what is attested is the contribution of Arab scholars to knowledge by translations from Arabic to Latin of philosophers and thinkers of Arab-Muslim culture: al-Kindi (802–866), al-Farâbî (850–950), Ibn Sinâ (Avicennes) (980–1037), Ibn Rushd (Averroes) (1126–1198). The density of intellectual exchanges between the so-called Arab-Muslim civilization and the rest of the world is a reality that is difficult to deny (Freely, 2010).

However, progressively Guardians of Islamic law (Sharia) developed an uncaring attitude toward secular disciplines, critical thinking and excluded them from the curriculum of the madrasa system. This action deprived the Islamic education system from intellectual challenge and stimulation. Learning by rote, a process that encourages instruction rather than original and critical thinking impoverished intellectual creativity in the region.

First modern universities were founded in the MENA region during the political turmoil of the late 19th century, which brought together the Arab awakening, decline of the Ottoman Empire, and European colonialism and imperialism. Education and higher education were associated with nationalist and geopolitical issues in the region. While Arab nationalist seek to take control of higher educational institutions, Western powers were engaged in a severe competition in higher education. The creation in 1865 of the Syrian Protestant College (future American University of Beirut), followed ten years later by the foundation of Saint Joseph University by a French Jesuit mission exhibit the intense cultural transfer between Western World and MENA region during this period. Competition of colonial powers and nationalist struggles combined here to confer significant symbolic power to higher education, in Egypt, Lebanon and Palestine in particular (Romani, 2012).

University as a national development project

After World War II, the newly independent Arab States progressively promoted an equalizing nationalist ideology and staked their legitimacy in their ability to foster economic development and provide social welfare to their citizens. Education was a central component of the states' nation-building projects. Higher education became an important means to garnering political support from the upwardly mobile middle classes, while also centralizing state power (Mazawi, 2005). A new dynamic contributes to the politicization of the question of higher education in the Arab world after the Second World War and the newly acquired independence. New national governments started ambitious development programs, which focus on education, technology and science (Siino, 2003). In this context of the "developing state", both in the version linked to the western bloc or in the other version linked to Soviet Union, many universities of research institutes were created in the region, often with the government guarantee of employment for any university graduate. From Iraq to Morocco, thousands of students accessed higher education until then the prerogative of narrow social elite (Siino, 2003).

It is possible to point out both massification of higher education in MENA and durability of social inequalities by the end of 20th century. In Egypt, higher education increased from just above 10% among those born in 1955 to almost 30% by the 1985 cohort. In Jordan, higher education amplified from around 25% for the 1955 cohort to almost 40% by the 1985 cohort. Tunisia's education system expanded later than Egypt or Jordan. Higher education was below 10% for cohorts born into the 1970s, but higher education expanded rapidly in recent decades, approaching 30% by the 1985 cohort (Krafft and Alawode, 2018).

Despite this rapid growth in higher education enrollment, there is substantial inequality of opportunity in Egypt, Jordan, and Tunisia. Tunisia and Egypt had the most important inequality of opportunity, whereas Jordan was considerably less unequal. The two primary drivers of inequality in Egypt are mother's education (27.2% of inequality) and father's education (42.3% of inequality). There are also smaller contributions from father's work sector and region. Jordan has less inequality of opportunity. Jordan would need to redistribute 18.7% of opportunities to be equality of opportunity. The inequality in Jordan is primarily related to mother's education (35.8%) and father's education (43.0%). Father's job sector as well as number of siblings also contribute to inequality. Inequality is high in Tunisia, where 37.3% of opportunities to attain higher education would have to be redistributed for equality of opportunity to prevail. This inequality is driven primarily by father's education (42.9%), followed by mother's education (22.1%) and urban/rural disparities (15.8%). There are small contributions from father's work sector, region, and number of siblings. Across countries, sex contributes less than 3% to inequality (Krafft and Alawode, 2018). An important finding of Krafft and Alawode (2018) is that, despite policies centered on free public education, equality of opportunity in higher education does not prevail in MENA. Free higher education is a regressive policy that primarily benefits the rich. The two countries that guarantee free public higher education, Egypt and Tunisia, have the highest inequality of opportunity.

There were about ten universities in the Arab world in the 1940s. The number is in the hundreds today. The share of the rich Gulf countries in this quasi-exponential growth is itself growing. A particular feature of this university boom is the overlap of privatization and claimed globalization. Two-thirds (or about 70) of the new universities founded in the region since 1993 are private, and are mostly branches of US universities. Even in Saudi Arabia, the government, which operates 8 public universities, agreed in 2008 to establish two private universities and numerous post-secondary education institutes (Romani, 2012).

Table 1 Gross enrollment ratio for tertiary education, both sexes (%).

Country	2013	2014	2015	2016	2017	2018

Arab states	28.33	29.60	31.17	31.98	32.90	33.36

Prepared by author using data from UIS-UNESCO (2020).

Table 1 below compare ratio for tertiary education in several MENA countries. We observe both important growth between 2013 and 2018 and differences between countries in the region. Saudi Arabia has the highest enrollment rate (68%) and Mauritania the lowest (5%).

According to [Calderon \(2018\)](#), gross enrollment ratio of Arab States in 2016 (32.0%) which stood at the same level of Latin America and the Caribbean in 2006 or the world's average in 2012. This improvement in participation is a result of increased diversification and focus on part of states to develop higher education, based on the US-style liberal arts institution model in the Middle-east and on the French public model in the Maghreb. Higher education reform in the region is confronted with a myriad of challenges that spread over demographic, political and economic considerations, and these are unlikely to overcome in the next years. States in this region with the largest number of enrollments are Egypt (2.8 million in 2016), followed by Saudi Arabia (1.6 million) and Algeria (1.4 million).

International cooperation and privatization

Globalization of higher education is slow because of the following realities and constraints. First, educational systems all over the world have to preserve political and cultural identity and serve political and ideological objectives. Second, universities and other higher education institutions worldwide retain their autonomous, individualistic, institutional and elitist characteristics. Even today, universities and other tertiary institutions are sealed into national contexts and most especially in developing countries, are state institutions. Third, it is a fallacy to talk about the globalization of higher education where social and economic inequalities are extensive ([Ishengoma, 2003](#)).

While national context is still the most important factor shaping university, we observe worldwide a growing impact of globalization on Higher education in the 21st century. In MENA region, we consider that international organizations and privatization are two key tenets affecting higher education and its links with globalization. For a decade or two after gaining independence, national higher education systems in MENA countries were structured and functioned primarily within the boundaries of individual countries. However, from the mid-1970s, a series of new phenomena, directly and indirectly linked to higher education, appeared and considerably modified its modus operandi to extend its presence and action beyond national borders ([Martins, 2019](#)).

As a global player in international cooperation, the World Bank is involved in almost all MENA countries in projects to reform the governance and to improve the quality of education of higher education. This involvement comprises both funding but also diagnostic and policy recommendations ([Samoff and Carrol, 2003](#); [Shahjahan, 2012](#)). The [World Bank \(2008\)](#) called MENA countries for flexibility and additional public funding that could be associated with outcomes and innovation, thus ensuring accountability for performance. Professionalization of staff was also considered as a top priority. The European Union within the framework of EUROMED policy ([Fouchet and Moustier, 2010](#)) adopted in the region the same line of conduct than the World Bank. In addition, bilateral cooperation particularly in the Maghreb shaped higher education reforms ([Mullin, 2017](#)).

Privatization and blurring of the lines between public and private characterize the financing of higher education in the MENA region. While privatization is high in many countries, it presents contrasting management models illustrating diverse degrees of government control over higher education. In Qatar, funding is mainly public through the Qatar Foundation. Since 2003, the campus called Education city has hosted at least 9 foreign universities (6 US, one French, one British) in addition to a Qatari university and a dozen research centers. The state covers construction and investment costs there but the universities remain private and

relatively autonomous. In the United Arab Emirates, the International Academic City was established in 2007 in Dubai, where it is part of the "Knowledge Village", built in a free zone and hosting 27 universities, mostly foreign. Funding is more symmetrical there because these universities have to cover their own expenses, in what is referred to as a co-investment operation. Finally, in Saudi Arabia, government control remains the main norm. King Abdullah University of Sciences was founded in 2009, with a sovereign wealth fund of \$10 billion, making it the richest university in the world even before it started operating (Romani, 2012).

The privatization of universities in the MENA region is unfolding mainly through four mechanisms found in other parts of the world. First, privatization can be linked to historical arrangements that have seen the emergence of private universities linked to religious minorities. This is typically the case in Lebanon, Syria and Palestine where the birth of private universities at the end of the 19th century was linked to Christian religious congregations.

Second, we find privatization linked to public policies aimed at increasing the proportion of students in private universities. This can be accelerated by regulatory and fiscal incentives from the state or by public-private partnership (PPP). We may consider offshore campuses as a form of PPP, particularly in the rich gulf states where public funding is used in building a network of foreign universities.

Third, privatization can also emerge through the degradation of the quality of public education and the dynamism of private entrepreneurs, finding in higher education an opportunity for economic gain.

Fourth, privatization is also an ideology/trend present in public universities by the promotion of good governance, accountability and entrepreneurship.

While these four mechanisms of privatization are present in most regions of the Global South, it is important to observe two specificities in the MENA region. The first is the key role played by the state in promoting and accelerating privatization. By injecting a lot of public funding used by private universities, the state is a main player of privatization. The second specificity is the historical mission played by private universities in promoting foreign models of higher education, mostly the Anglo-Saxon model, but also the French model and to a less extent and more recently the German, Japanese or Turkish models.

In Lebanon, students in private higher education come from the middle-class families, i.e., government officials and employees of the public and private sectors benefiting from collective agreements, granting a financial support for their children education. Taking advantage of this principle of freedom of choice of school, the overwhelming majority of these civil servants and employees choose private education, including at the university level, in search of better quality, but also of the symbolic prestige attached to elitist private universities. Thus, we observe the existence of a subtle mechanism that allows private higher education to be partially financed with public funds (Kabbaj, 2012). This situation illustrates the blurring borders between private and public sectors.

Alliances, collaboration, and partnerships forged between higher education institutions in the North and South are one-sided and often benefit one side only. In a situation where countries and multinational corporations in the North are dominating the process of globalization, to talk about globalization of higher education is synonymous to neocolonialism or academic imperialism in higher education. South countries have little to offer in the process of globalization other than receiving whatever accrues from the process. Educational globalization may be not different from such earlier concepts as neocolonialism, dependency, or center-periphery (Ishengoma, 2003).

It is also important to observe that privatization is not following the same trend in the sub-regions across MENA: The Maghreb, the "Middle East," and the Gulf (Oil) States. Compared to the Middle East where privatization of higher education is old, North Africa seems to be more reluctant to massive privatization: « The nations' strong orientation toward the French model, and its commitment to a free public system were specifically cited as the reason for the decade long delay in the implementation of Morocco's privatization reforms and Tunisia's continuing hesitance to support private higher education. » (Buckner, 2018, p. 1302). However, the growth of private higher education both in quantity and quality have been observed in Morocco, Tunisia and more recently in Algeria in the last two decades. In the Gulf States, higher education development is recent and privatization is a policy endorsed and supported by the state. Offshore campuses and foreign university represent a significant share of higher education enrollment (Powell, 2014).

After several decades of international cooperation and privatization, the results of higher education in the MENA region are weak. Young people and their family invest in their higher education with hope to get better job and greater opportunities. However, higher education has become a source of widespread frustration because it is not delivering the skills and competencies needed by young people today. Universities in the region are still centered on credentials rather than competencies (El-Kogali, 2018). Rather than leading to qualified jobs and greater well-being, a university degree in the MENA region is more likely to lead to frustration, and a dead end of unemployment. More curious is the situation of the rich countries of the Gulf who have invested heavily to build public and private universities of good quality. Yet, these countries are experiencing a high unemployment rate of national graduates while importing numerous foreign workers with a university level. The achievements of Arab higher education systems do not seem to be on par with the economic weight and the long scholarly tradition of this region. Compared to emerging economies in Asia and Latin America, Arab higher education systems are way behind in terms of quality and research outcomes. They suffer from relatively high levels of graduate unemployment, and are characterized by inadequate governance arrangements (Salmi, 2015).

Furthermore, Arab universities are in low position in the world university rankings. In the top 500 places of the Shanghai ranking, since its launch in 2003, only 5 of the 550 Arab universities appear, compared to 7 of the 9 Israeli universities (El Amine, 2016). Higher education sector in the MENA region (and particularly in the gulf) is thriving, with billions of dollars spent on impressive-looking infrastructure over the past three to four decades, the rapid growth in the number of young people (including women) enrolling at universities and tertiary colleges, and the recruitment of thousands of expatriate academics to work in regional

universities. However, this is a misleading impression and even with the huge sums of money spent on building infrastructure, it is evident that there are very few excellent universities in the MENA region.

According to Forster (2018), the reasons leading to this situation are diverse. First, the lack of investment in research and development at universities across the MENA region. Countries in the MENA region collectively spend a comparatively low amount of capital on R&D, and on both basic and applied scientific research in universities. In 2013, the 57 member countries of the Organization of the Islamic Conference invested just 0.81% of their annual gross domestic product (GDP) on R&D. The Muslim world as a whole spends less than half of 1% of their cumulative GDP on R&D, compared to an average of about 5% in the countries affiliated to the Organization for Economic Development (OECD). Second, the lasting absence of intellectual freedom and the constraints and limitations imposed on free expression of ideas and academic freedom in universities in the MENA region. While a lack of investment in high-quality research at MENA universities is one plausible reason for their low ranking, it does not provide a complete explanation for this. For example, several scholars have asked if states of the Gulf and broader MENA region will ever encourage the academic standards and intellectual freedom that are necessary to generate the “world-class research” they often claim to support in their public speeches and in their national economic development plans. Third, the failure of universities in the MENA region to encourage, monitor and reward high-quality and high-impact research across all academic disciplines. While the volume of research generated in the MENA region has increased over the last 15 years, there are no indications that research quality and impact have also been improved. For example, the overall impact rating of scientific research publications from all universities in the MENA region was 0.33 in 2016. This was well below a global average of 1.00, and significantly lower than the impact level of publications from the world’s top 500 universities (Forster, 2018).

The anti-scientific mind-sets of some ruling political elites, of Islamic theologians and of those who are responsible for the oversight and administration of universities in the MENA region provides some clarification of the low productivity of higher education. Many scholars have suggested that Islam, and its pervasive influence in primary and secondary education throughout the entire MENA region, is one of the principal reasons why this part of the world is still characterized by so many endemic and deep-seated problems—including what appears to be an almost instinctively anti-scientific worldview. Islam’s most influential theologians all promote the belief that spiritual and secular authority are inseparable, and the latter must—in all circumstances and at all times—be subservient to the former (Forster, 2018). However, we have observed a process of innovation and critical academic thinking emerging in universities in countries such as the United Arab Emirates, Lebanon, Jordan or Tunisia.

In addition, MENA universities are disadvantaged in respect of academic publishing. Such publishing is typically in the form of articles in scholarly journals, in book form, or as theses, usually with peer-review and/or editorial oversight. Few universities worldwide have their own publishing houses. There are no Arab journals in the sciences and humanities that are universally regarded as being high impact academically at a time when the global literature is becoming dominated by the use of English, western journals, and citation systems developed in the USA and Europe. Financially weak and poorly supported, Arab academic societies are unable to redress the disadvantage (Hillman and Baydoun, 2018).

Universities, especially the newer ones, are running out of steam in their attempt to identify with the dominant models in hegemonic countries from their initial position as dependent universities, which relegates them to a peripheral role. In this context, such creeping standardization risks being reflected not only in a race to the bottom in terms of university education and training, but also in a shrinking of the university public space and, in its wake, of the education as a public good, with the continued regression of the place and role of the public university (Kabbaj, 2012).

Rethinking university in MENA uncertain times

Higher education in the MENA region is at a crossroads and it is urgently needed to rethink it, particularly in terms of governance and the university’s mission in national development.

Some observers call for a revision of models of higher education governance in MENA region. El Amine (2016) analyzed governance models in Arab public and private universities. In public universities, he distinguishes 4 models: (1). The electoral model (Tunisia), (2). The bureaucratic model (Egypt), (3). The politicized model (Lebanon) and (4). The controlled model (Jordan). The governance models in private universities are: (1) The business model, (2) The community model and (3) The autonomous model. In comparison with international models of university governance, Arab public universities are very far from the academic type that had been historically established in Europe. They are also far removed from the market-oriented (neoliberal) type prevalent in the United States or in private universities around the world. Rather, they can be classified in the state-centered type but with some differences between countries. We can say that their main points of divergence from the European state-centered type are their submission to government and the involvement of political bodies from top to bottom, or both ways. The inter-Arab divergences refer to social structures, the relationship with the State, and the union movement, etc. As for the non-public universities, they are polarized either toward the market or by a community organization, or both at the same time. The product of this bipolarity between politics and the market is the loss of autonomy, the weakness of academic freedom and the deterioration of overall quality (El Amine, 2016).

There are a number of important differences in states’ reform strategies in MENA region. Bucknera (2011) classifies states’ reform strategies into three major groups: Neoliberal, Quality Assurance, and Imported Internationalization. Neoliberal reforms aim to expand access to higher education while offsetting costs to consumers and the private sector. Egypt and Tunisia both initiated neoliberal reforms over a decade ago. However, they have not been as successful as Jordan. Today the percentage of youth in higher education in both countries is approximately 30%, but the percentage in private universities is only less than 5% of total enrollment

in higher education. In contrast to the neoliberal model, North African states are emphasizing the importance of the state in providing higher education while pursuing strategies to strengthen the internal and external efficiency of tertiary education. In addition, in all three Maghreb countries of Tunisia, Algeria, and Morocco, the Ministries of Higher Education have recently pursued large-scale quality assurance programs inspired by the Bologna process by restructuring degree requirements to accord to a Bachelors- Masters-PhD system. This approach attempts to align the higher education curricula with European models and permit the mobility of qualifications and labor cross-nationally. The third model of higher education policies pursued in the MENA Region is that of Americanization, whereby the desire to “modernize” higher education systems has not only taken the form of extensively privatizing the provision of higher education, like many neoliberal states, but also establishing extensive international partnerships with American and British universities. A number of scholars have examined how these institutions are changing tertiary education in the UAE, Qatar, Kuwait and Saudi by linking it to global trends.

Zewail (2011) suggested a fourfold strategy to reform higher education in MENA region: (a) Achieve the full emancipation of Arabic women and ensure their full participation in civic, economic and political life; (b) Make reforms to national constitutions to allow freedom of thought, decreasing of bureaucracy, development of merit-based systems, and the creation of credible and enforceable legal codes (c) Build centers of excellence in science and technology in each Muslim country to show it can be done, to show that Muslims can indeed compete in today’s globalized economy, and to instill in their youth the desire for learning and (d) Develop more partnerships between leading Western universities and those in the region in order to improve their research capabilities.

The other dimension to be clarified is the mission of university in the region and its relationships with socioeconomic development. The Arab world represents 5.8% percent of the world population and produces 4.5% percent of the planet’s GDP, but its universities account for only 0.08% percent of the top 500 institutions in the Shanghai ranking. The poor results of a large country like Egypt—the 15th most populated nation of the world—are striking in contrast to the impressive performance of a small country such as the Netherlands, which places four universities in the top 100 of the Shanghai ranking. The tiny territory of Hong Kong has more universities in the Shanghai ranking as all Arab countries considered together (Salmi, 2015).

While participating in economic globalization and the internationalization of higher education, the countries of the MENA region have weak capacities to orient these processes in the direction of their own interests and national development. As stated by Ishengoma (2003), many countries in the global South are in danger of being largely excluded from the whole process of globalization, this exclusion will also apply to higher education.

Missed links between education and development

It is important not to limit the analysis of university situation in the Arab countries to the education sector alone. Indeed, education is part of a socio-political and economic ecosystem favorable or not to the production of knowledge. The apparent paradox is that the Arab countries have not reaped the fruits expected from massive investments in education. Obviously, “schooling” and “socio-economic development” have no mechanical ties stipulating that investing in schooling would automatically allow economic to leverage. Harber (2014) suggests rightly for the “need to be cautious about the assumed automatic benefits of formal education for development” (p. 18).

In addition, the fragile legitimacy of political regimes in the Arab countries does not allow higher education to contribute to better participation of young people in civil society and political life. Education systems produce unemployed graduates whose voices are rarely heard in the political arena. While the Arab Spring movements made possible more youth participation in some Arab countries, a great disillusionment of youth persists everywhere due to the absence of economic prosperity.

Several researchers have identified low rates of return to education in the Arab world as a fundamental cause of the current socio-political unrest and upheaval (Fargues, 2011; Shafiq and Vignoles, 2015). Using years of schooling, Patrinos and Montenegro (2014) estimated that the rate of return to schooling in the MENA region is 5.6%, which is considerably behind the rest of the world. Using empirical data, Kingsbury (2018) tested several hypotheses to explain the low return to schooling in Arab countries. The first hypothesis stipulated that religious orthodoxy overwhelm the return on investment of education, including mathematics, science and foreign languages. The second hypothesis developed by Kingsbury (2018) suggested that poorly performing schools in the region had a negative impact on quality. The third hypothesis indicated that the region’s dependence on natural resource exports limits returns to education. The fourth hypothesis, more difficult to corroborate with empirical data, suggested that corruption, nepotism and non-meritocratic government policy (coupled with the absence of the implementation of law) reduce returns to education. However, it is necessary to discuss certain hypotheses of Kingsbury (2018). The over-representation of religious content is not present in all the countries of the region. Additionally, education systems in the region are very open to foreign languages, especially in the Maghreb and Middle East countries.

In a recent empirical study, Blackeburg and Tholen (2018) pointed out that the share of young people suffering from social exclusion is the highest in Tunisia, followed by Algeria, Egypt, and Lebanon. Youth exclusion does not affect only the young generation but society as a whole. Social exclusion as a function of the respondent’s employment status varies significantly across countries. In contrast to Lebanon, where unemployed young people feel especially excluded, young people in Algeria, Egypt, and Tunisia are more likely to be assigned the status socially excluded if they are employed. A finding pointing toward the dominance of the informal sector.

During the 2000s, Devarajan and Ianchovichina (2018) suggested that inequality in Arab countries was low or moderate and, in many cases, on its way of declining. Different measures of wealth inequality were also lower than elsewhere in the world. Yet, there were revolutions in four countries and protests in several others. Devarajan and Ianchovichina (2018) explained this so-called

“inequality puzzle” by first noting that, despite favorable income inequality measures, subjective well-being measures in Arab countries were relatively low and falling sharply. This fall was especially true for the middle class and in the countries where the uprisings were most intense. The increasing of disappointment, reflected in perceptions of deteriorating standards of living, was associated with dissatisfaction with the quality of public services, the shortage of formal-sector jobs, and widespread corruption. The transition to the labor Market is characterized by unemployment, long waits and informality (Dhillon et al., 2009).

These sources of dissatisfaction suggest that the old social contract, where the government provided jobs, free education and healthcare, and subsidized food and fuel, in return for the subdued voice of the population, was broken. Thus, it became clear that this social contract was not sustainable. In particular, the fiscal deficits associated with public-sector employment and high subsidies were becoming unsustainable. Governments slowed down, and in some cases, stopped hiring workers. Unfortunately, the private sector did not create jobs fast enough to absorb the large number of young people entering the labor force. MENA has the highest unemployment rate in the developing world, with the rate for young people and women about double the world average (International Labor Office, 2020). This problem is worsening due to the emergence of COVID-19 pandemic; that forces governments of all countries to close their operational sectors, as a result, this affects the economy of most countries, and Arab countries are not an exception, many lost their jobs in addition to those who have not got any job yet. A dislocation exists between policy discourse, which emphasizes the centrality of education for work in the process of economic development, and the inability of Arab State to penetrate society effectively (Mazawi, 2007).

The development of higher education should in theory contribute to the reduction of social inequalities, improve access to employment and make the participation of citizens more tangible in political life. The paradox is that the results of the MENA region are mixed on these three levels despite advances in schooling. The progress in education in the Arab region over the past decades should be seen in the light of patent inequalities in the level and quality of education received. These inequalities are illustrated through a differing schooling experiences depending on the social background of the students: Children from privileged socioeconomic backgrounds versus children from disadvantaged socioeconomic backgrounds. Most often, the first attend private school and benefit from quality foreign language teaching—Children living in urban (coastal) areas versus children living in rural (interior) areas. Most often, the latter endures poor conditions of schooling, including insufficient and untrained teachers. Schools are overcrowded and under-equipped, and working in two-shifts, especially after the Syrian crisis, many countries received flux of refugees, like Jordan, Egypt, and Lebanon, the governments accepted students at the age of primary stage to be enrolled at public schools UNRWA schools. Since the capacities of these schools are already limited, having extra number of refugees added more pressure on the educational systems, and thereby affecting the quality of education.

In an ethnographic study, Boutieri (2016), analyzes the arrangement of the different education streams in secondary education in Morocco and dissects the inequalities based in particular on language skills. The most popular options and those most likely to lead to employment after schooling are the scientific and technical streams. In this context, the humanities streams are abandoned to the poorest students from disadvantaged social backgrounds. The bifurcation between school subdivisions takes place at the end of the third year of secondary school. Boutieri (2016) emphasizes that to gain a place in the scientific fields, one must not only have obtained good grades in science and mathematics, but also in French (with a view to continuing studies at university level). Thus, even if chemistry, physics or mathematics courses are given in Arabic at the secondary level, enrollment in a scientific field and subsequent success in these studies paradoxically depend, largely, on mastery of a foreign language, French or English. Arab education systems still have the footprints of colonial encounter in that they remain elitist, lack pertinence to local contexts and are often disconnected from local knowledge and wisdom. Arab society and education systems remain engaged with a Western-driven project of modernity and a consumerist dependence on foreign markets (Mazawi, 2006).

Based on that, social inequality has emerged and it is partially associated with the limited and low-quality skills that many young people acquire in the Arab world because of their low-quality schooling, as they mainly focus on rote learning rather than high-order thinking skills. Likewise, the authorities of the Arab region could not afford the youth sufficient number of jobs and opportunities to take their places as responsible and productive members in their societies. In this vein, it is undeniable that the current social, economic and educational systems could not help the youth to make their dreams come true and become productive members in their communities. On the one hand, there is the story of poor economic performance, characterized by volatility between high and low growth rates, mainly linked to the instability of oil prices. Although, there is a steady growth of education in terms of quantitative measures, learners show inability of knowledge production or acquiring 21st century skills. It is important to underline the absence of strong relations between economic development and education in Arab countries and the need to rethink of both directions simultaneously. As pointed out by the International Labor Office (2020), youth unemployment is the highest in Northern Africa and in the Arab States, at around 2.2 and 1.7 times the global rate, respectively. In these two sub-regions, youth unemployment rates have been considerably higher than those in the rest of the world since at least 1991, suggesting that there are structural barriers stopping young people from engaging in the labor market.

Finally, we need to remember that the education of the population has two major objectives. The first one is instrumental, which consists of having a more productive and educated active generation. The second is related to the exercise of political rights and citizenry participation. However, younger generations in the Arab region do not have access to the status of an educated and socio-economic workforce, nor to the status of citizens enjoying political freedom and dignity. Hence, revolts broke out in certain Arab countries demanding that these two objectives should be achieved. Malik and Awadallah (2013) point out that young people are not only unemployed, but also unemployable. This problem persists despite the fact that public spending on education in the Arab world is higher than or comparable to that in other regions of the world.

It is unlikely to address any aspect of education and educational policy in the Arab region without due attention to the fact that the crisis of education is also in many ways a crisis of the development and the state, of which the utter instability—political and economic—are the major two manifestations. There is hardly any Arab society across the region in which the state is not—in many ways—on the defensive, fragile if not already collapsed (Mazawi, 1999).

Introduction

As we head into the second quarter of the 21st century, Sub-Saharan Africa continues to encounter a myriad of issues relating to its development and the future of its peoples. Of enduring significance are matters relating to the provision of formal education in the region, particularly those concerning access, inclusion, relevance and quality. These issues are of course not new. A close look at the history of the development and consolidation of formal education as an endeavor of significance should reveal that its provision in Sub-Saharan Africa has always been associated with questions about who provides, who participates, at what cost, for whose benefit, of what relevance and of what quality. Fundamental, as they are, these questions trigger further questions about the modes of thinking that have informed the strategic choices made and approaches adopted to the provision of formal education in Sub-Saharan Africa from its early beginnings in the Colonial era. It is of interest that much the same questions are being asked now that Sub-Saharan Africa is comprised of modern independent nation states as when it was a collection of colonial territories owned and overseen by the major European powers.

Tracing the journey over time, this paper aims to identify and review the key actors of educational activity in Sub-Saharan Africa. It also seeks to understand their overriding objectives, primary considerations and overall aspirations, and the role(s) these play in how the enactment of formal education in the region has been both approached and prosecuted.

The paper assumes however that though the questions asked about educational provision in Sub-Saharan Africa may not have changed, the national development needs of the politically independent countries that now make up the region should constitute the guiding intelligence that informs the provision, enactment, and ongoing reform of education in the region. This paper will assess the soundness of this assumption. In addition, it will seek to reflect the objectives, considerations and aspirations of educational endeavor and its reforms over time through a lens that sees education as critical to addressing the workforce, citizenship and leadership needs of the relatively young independent countries that make up the region.

Given what appears to be the proverbial chicken and egg relationship that exists between the quality of education (measured by literacy rates, student achievements etc.) and the level of a country's development, it is important to acknowledge at the outset that in Sub-Saharan Africa we are dealing with countries that are routinely classified as low and lower-middle income economies and, therefore, developing if not under-developed. For a provision that is generally acknowledged as a fundamental human right, education is not cheap. This fact constitutes an ongoing challenge for countries in the region. The experts associated with a recent Global Education Monitoring Report point out the following:

Children are more at risk, especially in sub-Saharan Africa, where extreme poverty affects 49% of children, accounting for 52% of extremely poor children globally Education is an opportunity with the potential to transform lives. Yet an estimated 258 million children, adolescents and youth, or 17% of the global total, are not in school. The number out of school in sub-Saharan Africa has passed that of Central and Southern Asia and is growing. The share of sub-Saharan Africa in the global total increased from 24% in 2000 to 38% in 2018.

Global Education Monitoring Report Summary (2020, pp. 6–7).

Against this sobering context, it is important to note moreover the reality that: "Large differences in education spending as a share of GDP between low-income and high-income countries are not due to differences in the priority accorded to education in government budgets but due to differences in the share of overall government spending in GDP" (Al-Samarrai et al., 2021, p. 7). Essentially, it seems, actual spending on education in Sub-Saharan Africa is dictated more by the size of GDP than by the value placed on it as a developmental need. With a capacity to provide so compromised, it is important to ask what the real forces are that drive educational activity in Sub-Saharan Africa, the dominant motivations at play, and the prospects and challenges that arise for countries in the region as a result. This paper, aims to engage with and, hopefully, shed some light on these questions.

Still, and before proceeding any further, there is no intention, as might appear to be the case so far, to characterize Sub-Saharan Africa as a homogenous undifferentiated space. Indeed, to highlight its diversity and the many ways by which often undifferentiated educational approaches and policies manifest at local, community and national levels, the paper will routinely illustrate its claims by pressing into service examples from individual countries as relevant, including, Ghana, Nigeria, Tanzania, South Africa and Rwanda. It will moreover focus predominantly on the K-12 sector in Africa. Still, the issues highlighted may well also be applicable, to various extents, to the story of higher education in Sub-Saharan Africa.

Colonialism and its ambivalent legacies

A common historical experience shared by the countries of the vast geographical territory, now labeled Sub-Saharan Africa, is that of colonialism. With the exception of Ethiopia, much of Sub-Saharan Africa was colonized by the powers of 19th Century Europe, notably Belgium, France, Germany, Great Britain and Portugal. Still, it is to the Christian churches and their missionaries that introduction of European style education in the region can be credited. As Becker (2021: n.p.) notes, “Mission societies often expanded into territories before colonial powers did”; further, they “continued to be the main providers of education even after colonial powers established control during the so-called Scramble for Africa which occurred between 1884 and 1914”. The schools set up by the missionaries facilitated their work by training interpreters who supported their evangelism and helped gain new converts through various networks of schools. The education provided through these mission schools also “spread Eurocentric norms” many of which, for good or ill, remain visible even today in the lived culture of many Sub-Saharan countries. This however is only the story of *European style* education in Sub-Saharan Africa.

Often forgotten, or neglected, is the fact that as far back as the 11th century the Arab-Berber merchants had also brought *Arab-Islamic education* to West Africa. It was “subsequently spread by [Islamic] religious brotherhoods in the 19th century” (d’Aiglepiere et al., 2018: n.p.). The European colonial authorities saw the Koranic schools of the Islamic tradition as a force to contend with and created their own schools to train competent civil servants’ (d’Aiglepiere et al., 2018), familiar with western norms and Christian ethos. The Islamic madrasas however have continued to exist throughout the Sub-Saharan region. It is important to recognize this alternative source of formal education in Sub-Saharan Africa and its present-day manifestations if we are to have a fuller understanding of how the contemporary educational landscape in Sub-Saharan Africa is constituted. As well, an acknowledgment of Arab-Islamic education in the region has implications for how we understand the complexities of access and inclusion in the region. This is a matter of relevance to the aspirations of the *education for all* agenda. d’Aiglepiere et al. rightly note that:

Arab-Islamic education in general, and Koranic schools in particular, are largely excluded from programs advocating education for all in Africa. Yet this education concerns a large number of children, many of whom are considered as “out of school” by the most public authorities in Africa, as well as the various international development agencies. According to d’Aiglepiere et al. (2018), however, recognizing their existence and importance, as well as their diversity, is a prerequisite for building a dialog between all stakeholders about the challenges of education reform in the Sub-Saharan Africa.

Additionally, this corrective is useful as it takes us beyond some of the more common clichés that, typically, diminish the presence and role of Arab-Islamic education in the region, including rather popular misperceptions about it as: a recent phenomenon in Sub-Saharan Africa; a negligible phenomenon in Sub-Saharan Africa; being only for boys and for the poor; and concerned only with memorizing the Koran. While Islam, Christianity and their religious pursuits can be said to account for the advent of formal¹ education in Sub-Saharan Africa, there is no denying the role played by colonial governments following the Scramble for Africa. Much has been made of the role of education in colonialism’s “civilizing mission” in Sub-Saharan Africa and of the duty that the “superior races” have to “civilize the less fortunate, ‘inferior races’” (Serequeberhan cited in Mart, 2011, p. 1). Neither time nor space permit detailed elaboration of the whys and wherefores of these claims. Still, the question must be asked as to whose interests were served by the advent and consolidation of formal education in pre-colonial and colonial Sub-Saharan Africa.

Boiled to its essence, the historical evidence points to the complicity of religious missionaries in Europe’s project of colonization in Sub-Saharan Africa. The introduction of Eurocentric norms and values clearly aided the colonial project by nurturing an inadequate sense of self among the African populations who came to believe in their own inferiority to their European counterparts (Fanon, 1967). Furthermore, the colonial governments used education as a tool to train Africans for colonialism’s own purposes, namely, administration of colonial territories in the interests of the colonizers, as was clear with Lord Lugard’s ‘policy of indirect rule’ (Scott, 2013, p. 2). Such policies promoted the “modernization for colonized people” but served the purpose of creating a pool of skilled but cheap labor. It led to cultural alienations that entrenched notions of racial inferiority among Africans while also disrupting existing social structures and establishing new hierarchies in African societies.

Across present day Sub-Saharan Africa, the ambivalent legacies of the colonial purposes and impact of formal education remain very much in evidence—these often manifest in issues that challenge the internal cohesion of countries in the region as modern nation states. The most readily visible legacy, in this context, are languages of colonial domination now elevated to the status of

¹Some commentators present Arabic-Islam education as informal. This would seem to be because it is often considered to be purely religious in focus—a contestable perception.

official languages of Sub-Saharan Africa. English, French, Portuguese continue to function as languages of instruction in the educational systems of the region and play a critical role in the social mobility of its citizens (Okolo, 2005). It is widely argued (Wolff, 2018) that these languages, owing to their prime position in administration of the modern independent nations, are best placed to provide a shared language of communication across different clans, tribes and kingdoms of each country and internationally. Such an approach to the language of instruction is viewed as essential to nation building in a context of different languages, dialects and cultures each vying for prominence. The sober reality is that in the elevation of Europe's languages, the African languages are effectively silenced and rendered inferior. Consequently, those without access to English, French, Portuguese are also excluded from opportunity and social mobility in the context of the modern state.

The role of education in national development

Assuming it to be a powerful force for economic and social development, it is not surprising that all nations—rich and poor alike—commit to investing significant proportions of their revenues to the education of their people. This is consistent with the other widely held view that any nation's most important resource is its people, a notion made even more popular by Barack Obama in his Yangon University speech of 2012. While Sub-Saharan Africa is consistently described as a region rich in natural resources such as oil, coltan, lithium and a wide variety of other valuable minerals both renewable and non-renewable, it is equally maintained that harnessing of these resources for national development requires a knowledgeable and skilled workforce. There is no overstating the important role education plays in the development of such a workforce. This is even more so, given the relatively recent arrival of Sub-Saharan African countries to the status of independent nationhood with the presumed capacity to determine their own directions for development and to manage their own affairs.

As already noted, however, formal education in colonial Sub-Saharan Africa seldom served the interests of the colonized. More than anything the training and orientations it provided to local populations simply facilitated the carting off of the region's significant natural wealth to serve the material enrichment of Europe. That this exploitative arrangement worked to the detriment of the region's own development is evident in the generally inadequate, if not altogether non-existent, infrastructure for socio-economic development in the several countries of the region at their respective attainments of political independence. This includes the poor levels of human resource development. On independence, it might be noted that countries such as Ghana, Tanzania and Kenya inherited very low literacy rates, together with a low number of trained doctors, engineers, lawyers, teachers, nurses, tradesmen. Not surprisingly therefore, commentators such as Austin (2010) have noted that political independence for these countries did not come with economic independence. Significantly, with hardly any exceptions, the erstwhile colonial powers, especially the United Kingdom and France, maintained their controlling involvement in the management of the region's natural wealth. In a more nuanced analysis than this cursory survey can give justice to, Austin (2010) acknowledges severally that "the French government remained closely involved with its former colonies after their independence, not least through the franc zone." Citing Uche (2008), Austin further acknowledges that "... the British government's attitude to the Biafran secession was influenced by the interests of British oil companies." As a result, these resource rich countries were reduced to mere raw material producers with little influence in determining the value of their own wealth. In more recent decades, this situation has been made worse with the emergence of a globalized world economy that allows economic power to be retained by capital and its owners. This is a context in which enables China, now a major economic player, to extract Africa's raw materials to feed its own industrial manufacturing interests with little change to the region's status as a generally powerless raw material source.

The upshot is that despite all their natural wealth, the preponderance of Sub-Saharan African countries remains poor and unable to afford the cost of educating their own peoples to provide the workforce, citizenship and leadership skills that will advance their own national development interests. This vicious cycle of poverty diminishes the political agency of the Sub-Saharan countries, leaving their development aspirations at the mercy of external funding or donor agencies whose interests are not necessarily convergent, if not altogether at odds, with theirs. It is a poverty that generates dissatisfactions and disillusionments with the promise of independence. It is not unheard of for sections of the disappointed populations in these countries to express a desire to return to the relative 'comforts' of colonial rule (Moro, 1989 cited in Ayittey, 2006). The unfulfilled aspiration among the various sectors of the populace results, ultimately, in the political instability of coups d'états for which Sub-Saharan Africa has something of a reputation.

The revolving door of political leadership further undercuts the prospects of economic development for countries in the region as they are taken hostage by successive groups of military adventurists and their ilk, mostly ill-suited to national leadership and without the skills to match their ambition. Examples from the DRC, the Gambia and Burkina Faso indicate extreme versions of this phenomenon (Suleiman and Onapajo, 2022). Their inevitable setting back of the economic development aspirations, contributes in no small way to exacerbating the challenges of providing the education necessary for the economic uplift of the nation and the upward mobility of its citizenry.

Clearly, for the several countries of Sub-Saharan Africa, the historically long arm of colonialism continues to cast a grave impoverishing shadow which weakens their very viability as independent nations that possess the agency to determine and manage their own affairs. Sub-Saharan African nations have the most need to educate their own peoples for the purposes of harnessing their considerable natural resources for national development. And yet, they find themselves, unwittingly and helplessly, assisting the economic expansion of the very countries whose wealth constitute the resource base of the international finance institutions to which they must go begging for aid, such as the International Monetary Fund and the World Bank. A lamentable irony.

The aid sought and received from international organizations (IOs) routinely comes with ideological strings that shape the approach to education reform in directions that are not always of the choosing nor necessarily in the interests of the Sub-Saharan African countries themselves. The donor organizations and countries have their own interests and perspectives which define their understanding of the educational reforms needed in the countries of the Sub-Saharan Africa. Invariably IOs seek to marry the locally articulated requirements with their own preferences. This can be illustrated by examining the contrasting agendas of educational reform promoted by UNESCO and the World Bank.

Contrasting goals of the World Bank and UNESCO

Most countries in Sub-Saharan Africa gained independence from colonial rule during the 1960s–70s. Political independence, for these countries, was the first rung on the ladder to nation building and national prosperity. Eager to improve life and living for their respective peoples, the governments of these countries embarked on a broad range of national development initiatives to achieve economic self-sufficiency and affirmation of national identity. Typically, these initiatives were ambitious in scale, span of focus and speed, especially for countries whose populations were relatively small, their institutions in the formative stages of development and their sense of nationhood only incipient. Still those heady days of development saw significant investments in building the infrastructure for national development, including education. The example of Tanzania, where “public spending on education rose during most of the 1970s, reaching a high of about 6% of GDP in 1979” (Gerard et al., 1998) cited in [Johnson \(2002\)](#) is a case in point.

Unfortunately, such expanded investment in nation building through education came to an untimely end in the 1980s. The collective bite of the OPEC oil crises of the late 1970s, followed by the global recession of the 1980s and the financial toll of an ambitious national development drive ushered in a period of declining investments. Of Tanzania, Gerard et al. (1998, cited in [Johnson \(2002:n.p.\)](#), note that, “The share of budgetary contributions to education fell just over 4% in the early 1980s, and then dropped to below 4% by the early 1990s”, along with “other spheres of social endeavors were also dramatically affected under the impact of fiscal retrenchment.”

Across the region, governments sought the support of the World Bank and IMF to revitalize economies suffering a similar fate as Tanzania’s. Their response, the Structural Adjustment Program ([Heidhues and Obare, 2011](#)) of the 1980s, deserves comment. In order to ensure debt repayment and efficient restructuring of economies in distress, the banks imposed “conditionalities” in return for financial assistance. A key characteristic of these “conditionalities” included the requirement for governments to reduce public expenditure on the very activities that would advance economic growth and raise the standards of living for their peoples—these included:

- cuts to government expenditure on essential nation building activity like education, health and development—effectively this requirement placed stifling limits on state participation in activity to grow their economies
- encouragement of privatization in the provision of development infrastructure including, critically, education and health
- removal of protections for domestic industries so as to attract foreign investors
- increased exports of raw materials to support debt repayments and stabilize local currencies

The negative impact of these policies on the economies of Sub-Saharan African countries, and the extreme hardships they created for daily living have been well-documented ([Konadu-Agyemang, 2002](#)). In education, the reductions in government expenditure had dire consequences for provision of educational infrastructure (schools, textbooks and other learning resources), teacher development and the opportunities to expand access—a perfect combination of factors that ultimately served to divest education in Sub-Saharan Africa of any semblance of quality, a situation that continues to endure in many of the countries affected. As well, in countries like Tanzania, the government was compelled to reintroduce school fees (cost sharing)—earlier abolished to stimulate broader participation in the immediate post-independence years—with predictable consequences ([Brock-Utne, 2013](#)).

Private sector participation, intended to make up the shortfall in government provision, generally operated on a commercial basis. The costs involved in participation added to household costs in a time of financial hardship and parents/guardians had to make choices. This led to the exclusion of families without the means; it also tended to exclude girls, orphans and other children of school going age whose participation in education parents felt to be unnecessary or not worth the investment. [Pamba \(2012\)](#) notes that in countries like Burkina Faso, Burundi, Angola and Kenya and elsewhere, the policy of cost sharing had an adverse impact on enrollments with the number of children out of school increasing markedly in the period between 1980 and 1997.

In a world where education is widely held to be a fundamental human right ([Task Force on Higher Education and Society, 2000](#)), one can only wonder at the human sensitivity of policies that overtly, and some might say gratuitously, undermine this right for the poorest of the world. Article 26.1 of the Universal Declaration of Human Rights states without equivocation that “Everyone has the right to education. Education shall be free, at least in the elementary and fundamental stages” ([United Nations, 1948](#)). Did the whole world turn a wilful blind eye to these statements while the International Financial Institutions (IFIs) brazenly put a cost on education via their SAPs and, thereby, commodified it without warning, to the exclusion of large swathes of children from Sub-Saharan Africa?

It is important to note that with their insistence on SAPs and attendant conditionalities, the IFIs, including the IMF and the World Bank, arrogated to themselves decision making authority for shaping macro-economic policy in those countries unfortunate enough to request their financial assistance. As [Pamba \(2012\)](#) argues, “It was not long before the World Bank begun playing an

active role in guiding macroeconomic development in recipient and even applicant countries in the direction it considered appropriate” (pp. 19–20). Of significance, the World Development Report (World Bank, 2000) indicated that the World Bank committed some USD1.8 billion, to the education programmes in the world’s poorest countries between 1991 and 1999. This constituted 8.2% of its overall lending for the period, almost double the 4.8% it allocated to education in the 1980s. However, most of the increased lending for education was committed to recurrent expenditure—salaries, teaching and learning supplies and the like—at the expense of development expenditure. In, Kenya, for example, recurrent expenditure accounted for 95% of total education expenditure with development expenditure making up only 5% of same over the 2002/3 to 2004/5 school years (Pamba, 2012). The curtailed investment in development expenditure had negative consequences for access, teacher recruitment and training, and infrastructure developments.

The absence of a concern for social values in the conception and implementation of the neoliberal SAP is perhaps best underscored by the extent of physical violence and death its resistance led to, as students and teachers protested the cuts to educational funding. In country after country these protests, in the form of demonstrations and teacher strikes resulted in actual loss of human life. From Benin, through Niger to Nigeria, Uganda and the Democratic Republic of Congo, cuts to government funding for education in the 1990s led variously to the attenuation of educational programs, withdrawal of study grants for students and teachers alike, salary reductions and redundancies, deterioration of school facilities and learning equipment.

The ensuing protests, especially by students and lecturers in the tertiary sector resulted in expulsions, arrests and incarcerations, violent deaths, long school boycotts and closures. In her research on the subject, Pamba (2012) details the armed assaults unleashed on students of the Ahmadu Bello University (ABU) in Zaria, Nigeria who “were massacred by security forces after staging peaceful protests over impending introduction of SAPs” in 1986. In an equally violent manner, the Ugandan police “fired into a crowd of protesting students” of Makerere University—at least two students were killed on that occasion in December 1990.

Placed against the interventions of the IFIs, UNESCO’s aspirations, motivations, and approaches to education in Sub-Saharan Africa in contrast could not be more different. With a clear goal for *all* children to be participating in school by 2030, UNESCO’s *Education For All* agenda and Sustainable Development Goals explicitly have prioritized equity, access and inclusion. They have sought to grow the capacity of Sub-Saharan African countries to optimize opportunities for equipping their citizens with the competences for effective participation in nation building in a time of global volatility, uncertainty, complexity and ambiguity. Upfront and clear-eyed about the magnitude of the need, UNESCO acknowledges that:

Of all regions, sub-Saharan Africa has the highest rates of education exclusion. Over one-fifth of children between the ages of about 6 and 11 are out of school, followed by one-third of youth between the ages of about 12 and 14. According to UIS data, almost 60% of youth between the ages of about 15 and 17 are not in school. Without urgent action, the situation will likely get worse as the region faces a rising demand for education due to a still-growing school-age population.

UIS Factsheet No. 56 September (2019, p. 7).

In direct contrast to the IFIs, UNESCO seems focused on addressing, not creating or exacerbating, the problems of access traceable, in part at least, to the impact of SAPs in the Sub-Saharan Africa region. Whereas the IFIs are driven by economic imperatives rooted dispassionately in the workings of market forces, UNESCO is unequivocal in declaring that “Education in Africa is major priority for UNESCO and the UIS.” In pursuit of this priority, its Institute of Statistics (UIS) “Develops indicators to help governments, donors and UN partners better address the challenges.” These indicators focus, for example, on school’s access to basics, including access to electricity and potable water, classroom conditions—from the availability of textbooks to average class sizes. They also focus on data relating to teacher training, recruitment and working conditions (UNESCO-UIS, 2019). Of particular interest to UNESCO is Girls’ education—an aspect of education in Sub-Saharan Africa that was severely hampered by the regime of SAPs.

UNESCO’s approach to education in Sub-Saharan Africa is rooted in a commitment to inclusion as a moral imperative for a rapidly changing world that “faces constant major challenges—from technological disruption to climate change, conflict, the forced movement of people, intolerance and hate—which further widen inequalities and exert an impact for decades to come.” (UNESCO, 2020) Unapologetically, UNESCO embraces education as a fundamental human right for all, including, especially, the world’s most vulnerable and disadvantaged in Sub-Saharan Africa. As its Director General, asserts in her foreword to the *Global Education Monitoring Report (2020)* with the telling theme “Inclusion and Education: All means all”, “More than ever, we have a collective responsibility to support the most vulnerable and disadvantaged, helping to reduce long-lasting societal breaches that threaten our shared humanity.”

Emergence of private corporate and philanthropic actors in education

Attempts to reform education in the countries of Sub-Saharan Africa thus take place within this contradictory space, with the international financial institutions, UNESCO and other United Nations agencies with a responsibility for education, such as UNICEF, pulling them in conflicting directions. These international organizations are however not the only players. The region’s very conditions of disadvantage and inadequacy as regards educational infrastructure, facilities, resources, and the qualified personnel, to

support access and high-quality outcomes for all, appear to have made sub-Saharan education an object interest for a variety of non-governmental players.

Noted already has been the roles played in education by the Christian church and Islam in pre-colonial and colonial times. Both have maintained their interest and presence in the post-colonial era, too, and continue to support promote their own distinctive approach to educational reform in present day Sub-Saharan Africa. Schools belonging to or closely associated with the various denominations—Catholic, Methodist, Anglican, Presbyterians, Baptist, T I Ahmadiyya—remain very visible on the sub-Saharan educational landscape.

Alongside the religious groups, philanthropic organizations such as the Aga Khan Development Network (AKDN) and SOS Kinderdorf International have also had a long involvement in bringing education of various countries within the region. The AKDN has a strong presence especially in East Africa (Kenya, Madagascar, Mozambique, Rwanda, Tanzania, Uganda) and West Africa (Burkina Faso, Cote d'Ivoire, Mali, Senegal) where it supports the education of children, the youth and adults (AKDN; n.d.). SOS Kinderdorf International operates in 46 African countries (SOS Children's Villages; n.d.). Like the AKDN, it also supports the education and training of disadvantaged children and youth by providing access to traditional K-12 education as well as vocational training, apprenticeships and work experience.

As philanthropic organizations both of these organizations seek to augment the work of governments in making fee-free education accessible to as many as their own resources and resourcefulness makes possible. They can be said to be partners of governments within the region in this regard as early adopters and implementors of the UN's SDG 4 on quality education (see <https://www.akdn.org/gallery/sustainable-development-goals-partnerships-goals>). Notable recent arrivals on the terrain of philanthropic educational endeavor in Sub-Saharan Africa include the African Leadership Academy (ALA), which currently located in South Africa, Mauritius and Rwanda, is dedicated to the cause of developing the next generation of African leaders through programs that emphasize entrepreneurship. Another active a philanthropic organization is Still I Rise, which seeking to make a high-quality education available to children who live in Mathare, a slum in Nairobi, Kenya. An additional, and miscellaneous, group of actors can also be found in the several so-called "International Schools" often run through partnerships between host countries and others to support education for the children of expatriates, diplomats and relatively affluent local elite. For example, the United World College International now has a school in Swaziland and another in Tanzania.

Over the past two decades, though, some new non-governmental players have emerged from the global corporate world alongside a motley crew of small local actors, who work individually or in partnership with others across the region, to take advantage of the opportunities for entrepreneurship presented by the deficiencies of education within the region. Some of the names and organizations of interest in this regard would be Pearson (and its local franchisees in Sierra Leone and Ghana), the Enko Group which describes itself as "a fast-growing network of African international schools, increasing access to the world's best universities for learners across Africa"—supported by several international financing institutions, including Proparco, I&P, Oiko Credit, Liquid Africa and BIO, Enko Education currently operates in Senegal, Côte d'Ivoire, Cameroon, Mali, Burkina Faso, Mozambique, Botswana, Zambia and South Africa, and aims to open 50 more schools over time.

This group of non-governmental educational players operate a for profit fee-paying model of education across the income spectrum with the global corporate, Pearson, for example, targets the lower end, the "bottom of the pyramid" "among the poorest the fastest growing market" with "collective 'untapped buying power' ... by providing services to the poorest, businesses are not only making profit, but at the same time doing good! Indeed, this is the argument of 'philanthrocapitalism'" (Prahalad, 2004) cited in Lingard (2015).

Working in partnerships, Pearson claims a commitment to supporting the educational needs of the underprivileged in Sub-Saharan Africa. According to Kate James, Chief Corporate Affairs and Global Marketing Officer at Pearson:

In large parts of Africa, upwards of 40% of children are living in poverty and not receiving an education or gaining the crucial skills needed to get a job. Together with Camfed we're determined to play a role in helping improve the life prospects and career opportunities for young people in Africa – with a particular focus on empowering young girls.

Pearson (2017).

Camfed CEO, Lucy Lake says that, "Our partnership with Pearson has opened up opportunities among some of the most marginalized young people around the world ..."

While Pearson's declared intent is laudable, it has drawn significant criticism owing to questions about its actual mode of operation. Pearson's critics complain about education of a questionable quality as the very low level of remunerations it offers means that it uses unqualified Learner Guides, in place of qualified teachers, to deliver pre-packaged mass-produced curriculum. In an era of increasing sophistication in personalized learning and differentiated instruction techniques, such a strategy is incapable of catering to the reality of diversity as regards student learning needs. Commenting on the contradictions of Pearson's edu-business activities globally, Lingard (2015, n.p.) notes:

Pearson proffer strong support for the 'quality teachers' agenda in the nations of the Global North (see, for example, Pearson's series of publications, *Open Ideas* and in particular John Hattie's two 2015 pieces), but their support for low-fee private schools that will generate profit is economically dependent upon the employment of un- and under-qualified and very lowly paid, non-union organised teachers often using scripted pedagogies. There

is a stark moral contradiction here. It becomes apparent that the bottom-line is profit, rather than social good.

In addition to these contradictions relating to teacher quality, pedagogy and remunerations, Lingard (2015, n.p.) also identifies contradictions relating to the “low-fees” charged by Pearson and its partners. In his view, in contexts of predominantly low incomes, school fees, however low, are still a significant expenditure for families and leads to exclusion of the culturally disadvantaged. In this constituency would belong girls, the disabled, orphans, and the like, for whom formal education is often seen by parents and guardians as an investment of limited benefit. Lingard also notes that Pearson’s concept of “low fee” schooling both challenges and undermines “the notion that ‘free’, high quality public education for all is central to democracy and a socially just society and concerningly there is little evidence to support the effectiveness of low-fee, for-profit schools” (Lingard, 2015, n.p.).

Current challenges

The contemporary challenges facing education in Sub-Saharan Africa are arguably located within a history of failed attempts driven by ideological interests that often undermined Africa’s distinctive cultural and political interests. The histories formal European (Western) and Arab (Islamic) persist in the region but are now rooted in a new set of conditions emanating from philanthropic and corporate organizations that espouse a language of reform but often pursue their own interests. Within the context of the reality of limited government funding relative to need, the challenges which at educational systems in sub-Saharan Africa continue to face relate to access and participation, especially of girls and of children disadvantaged by poverty and various forms of disability; inadequacy of basic infrastructure for education in the region and the limited availability of essential resources, facilities and equipment—these cover the range from physical classrooms, stationery, textbooks, laboratory equipment to teacher supply and teacher/leadership training; and the nature (i.e., focus and content) of education as enacted, its relevance and responsiveness to the needs of students and to the needs of the communities (local, national, regional, global) in which they will likely operate.

It is instructive to acknowledge that these challenges persist despite evidence of recent increases in the proportion of expenditure on education, relative to other sectors of the economy, by governments across the region. From a relative low of 15.88% in 2016, government expenditure on education (current, capital, and transfers) ... expressed as a percentage of total general government expenditure on all sectors (including health, education, social services, etc.) has seen a steady increase resulting in 17.88% in 2018 (World Bank Macrotrends, 2022). It is important to note however that these increases, however modest, are occurring against a backdrop of persistent balance of payments deficits for the majority of countries in the region, and mark clear commitment by their governments to address the unfortunate phenomenon that some commentators label “education poverty”.

That access and participation remain a seemingly intractable challenge is underscored by the data available from the UNESCO Institute for Statistics (UIS) from which we learn that:

Of all regions, sub-Saharan Africa has the highest rates of education exclusion. Over one-fifth of children between the ages of about 6 and 11 are out of school, followed by one-third of youth between the ages of about 12 and 14. According to UIS data, almost 60% of youth between the ages of about 15 and 17 are not in school (UIS UNESCO, 2019, p. 1).

Scrutinizing these sobering figures closely, Mogoatlhe (2020, n.p.) reminds us that the situation is “particularly grim for girls. 9 million girls in Sub-Saharan Africa, aged between six and 11, will never set foot in school.” She also notes that “23% of girls are out of primary school, compared to 19% of boys.” And yet, countries in the region have and continue to initiate and implement strategies, by themselves and in collaboration with other countries and/or agencies to work toward the ideal of education for all.

Noting the difficulties posed to access by school fees, previously discussed, a country like Ghana instituted the Free Compulsory Universal Basic Education (FCUBE) program aimed at ensuring equal and free access to basic education for all Ghanaian children. This program operated between 1995 and 2005. Not surprisingly, the expanded access to basic education—covering 2 years of Kindergarten, 6 years of Primary and 3 years of Junior Secondary—created a need for similar expansion at the Senior Secondary and Tertiary levels. The government of Ghana responded, in 2017, with a fee free education for students in Senior Secondary. Ambitious and well-intentioned as such initiatives are, they are not problem-free. Again, the Ghanaian example is instructive as the expansion in student numbers is not always met with commensurable expansions in learning spaces (physical school blocks/classrooms), teacher supply, teaching and learning resources.

Of interest, the recent move to a fee-free education for students in Ghana’s Senior Secondary system has had to be accompanied by the introduction of a double-track² system of schooling to cope with the significant numbers of students taking up Senior Secondary education—a surge from 306,000 students in 2016 to 430,000 in 2018 (Kerr, 2020). This arrangement has had implications for continuity and quality of learning. Briefly, while the access agenda is progressively being met, that of quality, if the critics are to be believed, is progressively deteriorating.

The Ghanaian example makes clear that access is dependent on adequate infrastructure—a fee-free policy without the requisite number of learning spaces, well-qualified teachers and learning materials to cope with the increased numbers of students hampers

²The double track is a shift system of schooling that uses the same facilities to provide for two different student cohorts. In the Ghanaian system, the cohorts alternated their occupancy of the school space such that while one was in session, the other was on a break. This resulted in adjustments to the school year with each cohort spending a significantly shorter period of time at school when it was in session.

both access and quality. Abolishing school fees is not enough—this is a point worthy of emphasis as the Ghanaian example (dubbed Free SHS) took a very comprehensive approach to “free” which extended beyond school fees to uniforms, textbooks, feeding and all costs relating to boarding and lodging for students admitted to boarding schools. It is remarkable, therefore, that anecdotes abound, in Ghana, of parents asking to be allowed to pay fees if that would ensure that their children/wards did not have to participate in the double track system.

According to [Kerr \(2020\)](#), “Currently, 17 governments, representing 37% of Sub-Saharan African (SSA) countries, offer some form of fee-free lower and/or upper secondary education.” While these policies vary in their conception and implementation across countries it is clear that governments across the region are reckoning seriously with the impediment that a regime of school fees poses to participation in education especially by the disadvantaged. As the report notes, in many cases there are hidden costs to what is held up as “free education”, as parents/guardians have to finance the costs of textbooks, uniforms, feeding and the like.

Even in Ghana, where the government pays for all formal costs associated with the Free SHS, ambitious parents are quick to point out that they are spending more of their own money than previously to provide private tuition for their children—this is a complaint that goes to the heart of the quality debate. These hidden costs are no less an impediment to participation especially for girls and children from disadvantaged backgrounds. Enhancing access and participation for girls continues to be a matter of complexity as factors like the lack of access to basic toilet facilities and adolescent hygiene products at school combine with cultural expectations of early marriage, childbirth, farm labor in rural settings to keep girls away from school. Fortunately, the latter are on the decline.

The disruptions wrought on the world of education by the Covid-19 pandemic have thrown into sharp relief the inadequacies of school infrastructure across the region. In many countries of the region, education effectively came to a halt for students as the infrastructure of digital technology did not exist to support the shifts to online learning that were initiated and consolidated in other parts of the world. Even where some form of online learning was made available neither teachers nor students had the knowledge and facilities necessary for effective participation in teaching and learning. In some parts of Kenya, some lessons were made available to students via radio networks. Children from families without a radio could not participate.

As Human Rights Watch reports, “Many children received no education after schools closed across the continent in March 2020” ([Human Rights Watch, 2020](#); n.p.). In the presentation to their *35th Ordinary Session of the African Committee of Experts on the Rights and Welfare of the Child* they demonstrated in very vivid terms the ways in which “school closures caused by the pandemic exacerbated previously existing inequalities, and that children who were already most at risk of being excluded from a quality education have been most affected.”

Covid-19 aside, however, the issue of educational infrastructure, or lack thereof, has underlined a long-standing challenge in the region. Reference has already been made to the adoption of a double track system in Ghana as a strategy to cope with the surge in student numbers at the introduction of the Free SHS. The region does not have enough schools or classrooms for its students. UNESCO’s Institute for statistics identifies “poor infrastructure” as a critical barrier to education ([UIS UNESCO, 2016](#), Slide 4). It is not unusual for children in urban centers to have overcrowded classrooms relative to the physical size of the class or to attend schools that lack the basics such as a board for each class, or toilet facilities or clean water or electricity or adequate textbooks and stationery. Similarly, it is not unusual for children in country towns or rural villages to have to walk long hazardous journeys, daily, to a school or attend classes in dilapidated buildings or under trees.

If a school’s most important resource is its teachers, then this is an area of significant challenge in the region owing to problems of supply. As government policies and actions lead to expansion of access to education for all children in the region, more teachers will continue to be needed. However, as a relatively poorly paid profession in the region, teaching does not attract many takers or stayers and there is, thus, a high attrition rate. Against such low take up and high attrition—from retirements, resignations, emigrations, mortality—the demand for teachers, has always outstripped supply. Historically, countries in the region have made do with significant numbers of “pupil teachers” and university graduates without teaching qualifications but this was before the policies and programs to make education free and accessible to all children of school going age. For example, “In Lesotho a 2007 study found that 40% of primary teachers were unqualified (Education International, 2007). In the same year there were 40,000 qualified teachers unemployed in Kenya, and a further 15,000 unemployed in Zambia (Education International, 2007)” ([UNESCO, 2010](#), p. 1).

These figures suggest a general dissatisfaction within the region with teaching as a worthwhile profession. Challenges of remuneration, retention, ongoing professional learning, career progress and fulfillment loom large alongside those of training and recruitment. Any attempt to narrow the gap between demand and supply of teachers must seek to address these challenges as a matter, also, of addressing the quality of teaching and learning. In Ghana, for example, the number of teacher training institutions, known as Colleges of Education (CoE) is on the rise—Isaac [Buabeng et al. \(2020\)](#) note that, from 38 CoEs in 2014, the number now stands at 48 CoEs. The increase is a result of deliberate government intervention which resulted in the absorption of “10 private CoEs with the aim of expanding the infrastructural facilities in the colleges” (p. 87) Typically, the CoEs offer three-year Diploma in Basic Education (DBE) programmes. Alongside the CoEs, the University of Cape Coast and the University of Education, Winneba, well-known as traditional teacher education institutions run programmes leading to academic degrees in Education ([Buabeng et al., 2020](#)). Beyond initial training and certification, however, there seems to be very little effort on the part of governments in the region to tackle the needs of ongoing teacher professional development beyond massive subject focused teacher workshops to introduce new or revised curriculum as necessary.

The challenges highlighted in this discussion, while important in themselves, are also of significance because of the adverse impact they stand to have on the overall quality of education in the region. Even as literacy rates increase with the efforts to expand

educational access, it is of concern that the quality of education on offer does not result in outcomes that meet minimum standards globally. Mogoatlhe (2020) tells us that “90% of children aged between 6 and 14 ... won’t reach the minimum reading requirements even after they complete secondary education.” This telling statistic underscores Mogoatlhe’s assertion that “it’s also not enough to just be in school—the quality of the education also has to be good for a child to thrive.”

However, I would argue that the quality of education for a region as distinctive as Sub-Saharan Africa, should be determined by a more comprehensive set of performance markers than are currently available from reliance on student achievement on standardized testing. Proceeding by questioning in the concluding segment of this paper, it is important to note the need to approach the issue of quality from the standpoints of both curriculum content and pedagogy, together with the recognition that Sub-Saharan African countries are among the poorest of the world (Mogoatlhe, 2020) and lack the resources to invest heavily in education. Against this recognition, a significant regional and national objective for education must not only be a focus on educational outcomes but also the alleviation of poverty.

Conclusion

The discussion in this chapter has highlighted the continuing challenges that systems of education face in Sub-Saharan education. The challenges are not only a product of historical legacies but also the current pressures, economic, political and cultural. Various international organizations have attempted to help but have not been able to align their interests with those of Sub-Saharan Africa. May reform attempts have failed, while others lack conditions of sustainability and suitability. The criteria by which the quality of education in the region should be assessed continue to be contested. Ultimately however these criteria need to consider the following questions more seriously and critically:

- To what extent does the content of curriculum in the region align with the needs of national development for its various countries?
- What importance is given to the languages and cultures of the region in the education of its children?
- Are the ways of knowing and being in the region acknowledged and valorized in the curriculum?
- To what extent does teaching and learning routinely connect students to the wealth of their own cultural contexts as resources for learning?
- To what extent does the local community participate in the teaching and learning process?
- How does teaching and learning provide opportunities for schools and students to collaborate with community (local, national, or regional) to solve/address problems of interest?
- How does teaching and learning harness technology to provide experiences that support the learning needs of each student and, thereby, enhance the development and consolidation of desired competences?
- To what extent and how effectively do teachers actively collaborate with their peers, students and their parents in the pursuit of effective praxis as lifelong learners?

These questions should, hopefully, provoke reflection on the nature of education appropriate to the needs of the region. In many ways they reflect standards and practices to be aspired toward if the quality of education in Sub-Saharan Africa is to improve in the ways that address the needs of national development and poverty alleviation while also affirming the cultural identity of students and supporting their holistic development. They also point to the need for the curriculum and its teaching to be decolonized through engagement in culturally relevant, responsive and sustaining practices. As well, they nudge into consciousness the levels of professionalism and professional practice that teachers in the region should be aspiring toward.

Taken together, the questions return us to the purposes of education for the Sub-Saharan African region. They also offer a perspective on what the experience of learning should be for students, teachers, schools and the communities that host and, in many ways, sponsor them. Implicit is the consideration of whether an education rooted in the resources (and daily challenges) of the community might prove to be more accessible and engaging to all, regardless of financial standing? Might it also engender modes of problem solving that serve to create new knowledge for sharing with others? But perhaps, we are getting ahead of ourselves. There is yet much work for the region’s governments and stakeholders in education to do to realize the possibilities of quality education envisaged here. Sadly, too much of the leadership of educational reform is currently ceded to the region’s development partners. The governments of the region need to step fully into this role as a matter of urgency.

Introduction

Since the 1980s, the educational systems of Latin America underwent analogous shifts despite significant disparities between countries. Education became an artifact to join globalization from being a lever for the nation-state's consolidation from independence to the early twentieth century. Besides emphasizing growth on enrollments, educational policies move to inclusion, equity, quality, and labor training. Nonetheless, the public education enterprise has been historically poorly founded. Intergovernmental organizations and national governments pushed for shifts in politics and education policies under the umbrella of a universal educational reform project. Still, it does not eradicate Latin America's distinctive feature and its educational systems prevalence of vast inequalities due to ethnicity, social class, gender, religious beliefs, or sexual orientation fermented in the 19th and 20th centuries. Inequalities that worsened in 2020 because of the Covid-19 contagion.

Although educational reform processes have been complex, diverse, and with innumerable design and implementation problems, to facilitate the analysis, they can be grouped into two main models. One of the initiatives of such reforms to cope with quality and equity is privatizing education systems for economic and ideological reasons. A neoliberal call's dictums favor market mechanisms that emphasize training for productive work, free choice, and school autonomy. However, although without the economic power and propaganda means, democratic tendencies oppose that vision. These conceive education as a public good and propose reforms that stress the human being, respect for cultural differences, and substantive equality.

By the 1980s, most quantitative education indicators showed improvement even though the population grew due to progress in preventive health, but the general perception was that schooling was of low quality. Thus, in the 1990s, intergovernmental institutions nurtured the tendency to decentralize school systems and strengthen adult education and lifelong learning. But at the same time, under central government control, encouraged shifts in the pedagogical orientations from the content and teacher-based curriculum with an emphasis on general teaching to competence-based or constructivist approaches that focus on students' learning. And governments of most countries created specialized institutions to measure such education. The human capital pattern to train for work dominates, but diverse nature experiences flourish to educate for responsible citizenship and freedom. In the reform processes, all participants agreed that the professionalization of teachers was essential. Yet, teacher unions resisted the push for neoliberal reforms.

This article focuses on educational politics and policy. It starts picturing trends after independence in the 1800s and emphasizes the shifts in the 1980s until the present day. It covers from initial education to K12.

Contextual record and basic concepts

Latin America is a geographical area of great contrasts, with modern economies that mix with subsistence or extreme scarcity and vast social disparities and regimes that postulate humanism, democracy, and social justice, but which political practices result in authoritarianism and patronage. Despite so, with few exceptions, the governing groups proclaim the purpose of reforming school systems to improve the quality of education, advance social inclusion, and further equity. Even with all the impetus and expenses, overall, the expected results have not been produced, although there is some progress in enrollment growth, a higher transition between school levels, and vocational education provision.

Although the concepts are not antagonistic, there is a query for education between quality and equity. Both conceptions coincide in the proposals for change. The search for quality education is closer to technocratic approaches under human capital theory, while

the quest for equity pursues humanistic ends. The first stresses measure student performance in literacy and numeracy, the second in the personality's harmonious development.

The word inequality refers to economic or any other magnitudes that are different and feasible to measure. The term inequity and others with the same connotation pass value judgments on those magnitudes. The notion of equity does not mean treating everyone the same way; the concept connects with distributive justice: the fundamental postulate is that the search for equity implies equal (normative) concern for all members of a society (all are equal before the law) and dissimilarity in consideration of those with social disadvantages (Sen, 2009). However, there is a global trend to transform basic education, to which Latin America is no alien. Although it does not disregard the objectives of equity, it superimposes the urgency of raising the quality of teaching, emphasizing the acquisition of skills for the information age: the universal educational reform model.

The universal model of education reform for the information age, mainly promoted by UNESCO, the World Bank, and the OECD, depicts five features: (1) Decentralization / school autonomy. (2) Lifelong learning. (3) Centralized curriculum based on competencies. (4) Central evaluation systems. And (5) Professionalization of teachers (Beech, 2008). Some Latin American governments accepted and adopted such features in the 1990s, however, amid social conflicts and political changes that affected the governance of education systems because, in each case, there is a dialectic between the national and the local (Arnové, 2013). Governments have to deal with internal political forces, face social groups' contentions, and pressure from teachers' unions.

Education and the consolidation of the national state

Schwartzman synthesizes colonization and exploitation history that the Spanish and Portuguese empires subjected to native peoples of what is now Latin America. The conquerors arrived to exploit the new world's treasures. "Many of them did not bring their families, and, even if they did, mingled with the local population and the slaves, creating large, stratified mixed-blood populations that also combined the cultural, religious, and linguistic traits of their different origins." (Schwartzman, 2015) Still, each of the future independent nations developed distinct cultural characteristics. There are countries with a large native population such as Bolivia, Mexico, Peru, and part of Central America, and others where people of European descent are the majority, such as Argentina, Chile, and Uruguay. Immigrants from other regions, Palestine, China, or Japan, for example, enriched the miscegenation and enlarged the cultural complexity of the area.

In the Spanish colonies and Brazil, a Portuguese settlement, the dominant groups were of European ascendance (criollos), and the original population constituted the oppressed castes. The Europeans conquered the native peoples and forced them to work in mining and farming to extract raw materials and grow products for the world market. They also imported millions of Africans to work as slaves on large plantations; the conquerors enforced Catholicism as the official religion and Spanish or Portuguese as the overriding languages.

The wars of independence of Spanish America led to the establishment of republics in the early nineteenth century. Still, most of them suffered civil wars, military dictatorships, and the division of territories. For decades there was nothing, urban and regional centers that struggled to maintain an external representation of a national daydream (Córdova, 1977). Brazil became the Portuguese empire's headquarters until 1889 when it shifted to an independent nation and a republican regime.

Although enlightenment and political liberalism had intellectual influence in Latin American independence struggles, the nascent republics did not forge a liberal democratic state. It was an oligarchic state whose economic structure was inherited from the colonial period: the self-sufficient hacienda (latifundio). It focused on the indigenous population's forced labor, poor mestizos, and descendants of slaves (Medina Echaverría, 1964). In that state, the military caste took charge of the bureaucracy, and the Church of the few education centers. Furthermore, given the collection of tithes and mortgages, the Church became an economic power.

Governments were unstable and bureaucratic, where corruption and compadres abounded. The military and ecclesiastical institutions were the most important. Despite the republican regime, social, economic, and political inequality persisted in the region's countries. Throughout the first century of independence, authorities reestablished political ties with Spain, and Catholicism kept being the official religion; the Catholic Church was part of those states, and even it was the hegemonic power until the late 1860s (Halperin Donghi, 1969).

Although the law established that education would be free in many countries, both due to civil wars and fiscal hardship, education systems were inexistent. Schooling was for a minority, to prepare clergymen and public servants in seminaries and universities. Countries like Mexico, Brazil, Colombia, Argentina, Uruguay, and Ecuador started Lancaster and Bell schools from the 1820s onwards. It was oriented to serve the poorest classes with a student-monitor method. Parishes, humble houses, and public buildings hosted the groups. In Mexico, those schools became part of official instruction in the 1830s (García Benavente, 2015).

The dominant groups, with the landowners at the top, tried to strengthen the state; they maintained their concern for egalitarianism in the field of law, not in practical life. The governing classes wanted the masses to identify with the nation. Strengthening national identity became a mission for education. Against the Church's requests and conservative forces, liberal governments sustained public instruction institutions. The patriotic and civic teachings supported the construction of legitimacy and the crystallization of ferments of collective identity. The concept of homeland became identified with the nation. The first curricula introduced a heroic sense of the recent past constituted by the Independence revolutions. Likewise, the oligarchic groups used

bordering conflicts with other republics as elements to promote the nationalist spirit. Patriotism became an actual national project (Ossenbach Sauter, 1993).

However, school systems' institution was slow and charged with disputes between religious and secular conceptions; nonspiritual thinking was gaining ground, especially in the more populous countries. The most radical expression was in Mexico that after a social revolution, it decreed secular education in the Constitution of 1917, and socialist education in the amendment of 1933 (Ornelas, 1995). During the first decades of the 20th century, Latin American countries struggled to create education systems; first, to increase literacy and to instruct the mass of workers and, second, to force indigenous peoples to speak Spanish or Portuguese and incorporate them into the national state. According to Bergés (2009), literacy percentages grew in the first half of the 20th century, but unevenly. For instance, in 1900, Argentina and Uruguay had rates of literate persons of 51% and 59%. By 1950 it grew to 88% in the first country and 86% in the second. Others, like Mexico and Peru, barely exceeded 20% at the beginning of the century, and, by 1950, they reached 61% and 51%.

As shown in Table 1, except for Bolivia, Brazil, Peru, and the Central American countries, all with high percentages of the indigenous population, illiteracy was less than 20%. In the Dominican Republic and Brazil, there is also a high percentage of people of African descent. Except for Cuba, there are more illiterate women than men. Nevertheless, the gross enrollment rates in primary school were already over 70%, and those in secondary education stood growing. Similarly, the average number of students per teacher in primary school seemed acceptable, but in Colombia, Ecuador, Mexico, Peru, and Central America. The lag in the Dominican Republic was considerable. Funding for public education, however, was (and continues to date) low. Only Costa Rica and Ecuador allocated more than 5% of their GNP to education. According to the Economic Commission for Latin America and the Caribbean (ECLAC), over 90% of spending went to teacher and administrator salaries across the region (ECLAC, 2001).

Although illiteracy among adults was still high in the poorest nations, universal attendance to primary education was a fact in almost all the region's countries. There were progress and some social mobility; schooling systems incorporated large popular sectors. However, the expansion of enrollments did not reduce social inequality; the growing urban middle classes were the primary beneficiaries of the evolution of schooling, while the low quality of education became a matter of concern.

Once national states were consolidated, and the borders between countries varied little, toward the end of the 1960s, the human capital theory began to penetrate educational policy discussions. In contrast, intellectuals started to debate the concept of equal opportunities in the 1970s, and by the 1980s, the emergence of global trends marked the educational politics and policies of Latin America.

Table 1 Basic indicators of education in Latin America (1980).

Country	Illiteracy 15 years + %			Gross enrolmen rates		Gross enrolmen rates		Public spending	
				Primary schooling		Secondary schooling			
	M	F		Ages	Rate	Ages	Rate	Student/teacher primary schooling	%
1 Argentina	6.0	5.7	6.4	6–12	111	13–17	56	19	1.9
2 Bolivia	30.9	19.9	41.3	6–13	76	14–17	37	18	3.8
3 Brazil	25.4	23.7	27.2	7–14	98	15–17	34	26	0.7

The expiration of the 20th-century milieu

Through the 20th century, the oligarchic state archetype moved to various forms of corporatism and military dictatorships; democracy was weak. The idea of education at the homeland service continued, but with increases in enrollment and escalation to secondary and higher education. Also, many governments, like in Argentina, Brazil, Chile, Colombia, Mexico, and Peru, established vocational training to prepare workers for the industry. Still, growth did not mean proper quality instruction; thus, by the 1980s, the leading groups started education reforms aiming at accomplishing better-quality teaching and equity in education. Nevertheless, social exclusion continued to be the landmark locus in Latin America (Treviño, 2005).

The influence of intergovernmental organizations grew; in many countries, they even played as local political actors. In the 1980s, those organizations began to advocate for educational reforms to improve quality; enrollment growth, they argued, while it should continue, was insufficient. Most countries in the region accepted the Jomtien declaration of Education For All (EFA), which UNESCO called to continue with the expansion of enrollment and offer enhanced education (UNESCO, 1993). The era of globalization manifested itself in the strain between studying for work—as proclaimed by organizations such as the World Bank and the OECD—and education as a fundamental human right, championed by UNESCO.

Most of the region's governments accepted the EFA slogans but were unable to meet the goals for the year 2000. However, there were impulses to equity in education due to the propagation of new actors interested in learning. Intellectuals and organizations, such as the Economic Commission for Latin America and the Caribbean, reviewed the slogan of equal opportunities and began to speak of educational equity and social inclusion (Treviño, 2005). In addition to access, it was necessary to guarantee permanence and graduation from schooling levels. Furthermore, the gaps in the quality of education offered to boys and girls, middle and poor classes, urban and rural populations, had to be reduced. The most vulnerable segments of the populaces should be favored. Like Pablo Latapí in Mexico, intellectuals introduced the concept of equity to public debate and proposed compensatory programs to support the disadvantaged (Latapí, 1993).

Throughout the 20th century, governments in the region, churches of various faiths, civil organizations, service clubs, and people in business launched non-formal education projects to alleviate some of the systems' deficiencies. Such as illiteracy and problems derived from social inequity or race or gender issues. UNESCO and other international donors did the same. Unfortunately, by the end of the twentieth century, except for a few short-term or literacy projects that had some success, the record included more failures (Cortina and Stromquist, 2000; Post, 2002; Reimers, 2000; Rivero, 1999). Social exclusion continues to be one of the negative badges of Latin American societies.

Despite these deficiencies and many governments' shortcomings, the hope for better quality and equitable education remained. Dispersed sets of educational experiences that met—not all, but many—of the population's expectations maintained the flame. The ideas of Paulo Freire on popular education took off in the 1970s. Those were edifying exercises whose primary purposes and their center of action were quality and equity: good educational practices (Ornelas, 2005). Still, global institutions pushed for the international model of education reform.

Decentralization: a frail course of action

The World Bank began to gain prominence with proposals for more financing and better administration; educational decentralization, it argued, was the precondition for optimizing the use of scarce resources. Furthermore, bringing the authorities closer to schools and parents would allow governments to understand the schools' problems better and efficiently channel energies to solve them (Winkler, 1989).

Perhaps for internal reasons, but also under the influence of the World Bank, national and local governments took the slogan of educational decentralization. Senior government officials replicated it in their discourse, there were academic forums, and the Bank allocated resources to finance research to strengthen local autonomy and management capacity. The drive covered the entire continent, from Chile and Argentina to Central America and Mexico (Carnoy et al., 2005; Edwards, 2019; Ornelas, 1995). Brazil was a case apart. Its federal system has been in operation since the 19th century, but the states transferred control and primary education financing to the municipalities. The reforms of the 1990s planned to strengthen the counties (Guimarães de Castro, 2015). Cuba and Uruguay decided to keep its school systems under central control.

The policy of educational decentralization had radical tones. In Chile, the extreme case during the Augusto Pinochet government, which transferred public education to the municipalities, established voucher programs that promoted privatization so that it would function according to the logic of the market (Ávalos and Bellei, 2019; Bellei and Vanni, 2015; McEwan and Carnoy, 2000; Muñoz Stuardo and Weinstein Cayuela, 2019). There were community control experiences of schools and school autonomy in areas emerging from civil wars such as EDUCO in El Salvador (Edwards, 2020), later replicated in Guatemala and Honduras (Ganimian, 2016). The ideology of efficiency governed the decentralization efforts in Latin America's education. However, the process in countries that proclaimed educational decentralization transferred degrees of authority and control to sub-national entities—and considerable financial resources in Mexico's case—but centralized the curricular and political decisions in the central ministries (Kubal, 2003).

Although it tried to change discourse and incorporate other actors into the educational policy, the decentralization move did not work overall. There were some exceptions, but a good part of sub-national governments did not go beyond a reformist discourse; in their daily practice, however, they showed disinterest, cooperation with the previous uses and corruptions of the centralized

structure, fear of conflict, or they replicated the speechmaking but did not act on a consequence. By the end of the twentieth century, there was no proof that through the decentralization policies, the region's school systems enhanced the quality of education (Carney, 2012).

Teacher unions and traditional bureaucracy opposed educational decentralization. Some for good reasons, because if there were not enough administrative capacities at the national scale, even less at the sub-national or local levels. Union leaders knew that with decentralization, they would lose power and mediation with the central government (Schneider, 2021). Parents, business associations, or civil society organizations interested in educational tasks without reaching concrete and binding levels of participation, nor institutional and permanent mechanisms (Kubal, 2003).

Lifelong learning: an upright target

Although lifelong learning is part of the international reform model, it is also an ingredient of sustainability projects, with even more history and contributions. The first type of prioritizes economic development and labor productivity skills to increase participation in global value chains and promote equity and inclusion (OECD, 2017). For the second, lifelong learning has a critical role in eradicating poverty, protecting the planet, securing human rights, building peaceful, inclusive, and equal societies, and promoting social, economic, cultural, and technological progress based on the values of the United Nations (UNESCO Institute for Lifelong Education, 2012).

The generic concept in practice until a few decades ago was that of adult education. Lifelong education has two main aspects, literacy (includes digital literacy) and training for productive work. It is a global ideal even before the term globalization was known. Since its creation, UNESCO has promoted six International Conferences on Adult Education CONFITEA (from the French, Conférence International en pratique sur l'Education des Adultes).

A proposal from Mexican diplomats gave way to the Regional Center for Fundamental Education for Latin America (CREFAL). It started in 1951 with the Mexican government's sponsorship and the UNESCO and the Organization of American States' support. Its purpose was to support Latin American governments to meet urgent needs for fundamental education: the training of adult education teachers and the production of teaching materials. To promote a broad multidisciplinary outlook, CREFAL ensured specialized personnel provided by other United Nations Organizations. The International Labor Organization (offered a specialist in arts and crafts); the World Health Organization (experts in health education, childcare, rational nutrition, and individual and social hygiene); the Food and Agriculture Organization professionals in crop improvement methods and conservation of natural resources, home economics, family industries and recreational leisure, organization of rural cooperatives (Torres Bodet, 2017).

Throughout the 1970s, CREFAL became one of Paulo Freire's main disseminators and practitioners' methods and ideas on resistance, hope, and critical consciousness. Freire's best-known texts, *Pedagogy of the oppressed* and *Education as a practice of freedom*, were compulsory readings in seminars and congresses. This institution published books and manuals on literacy and adult education; it even tried to formalize specific Freire's non-formal education proposals (Rodrigues Brandao, 1977). Together with other Mexican and Latin American institutions, CREFAL promoted distance education, job training, strengthening of local cultures and traditions, and international citizenship at its Center for Sustainable Community Development (Beltrán Morales, 2015). Since October 1990, it is named Regional Cooperation Center for Adult Education in Latin America and the Caribbean. Eleven countries are part of it.

All Latin American countries agreed to accomplish the UNESCO's Sustainable Development goal 4, primarily targets 3. Equal success to technical/vocational and higher education; 4. Relevant skills for decent work; and 6. Universal youth literacy (United Nations Organization, 2016). However, due to the World Bank's influence, and because governments detected the need for a competent workforce for industry and services, grew the supply of technical vocational education (ETP) in secondary school. The ECLAC documents that all countries have promoted it, as shown in Table 2 (Sevilla, 2017). The theory of human capital reigns in that territory. However, many social sectors consider it a second-rank training—an offer for the poor classes' offspring, which refutes the motto of social equity.

Although lifelong learning is a shared concept, the query between quality and equity is underlying. It is also in the pedagogical field, but openly between traditional teaching and competence-based curricula, amid contending teaching approaches and the emphasis on transmitting information to learning and critical thinking claims.

The curricula: broken bridges between law and practice

Although diminished by incorporating more subjects in the curriculum, patriotism continues in-school programs in almost all countries. The traditional method, centered on teaching, may still be dominant; teachers' and institutions' cultural persistence is steady in Latin America. However, the competency-based approach makes its way in legislation, agreements between actors and programs. Intergovernmental agencies advocate a pedagogy that emphasizes communication skills, creativity, flexibility, learning to learn, working in groups, and problem-solving (Beech, 2008). Broadly, those programs of change propose a national core curriculum under central control. On a smaller scale, popular education offers similar changes, emphasizing critical awareness, and decolonization of knowledge under the umbrella of intercultural understanding or interculturality (Cortina, 2017).

Table 2 Latin America (ETP programs in school systems with plans for segmented secondary studies).

Country	<i>Propedeutic ETP in the upper secondary</i>		<i>ETP provision variants</i>		
	<i>Years of study</i>	<i>Distinctive title granted</i>	<i>ETP</i>	<i>ETP</i>	<i>Optional ETP deepening</i>
			<i>Prevocational</i>	<i>Professionalizing</i>	
Argentina	5-6 ^{a,b}	Middle technician	Integrated to high ETP	–	–
Brasil	1–3	Middle technician	–	–	–

Uruguay	3	Middle technician	Technological basic cycle	Basic professional training. Qualified operator	–
Venezuela (Bolivarian República of)	6 ^{a,c}	Middle technician	Integrated to high ETP	–	–

^aTotal duration low and high ETP.

^bConsiders the changes included in the reform in progress in that country that extends the ETP from 2 to 3 years and incorporates the basic technical 2-year duration.

^cDuration of ETP equal to one additional year to the academic study plan.

^dDuration of ETP equal to the academic study plan but with a higher hourly load.

Source: Own elaboration based on Sevilla (2017).

Educational reforms increase in the region from the down of the 21st century. Despite significant challenges, Latin America's reformers propose inclusion, respect for human rights, gender equality, interculturality, and recognition of the different. Besides, a few improvements in the governance of educational systems (Saavedra and Gutierrez, 2020). The states carried out reforms; yet, with many of its instruments of power diminished. The weakening of the state's power was either by expanding democracy or following neoliberal policies or authoritarian regimes.

Despite the exciting project of education reform under intergovernmental bodies' guidance, there is no single route for each nation. Several countries in the region undertook ambitious reforms, with different results. In almost all the region's countries, the Constitution or the law establishes that the primary purpose of education is the full development of the human personality, as stated by UNESCO's Education for All. Besides, school systems must promote freedom, peace, social justice, solidarity, cooperation, integration of peoples, and respect for nature. They establish democratic rights and principles, commit to each country's cultural identity or region, intellectual, artistic, physical, intercultural, moral, and civic education. They ban social discrimination, either in the curricula or the classrooms. Still, it seems quite challenging to put into practice such proposals with a centralized curriculum. An overview will illustrate the point (Posner, 2017b; Schwartzman, 2015).

In 2006 the Argentine Congress approved the National Education Law and two critical programs to promote inclusion: Universal Child Allowance, a massive conditional cash transfer program for families in poverty, and Connect Equality (Beech, 2019). In Chile, during Bachelet's second government (2014–18), three laws were enacted after intense debates: Inclusion, New Public Education, and Teacher Professional Development, with them the state tried to correct the adverse effects on the educational system of neoliberal ideology inherited from the dictatorial period, from 1973 to 1990 (Ávalos and Bellei, 2019; Muñoz Stuardo and Weinstein Cayuela, 2019). After some progress since the 1990s, President Evo Morales dismantled democratic aspects of Bolivian education that had guaranteed a diverse and decentralized administration as a necessary means for a multicultural Bolivia, and projected a national curriculum, although maintaining multiculturalism and intercultural approaches (Andrade Ramos and Blanco Cossío, 2015). While in Brazil, the Common Bases of the National Curriculum (2017) promotes the inclusion of marginalized groups, encouraging an egalitarian society that takes plurality in terms of gender, ethnicity, race, language, and others (Ivenicki, 2019). But the Bolsonaro government tries to dismantle its few achievements.

Uruguay and Costa Rica have enviable political systems in Latin America: democratic governments, low corruption, stability, and their population and territories are small; they enjoy vigorous institutions. In 2010, the Uruguayan government designed the National Strategy for Children and Adolescents 2010–1030, including flexible hours in the classroom (Vaillant, 2015). Costa Rica abolished the army in 1948. According to the OECD, Costa Rica is among the countries in the region with the best educational performance; it has made great strides in early childhood education, elementary schooling, and a more significant transition to high school. However, the same OECD recommends diversifying its curriculum to emphasize critical thinking instead of rote memorization (Román Vega, 2019).

In Peru, in the government of Alejandro Toledo, the Congress approved the General Law of Education (2003). It emphasized democratization and decentralization of the education system and proposed a Sectorial Emergency Plan to improve the quality of education. However, the changes are in the air due to political instability (Balarin and Rodríguez, 2019). Likewise, in Ecuador, when the government of Rafael Correa pushed in 2008 for a new Constitution and the National Development Plan: “Good Life” (Buen Vivir) 2009–13, which articulated a popular alternative (Baxter, 2019). While Juan Manuel Santos, the President of Colombia, crowned his effort in 2018, he applied for his country’s entry to the OECD in 2011. One of the requirements involved an evaluation of educational policy, especially to reduce inequality. The 2014–18 National Development Plan expressed 19 strategic lines (Guevara Ramírez and Téllez Rico, 2019).

In Mexico, President Peña Nieto launched an educational reform in 2012. The government and allied parties achieved constitutional amendments, changes in the General Education Law, and two new laws. One granted autonomy to the National Institute for the Evaluation of Education, and the General Law Professional Teaching Service, which instituted a meritocratic system for teachers and administrators. In 2017 the Public Education Secretary launched the “Educational model for compulsory education: educating for freedom and creativity.” However, in 2018, Andrés Manuel López Obrador’s new government buried the reform (Ornelas, 2019).

Other countries tried changes, but institutional inertia or political conditions did not allow them, or the governments did not seek them, but in rhetoric. In Paraguay, after the overthrow of the Alfredo Stroessner dictatorship in 1989, the different governments promote education. The educational system shows a significant increase in enrollment, but poverty, especially among indigenous people and children with disabilities, imposes barriers to the right to education (Brizuela, 2015). In Venezuela, after Hugo Chávez’ rise to power, a process began to institutionalize a parallel educational system to build a communal state: the educational missions, whose main criterion is inclusion, measured by the number of students enrolled. The 2009 Constitution of the Bolivarian Republic of Venezuela draws a path for constructing socialism in the 21st century (Mundó, 2015). Panama is a rare case of sustained economic growth and poor performance of its educational system, according to the Latin American Laboratory for Assessment of the Quality of Education (LLECE) and OECD evaluations due to the low investment in education and the lack of certified teachers (Guardia Wald, 2017). In Nicaragua, during the second Sandinista period — that started in 2006 — despite proposing significant actions in the National Human Development Plan, there are no substantive advances; the Ministry of Education recentralized the educational system (Flóres and Elvir, 2017). Still, in Guatemala, the situation is worse. According to Posner (2017a), there are ghost schools; others abandoned, an inadequate number of teachers with low qualifications. Poor peasants, indigenous of Mayan descent, are the most disadvantaged. The Dominican Republic ranks last the LLECE tests. It frustrates the mood for modernization, despite the government’s efforts to introduce competency-based curricular reform to focus on student learning, increasing instructional time, extending the school day, improving teaching training, and bolstering early childhood education (Hamm and Martínez, 2017).

Other countries have highs and lows in reform and institutionalization of educational projects; yet, there is some progress. Although modestly, El Salvador and Honduras show achievements in improving their school systems. There are a few advances in social inclusion due to full-time schools and subsidies to the poor, especially in rural areas, with textbooks, uniforms, and other supplies. In El Salvador, those improvements are not entirely due to the Ministry of Education, but to social inclusion programs like Education with Community Participation [EDUCO] (Edwards, 2019). Thanks to the support and dissemination of the World Bank, EDUCO became famous as a successful innovation. The government turned it off in 2011; nevertheless, the Bank bets to replicate it in other countries, including Guatemala and Honduras (Ganimian, 2016). In Honduras, despite poverty, violence, and mass migration, reforms are underway, attached to UNESCO’s Education for All. The Secretary of State for Education prepared the Educational Reform Program underway (Luque, 2017).

However, putting prescribed law into practice is a complicated matter. The panorama of the reforms is of prominences and gorges, except in Cuba.

According to international observations, in Cuba, education of high-quality is a universal right. An exceptional state, in many ways. Cuba has a dynamic and egalitarian education system. Since the triumph of the Revolution, in 1959, the government undertook an educational policy called the four revolutions to improve education (Ginsburg and García Batista, 2019). According to Carnoy (2007), the Cuban school’s success is due to the social context that is highly supportive of academic achievement. Besides, the uninterrupted political commitment of national leaders, the strict monitoring of the national curriculum, the supervision and support for teachers, and continued funding, despite the scarcity of public resources.

A conceivable motive for the low educational performance in Latin America may have less to do with embracing the universal reform wrap. It would have more to do with rougher governance issues since several decades of neoliberal reforms or dictatorships undermined states’ ability to successfully implement political changes. It is a matter of political allegiance. Cuba’s academic advantage is due to two leading causes, according to Carnoy (2007): (1) Teachers stress a child-centered and problem-solving approach, which aims the students to develop the ability to work in groups and be creative. (2) The state strictly enforces the curriculum’s

implementation through a chain of command that begins with the Minister of Education and ends with schools' principals supervising teachers in their classrooms. Neither free choice nor school autonomy.

Nevertheless, other of the universal project pillars, centralized learning assessment, is underway in most countries of the region.

Assessment to cope with low quality of education

The discourse on the low quality of education in Latin American countries took supremacy in the globalization era. At the turn of the century, the assessment of learning became the new mantra to raise educational quality. That was a global tool advocated by inter-governmental organizations. Most states established a standardized assessment of learning as a new regulator of instructional practices, which acted on students, schools, and teachers (Rivas, 2015:19). The most enthusiastic promoters were the Latin American Laboratory for Assessment of the Quality of Education and the Organization for Economic Cooperation and Development.

The UNESCO documents that LLECE emerged in the 1990s, where many countries in the region were promoting education reforms with insufficient data for their design. They also lacked a critical mass to measure educational quality. In the 1990s, only a few countries conducted national educational assessments, which were generally not released to the public. In 1997 the Laboratory applied the First Regional Comparative and Explanatory Study (PERCE) among students in third and fourth grades of primary education, reading, and mathematics. LLECE implemented the second comparative study (SERCE) in 2007 and the third (TERCE) in 2013. The tools and results of these last two allowed comparisons over time in students' learning achievements in the third and sixth grades of primary education in the areas of reading and mathematics, as shown in Table 3 (LLECE, 2014).

The natural sciences test was only applied in sixth-grade primary and were voluntary in SERCE. As a result, both studies for comparison purposes are only available for seven countries and the Mexican state of Nuevo León. Although Cuban students participated in the three assessments showed a higher performance than the rest of their peers from the 16 participating countries. However, their results are not comparable, according to LLECE.

Nonetheless, even though only nine countries in the region applied it, the OECD's Program for International Student Assessment (PISA) stood as the superlative measure. Only Brazil and Mexico have participated in PISA since 2000. Argentina did not participate in 2003, and the OECD did not publish its 2015 outcomes. Chile excluded its involvement in 2003. Colombia has partaken the tests since 2006; the Dominican Republic is associated with PISA in 2015 and 2018. Panama joined the assessment in 2009, but in 2012. Peru maintained its students out in 2003 y 2006, and Uruguay joined since 2003. In 2018, the nine countries participated. Table 4 summarizes the historical trend.

PISA has two contradictory drifts, a switch on the traditional modes of communication of achievement, not only enrollment, infrastructure, and curricula, but also what the OECD assumes it is worth learning. On the one hand, it promotes the project of universal reform that tries to ensure that all countries tend to be homogeneous (Beech, 2008) and that "Skills for life," which

Table 3 Student's learning achievements.

Source: Own elaboration with the help of Diego Amado De Leon and Eduardo López Guadarrama: OECD, (2019). PISA Databases 2000, 2006, 2009, 2012, 2015, 2018: <https://www.google.com/search?q=pisa+dataset&oq=PISA+data&aqs=chrome>.

includes the teaching of language, mathematics, and science, become the cornerstones of the education through K12. On the other hand, it hierarchizes the countries when preparing rankings according to their students' results in those tests' performance.

As in the rest of the world, PISA sparks debates; it has advocates beyond governments and the OECD itself and critics who point out its irrelevance to education because it focusses on a few subjects. Ravela (2011) sees two advantages. First, PISA forces to leave the endogenous reference to analyze Latin American countries' educational situation in a broader context. Also, it helps to understand the overall situation better. Second, participation in international studies represents an opportunity for learning and accumulating knowledge for national evaluation institutions.

At the other extreme, as summarized by Antonio Bolívar (2011), it produces a feeling of failure: "The population is disconnected or dissatisfied with appearing in the successive PISA Reports, which help to determine their respective policies as 'losers' in comparison with other countries." And, what is critical in terms of social perceptions, is that although PISA contains much more than test results, the "[...] news media prioritizes the results of the rankings, reinforcing the dichotomy of 'winners' and 'losers,' between countries that offer a good education and others that provide a mediocre or poor one."

The OECD sees itself as a promoter of equity and good governance in education (Melchor, 2008). In comparison, PISA critics note that in addition to offering its technical expertise in measuring learning and schooling performance, the OECD also became an internal political actor (Lingard et al., 2016). It also wields power and pushes the technocratic approach to rule by numbers (Grek, 2009). Certainly, PISA provokes new institutional arrangements in many countries.

Participation in PISA caused discomfort for the results, but it also generated protests from academics and journalists to governments for the low quality of education; SERCE and TERCE did not make as much debate. Nonetheless, the tendency to evaluate education had institutional consequences. In much of Latin America, governments established national institutes to measure the quality of education and students and teachers (Bruno et al., 2019). Standardized international and domestic assessments led to rejection by the teachers' unions. They alleged that high ranking functionaries and politicians blamed educators for low test scores of all kinds and other ills in education.

As in other parts of the world, in Latin America, certain segments of the governing groups criticized teachers for schools' deficiencies and, at the same time, pinned hopes for substantive change on teachers. UNESCO, the World Bank, the OECD, and other intergovernmental organizations proposed reforms emphasizing effective schools, principal's leadership, student achievement, and dynamic forms of governance to raise the quality of education. To achieve any of these purposes, the professionalization of teachers became a required subject.

Teacher professionalization, identity, and collective representation

Although the nation-states were not yet fully consolidated, liberal governments began to build schools. In Chile, Argentina, Mexico, Peru, and Colombia, they looked to France for a model to follow: a system under state control. However, governments lacked assets and personnel to teach. As in the schools of the Lancaster-Bell system, they used upper-grade students to help the few teachers and governesses; these students became instructors by empirical means and were among the first teachers in normal schools to train preceptors from the 1820s.

The modern normal schools began their institution from the 1850s (Weinberg, 1995), molded in the French style. Being graduated from a teacher college was the beginning of the normalista identity. Identity includes the notion of equality, permanence, continuity, durability, a fixed human attribute with which one is born, or has as a destiny (Navarrete Cazales, 2016); it is collective and individual. The collective identity stresses the idea of equality, the individual, of merit; the collective generates shared beliefs,

symbols, and rituals that give a group a particular distinction. The normalista identity is one of the most deeply rooted characteristics in the educational systems of Latin America.

These community attributes combined well with the formation of school systems under the state's tutelage and, therefore, facilitated unions' institution to represent the working benefits of teachers first and then their professional interests. In its origins, as early as the 20th century, teachers' unions distinguished themselves by defending the rights of their members: fighting for better wages, job security, recognition for seniority, and fringe benefits such as health and housing. They also advocated improving their schools and social acceptance of their work (Tedesco and Fanfani, 2006). However, they had fractures regarding their professional identity.

Throughout the 20th century, there were debates to characterize teachers' work; authors disputed whether their labor was a trade (like that of a master craftsman), a profession, or a salaried job (Tenti Fanfani, 2006). A widespread belief among public school teachers is that teaching was a state profession, ergo, that they were civil servants (but not bureaucrats). Some thought that having a bachelor's degree was the attribute of the trade. And the teachers' unions reinforced that collective idea. Following the international educational reform project, the changes of recent years refute such a trend (Ornelas, 2018). But teachers' unions are more than representative union bodies; they are also interest groups, like in Chile, Brazil, and Argentina, or robust political machines, like in Mexico and Ecuador (Schneider, 2021), and represent the opposition to neoliberal reforms (Loyo, 2019). Other authors point to the positive impact that unions have on instruction and a teachers' sense of purpose (Gindin and Finger, 2013).

Almost all the authors agree that teachers' unions play a significant role in education policymaking in Latin America. That is because unionized public sector workers can process information that affects the policy arena under their influence and can monitor government activities. Through mandatory fees from their members, unions often have access to vast financial resources. Federations with large membership can also use strikes and protests politically in the streets to advance their demands (Bruns and Luque, 2015). The extreme case of influence is that of the National Union of Education Workers (SNTE) of Mexico, with around 1,400,000 members. Through their affiliation to the Institutional Revolutionary Party, since the founding of the union in 1943, and later in an alliance with the National Action Party (2000–12), the leaders controlled teachers' labor trajectory from entering the schools to their retirement (Chambers-Ju and Finger, 2016). The politics of patronage reached the extreme that teachers who retired could inherit their jobs or, if they did not have teacher heirs, sell them to the highest bidder (Ornelas, 2018). Corruption reached the point that there were ghost schools and teachers and more than 100,000 deceased and retired people in the payroll (H.T., 2014).

There are many teacher unions in Latin America (Table 5) that, although have differences between them, defend the traditional identities attached to rote-memory, collective action for recruitment, and certification by the state. The modernizing reformers thought that such attributes were a cause—not that it was exclusive—of the low quality of education. For that reason, the 21st century reforms incorporated critical legislative changes to professionalize teachers (which implies that they were not professionals).

Elacqua et al. (2018) discuss how the laws of the Teacher Professional Development System in Chile (2016), the Statute of Teacher Professionalization in Colombia (2002), the Organic Law of Intercultural Education in Ecuador (2011), the General Law of the Professional Teacher Service in Mexico (2013), and Law of Teacher Reform in Peru (2012) seek to make the teaching profession more attractive to talented young people. Also, to improve future teachers' training, that implies reforming the traditional schools—the crucial aspect: selecting the best candidates for the profession, which requires rigorous examinations. And, in return, supporting new teachers with tutoring. The current Mexican government repealed the teachers' law in 2019 and, although it does not mean a return to the past, it substantially recovers the normalista spirit; the SNTE recovered a good part of the power that the Peña Nieto government (2012–18) wanted to take from it (Ornelas, 2019).

The core of the teaching profession's reform purposes is to accentuate individual identity, put merit as the primary attribute, knowledge, and practices appropriate for the present and the future. That includes using more information and communication technologies. Changes in recruitment methods, decision-making skills (personal initiative and open mind), and a new type of work ethic, as proposed by UNESCO, the World Bank, and the OECD.

Covid-19 and the right to education

In Mexico, there is a saying. "It rains over wet." It means that if something is wrong, an external event aggravates it. And that happens to educational systems with Covid-19. The Latin American Campaign for the Right to Education (CLADE, by its initials in Spanish) expressed its concern that the pandemic deepens historical inequalities. In Latin America and the Caribbean, 74% of all enrolled students were affected by schools' closure (Croso, 2020). For millions of children, adolescents, and young people, especially those in situations of greater vulnerability, the shutting of schools implies the temporary loss of studies and the stoppage of dialogs between teachers and students. Furthermore, it injures a fundamental safety net, including nutrition, health, emotional support, and protection against domestic violence and sexual abuse.

This article comes to an end in August 2020. There is still not enough academic work to substantiate the consequences of Covid-19 on education. Still, the press and media report that the disease aggravated pre-existing problems and increased economic and social inequality, femicide and sexual assault, and discrimination based on ethnic origin, gender, or belief.

Many governments responded to the emergency of Covid-19 with promptness through distance education, as in Argentina, Chile, Colombia, Mexico, Peru, and Uruguay. They even made efforts to ensure that the programs reached the most significant number of inhabitants. Still, children from low-income families—the majority indigenous or Afro-descendants—do not have, or

Table 5 Teachers' unions in Latin America, unity, and fragmentation. Selected countries by the availability of data, as of 2010.

Country	Teachers union(s)	Unity density	Fragmentation
Argentina	Confederación de Trabajadores de la Educación de la República Argentina - Confederation of Education Workers of the Argentine Republic (CTERA)	50.8% (234 000)	High fragmentation (effective coordination through CTERA)
Brazil	Confederação Nacional dos Trabalhadores em Educação National Confederation of Education Workers (CNTE)	44.2% (925 229)	High fragmentation (partial coordination through CNTE)
Chile	Colegio de Profesores - Collegiate of Teachers	53.3% (71 982)	Monopoly of representation
Colombia	Federación Colombiana de Educadores - Colombian Federation of Educators	81.6 (as of 2007)	Monopoly of representation
Costa Rica	Asociación Nacional de Educadores - National Association of Educators (ANDE); Asociación de Profesores de Segunda Enseñanza - Second School Teachers Association (APSE); Colegio de Licenciados y Profesores en Letras, Filosofía, Ciencias y Artes - Collegiate of Graduates and Professors in Letters, Philosophy, Sciences and Arts (COLYPRO); Sindicato de Trabajadores de la Educación Costarricense - Union of Costa Rican Education Workers (SEC)	100% (membership estimated 140,000–200,000)	Fragmentation by education level
Ecuador	Unión Nacional de Educadores - National Union of Educators (UNE); Frente Unionista de los Trabajadores de Educación del Ecuador - Unionist Front of Education Workers of Ecuador (FUTE)	79%–90% for UNE during 1990's, 79% first decade of 20th century	Monopoly of representation
Honduras	Colegio Profesional para la Superación Magisterial de Honduras - Professional Collegiate for Teacher Improvement of Honduras (COLPROSUMAH); Primer Colegio Profesional Hondureño de Maestros - First Honduran Professional Collegiate of Teachers (PRICPHMA); Colegio de Profesores de Educación Media de Honduras - Collegiate of Teachers of Secondary Education of Honduras (COPEMH)	Mandatory affiliation	Fragmented
México	Sindicato Nacional de Trabajadores de la Educación - National Union of Education Workers (SNTE)	100% (between 1200 000 and 1, 500,000 members)	Monopoly of representation
Paraguay	Federación de Educadores de Paraguay - Federation of Educators of Paraguay (FEP), Organización de Trabajadores de la Educación del Paraguay - Organization of Education Workers of Paraguay (OTEP); Unión Nacional de Educadores - National Union of Educators (UNE); Agrupación de Docentes y Funcionarios de la Educación Paraguaya - Association of Paraguayan Education Officials and Teachers (ADOFEF); and Federación de Educadores de Capital e Interior Federation of Educators of Capital and Interior (FECI).	55% (15 000; 14 000; 15 000; information on The membership for ADOFEF and FECI is not available)	Fragmented
Peru	Sindicato Único de Trabajadores de la Educación del Perú - Unique Union of Education Workers of Peru (SUTEP); Sindicato de Docentes de Educación Superior del Perú - Union of Higher Education Professors of Peru (SIDESP)	41.9% between 145,000 and 200,000)	Monopoly of representation
Uruguay	Federación Uruguaya de Magisterio – Trabajadores de la Enseñanza - Uruguayan Federation of Teaching - Teaching Workers (FUM-TEP) for primary education; Federación Nacional de Profesores de Enseñanza Secundaria - National Federation of Secondary Education Teachers (FENAPES)	77% for primary schools	Fragmented by education level

is scarce, access to computers and the Internet; they do not even have electricity in many places. The contagion widened the digital divide. CLADE underlines that it highlighted the dramatic consequences of the precariousness of public services that so many governments maintain in Latin America and the Caribbean: "There is no doubt that the pandemic and the closure of schools will have an impact on the realization of the right to education in the short, medium, and long term."

Ending

Covid-19 contained, at least for a few more years, the wave of educational reforms that reached Latin America as an imported good of the globalization. At the end of the 1980s, global intergovernmental organizations inserted themselves into the political life of nations. They demanded educational reforms, which many governments accepted willingly, and others forced by the context of dependency. Reform drives have removed specific attributes of the educational systems formed in the 19th century, but—maybe—not their fundamental matrix.

Although organizations such as UNESCO, the World Bank, and the OECD promote the educational reform's universal project, it is not homogeneous. UNESCO is faithful to its humanistic origin. It encourages changes under the motto that education is a fundamental human right, that its primary purpose is to develop the faculties of the human being harmoniously. Native educational streams of Latin America, such as popular and intercultural education, or the Southern epistemologies promote hundreds of small-scale projects that pursue similar purposes. Since the Jomtien Conference on Education for All, that mandate is now in bylaws and even constitutions.

Furthermore, all the region's countries signed the Millennium Goals and endorsed the Inchon Pact on September 25, 2015. The area leaders adopted a set of global goals to eradicate poverty, protect the planet, and ensure prosperity for all as part of a new sustainable development agenda. It assumes that democracy is the political basis for sustainability. Each objective has goals that must be achieved by 2030. Goal 4 proposes that governments should establish quality, inclusive, and equitable education.

The language of the World Bank and the OECD also includes those words as purposes. However, the approach is different; the emphasis is on preparing a mass of laborers to acquire productive work skills in a global world. The concept of long-life education, for example, puts skills for life as the critical tool, with productivism or neoliberal approaches. At the same time, humanists argue that it should serve to forge the character of people.

Those are two different bets so that, through education, countries achieve progress in social inclusion, democratization, and sustainable development. However, together with political authoritarianism, inequality and social segregation are firmly established in Latin America's reality. It is a historical heritage that is difficult to eradicate and, perhaps, globalization will not solve such legacy, but rather exacerbate it.

Yet, it is an obligation of teachers, scholars, and democratic organizations of civil society to continue the struggle at the local and national scales for a quality, humanistic education that prepares the largest possible number of children and adolescents for a world increasingly complex.

There are multiple ways to consider the Asia-Pacific, including the fact that for some it is no longer relevant. It would be easier to adopt a realist approach to definition, but as shown below such an approach underestimates not only the complexity of geographies, social systems and politics but also fails to interrogate the idea that underlies the construct of Asia Pacific. As the Australian historian, [Spate \(1977\)](#) commented, with reference to the Pacific element of the construct, “the outsiders named the Ocean, gave it bounds, and in a not trivial sense ‘the Pacific’ as a concept is a Euroamerican artifact. But it was not just ‘made in Europe’; the local materials were not inert.” (p. 211). Apart from providing a history of how what was called by some the “South Sea” became the “Pacific”, [Spate \(1977\)](#) also pointed out that the name change was linked to concerns of European traders over centuries (p. 210). Naming, therefore, is not necessarily, or even primarily, a simple realist action. Rather, naming can be symbolic of other meanings and intentions, some might say an act of imagination. In what follows three broad themes will be explored:

- Multiple ways of understanding the Asia-Pacific;
- Constructions of education within these multiple geographies; and
- Multiple geographies as pathways for student mobility

Multiple ways of understanding the Asia-Pacific

Asia-Pacific – a realist perspective

The United Nations Economic and Social Commission for Asia and the Pacific (UNESCAP) provides a good example of a realist perspective on the Asia-Pacific. It unambiguously identifies five major sub-regions making up the Asia Pacific: East and North Asia, North and Central Asia, South and South East Asia, South and South West Asia and the Pacific ([UNESCAP, 2020](#)). This is largely an administrative construction of the region that complements other regional groupings within the United Nations (UN) system. Such groupings, for example, are used to report progress on the UN’s Sustainable Development Goals (SDG). The information provided is limited, but not unimportant, as shown below.

In terms of SDG 4 related to Quality Education the 2020 report showed that three of the sub-regions were making reasonable progress (East and North Asia, North and Central Asia, South and South East Asia), one was making moderate progress (South and South West Asia) while one was making little progress at all (the Pacific). There was a different pattern on SDG 5 related to Gender Equality. Two were making moderate progress (the Pacific and South and South East Asia) while the remainder were making very little progress. In relation to SDG 10, Reduced Inequalities, only North and Central Asia was making reasonable progress, South and South East Asia was actually regressing while the remainder were making moderate progress. More detailed and fine-grained assessments are also provided, but they provide limited insights. Nevertheless, what stands out is the diversity across the region, but with no explanation of why such diversity exists or how it might be remedied. This is an important issue in the context of a realist Asia-Pacific. Yet that is not the only way to consider the region and the education and social developments embedded within it.

Asia-Pacific – alternative constructions

In contrast to the realist perspective, [Dirlik \(1992\)](#) argued that:

In a fundamentalist sense, there is no Pacific region that is an “objective” given, but only a competing set of ideational constructs that project upon a certain location on a globe the imperatives of interest, power or vision of these historically produced relationships (p. 56).

Dirlik's (1992) subsequent narrative argued that the Asia-Pacific region would be better named "the Euro-American Pacific" (p. 59). This is a reflection that the region, no matter how it is described geographically, has little to do with the people who actually inhabit it, their needs, wishes or priorities. Rather, it is about the way those outside the "region" see its value in trading and commercial terms. At one time both Asia and the Pacific were the focus of European imperialism when naked force was used to exert the will of the invaders. In post-colonial times the will for domination has not disappeared it has simply re-emerged in a different form. Even a country like the United States, itself born out of colonial conflict, emerged in the nineteenth century with its own colonialist agenda driven by what was seen as economic needs and imperatives. As Dirlik's (1992) pointed out "this structure expressed the demands of the nascent capitalist order that informed the new vision, rather than expressing needs intrinsic to the region" (p. 66). This broader issue has been highlighted recently by Chua (2021) who, in writing about "the monstrosities of maritime capitalism" made the point that "unique among other spaces of capitalist production, the sea is both passageway and precondition for capitalism to conquer new frontiers."

Both Dirlik (1992) and Spate (1977) stressed the historical contexts that led to the construction of a region driven by external forces rather than by those who actually lived in it. Toward the end of the twentieth century, however, there were new attempts to reconstruct the region initially for economic reasons but subsequently for security concerns.

The first of these was a forum for Asia Pacific Economic Cooperation (APEC), an exclusivist organization set up at the instigation of Australian politicians to take advantage of the growing economies of East Asia. It reflected late twentieth century neo-liberalism and a continuing colonial mentality toward both Asian and Pacific Ocean participants. Its purpose was "to preserve and extend a process of market integration among rapidly growing economies and their major regional partners" (Garnaut, 1999, pp. 2–3). Initial membership included Korea, Japan and ASEAN members Australia and New Zealand, the United States and Canada. Within a few years Hong Kong, Taiwan and China were added. The criterion for inclusion was that "these were economies ... were committed to internationally-oriented growth and conducted a high proportion of their trade with other Asia Pacific economies" (Garnaut, 1999, pp. 4–5). A number of other countries joined at a later stage (Vietnam, Russia, Chile, Peru). The most notable exclusion was the Pacific Islands that were seen to lack capacity with Papua New Guinea being the exception. Thus "the Pacific" in the context of APEC was Australia, North America and the three Latin American countries with the entire area of the Pacific Ocean excluded. This was neoliberalism's ideology for a twentieth century "Asia-Pacific" grounded firmly in the way developed economies constructed their needs and excluding all those who were judged as incapable of contributing.

Even though there were exclusions from APEC in order to create a set of countries of equal economic capacity and potential this did not mean it was an organization of equals. As Ravenhill (1999) pointed out, APEC's agenda was transformed in part by pressure from North American and Oceanic countries which saw APEC as another forum for exerting leverage to open up East Asian markets (p. 232). Societies in East Asia such as South Korea, Taiwan and Hong Kong became known as of the four "Asian tigers" (p. 33), the fourth one being Singapore (Castells, 1992). They managed to "maintain ... the highest rate of GNP growth in the world over 25 years, and won substantial shares of the world market economy" (Castells, 1992, p. 34). Countries such as the United States, Australia and New Zealand, former colonies themselves, adopted what seemed like a very colonial attitude to East Asia (Sidaway, 2002):

In the 1980s and 1990s, a sense of rising Asian confidence and development produced a desire for engagement/response within Australia, New Zealand, Canada and the USA. In the 1980s, in the context of a discourse of Asian miracles and dynamism, these "old" colonial-settler states became anxious about their prospect (p. 205).

Thus, APEC's construction of the "Asia-Pacific" can be seen as an attempt by these settler societies to keep the "Asian tigers" in check, or at the very least to share in their expansion and growth. This neoliberal idea continued, but it was not the only idea that sought to use the region for its own purposes.

If the late twentieth century saw the Asia-Pacific constructed in neoliberal terms, the 21st century's focus has been on security. The geography of the new security entity has been referred to as the Indo-Pacific, bringing together the two oceans with ASEAN sitting almost at the fulcrum of this giant entity. Medcalf (2015) argued that the idea of this two oceans strategy had its origins in Australian defense planning. Yet Choong (2019) traced the idea to exchanges between Japan and India as far back as 2007 when Japanese Prime Minister Shinzo Abe made an impassioned call for a "dynamic coupling" of the Indian and Pacific Oceans as "seas of freedom and of prosperity." Soon after the Quadrilateral Security Dialog, subsequently referred to as 'the QUAD', especially by the Biden administration, consisted of the United States, Australia, Japan and India, engaged in a rare meeting. Tellis (2020) traced US thinking about the Indo-Pacific to earlier foreign policy experience in the region. Thus when in 2019 the US announced its Indo-Pacific Strategy (IPS) Report, it was little more than a restatement of these earlier attempts to focus on these parts of the world. Yet there was a new element. Wanandi (2019) pointed out that, "Quad 2 can be seen as the implementation of the US' national strategy for containing China" (p. 55). Denisov et al. (2021), on the other hand, provided a more nuanced analysis suggesting that entities like ASEAN and countries like Japan were more multilateral in their orientation and did not necessarily endorse the anti-China elements of the US position. This view was supported by (Tan, 2020; Choong, 2019).

The US' strategic opposition to China was multi-pronged but its Belt and Road Initiative (BRI) raised particular issues (Ching and Wu, 2018a,b). The BRI was global in nature and, from the Chinese perspective, operated within the region providing infrastructure support and funding opportunities for a range of countries not only in Asia but also as far afield as Africa and even in

Europe and Australia (Rolland, 2017). Others, however, saw it as creating debt traps (Hurley et al., 2019), creating trade imbalances (Cheng, 2016) and causing environmental problems (Ascensão et al., 2018). The IPS, as a security concept, therefore, was an attempt to curtail what was seen as Chinese expansionism and promote a Western oriented alternative, albeit with an Asian flavor provided by Japan and India. An expanded alternative was proposed by President Biden in 2021 called “Build Back Better World,” (B3W) specifically to counter BRI. Both B3W and BRI were strategic global initiatives representing the changed balance of power in the Asia-Pacific in the 21st century.

Finally, people of the Pacific Ocean came up with their own idea of how to deal with the region. Referred to as *The 2050 Strategy for the Blue Pacific Continent* (Pacific Islands Forum, n.d.), The Strategy identified multiple challenges for Pacific Island countries: climate change, aid dependency, poor economic growth, poverty and inequalities distance from markets, small economic base, transport costs with just one brief reference to security (Council Pacific Affairs, 2021) although there was a recognition that external factors influenced the region. Yet these were not of central concern to those who lived in the region. Nevertheless, at a discussion of the region’s strategic issues that subsequently took place in Australia almost the entire focus was on security highlighted particularly by those in Australia’s security establishment (Wallis and Batley, 2020). At one point in the discussion one Pacific island participant responded, “the Pacific doesn’t need national security; it needs wellbeing”.

For reasons that are difficult to comprehend, Australia security officials continued to argue that China’s presence in the Pacific was a security threat to Australia and therefore this should be a concern for Pacific Island countries. Yet the “Blue Pacific” was an idea of local people concerned about the future and their wellbeing; the Australian response was to highlight the security goals of the Indo-Pacific, subduing local needs and the people who actually lived in the Pacific rather than on its rim. In reality this represented how the Pacific side of the Asia-Pacific had always been treated. The indigenous strategy, the Blue Pacific, was an important fight back against external and peripheral constructions of the Asia-Pacific.

The multiple ideas of Asia-Pacific as discussed above show that such ideas have changed over time, even in terms of the geographies that define the region. The Asia-Pacific has been constructed to suit assumed economic and security needs usually with little or no participation of the people who actually inhabit the region. While there are realist conceptions of the region adopted by organizations such as UNESCO, they are little more than lines drawn on a map for administrative convenience. In what follows, reference will be made to educational issues within a broadly defined Asia-Pacific but with the understanding that the idea of the region can change at any time under multiple external influences that over time have constantly reconstructed it.

Constructions of education within the multiple geographies of the Asia-Pacific

Chen (2005) has argued that research should “cease ... to look at Asia as object of analysis” (p. 141) but rather as a point of reference, and importantly as a means of “inter-referencing.” Koh (2018) pointed out that this can be taken to mean that Western ideas, values or countries do not have to be reference for any discussion. As Chen (2005) pointed out:

Mediating through the horizon of “Asia” as an imaginary anchoring point, societies in Asia could begin to mutually see the existence of one another and become one another’s reference points (p. 140).

This “inter-referencing approach” will be taken in this section that seeks to view the Asia-Pacific through the lenses provided by various aspects of education.

International assessments and the education divide

PISA, 2018 (OECD, 2019) tested students from 77 countries in the areas of mathematics, science and reading. Putting aside technical issues about the resulting measurements and the social and political implications that arise from international testing regimes, one key issue rarely given any attention is a significant regional education divide across all three areas. East Asian societies (Mainland China, Macao Hong Kong, Korea and Taiwan) and Singapore all perform above the OECD average while South-East Asian societies (Malaysia, Brunei Darussalam, Thailand, Indonesia and the Philippines) all score below the OECD average. While the comparison of scale scores is not always helpful, the differences between the top East Asian society (China in each case) and the top South East Asian society (Malaysia in each case) is close to 150 score points representing 1.5 standard deviations.

There is no explanation for this divide in the report, although there are some general attempts to assess the impact of structural variables (e.g., resources available to education) on reading achievement (p. 65). Most high performing East Asian societies (the exception is Taiwan) expend more than the OECD average on education (although Mainland China does not seem to be included in the analysis) and most of the low performing countries (the exception is Brunei Darussalam) spend below the OECD average (p. 65). The association is not causal, and it is not perfect. Taiwan scored above the average OECD but spends below the OECD average while Brunei Darussalam spends above the average and scores below. In any event, understanding that the availability of resources maybe associated with learning outcomes is a very small step in understanding this regional education divide. In addition, this divide has also been revealed in another study with a quite different focus.

Chow and Kennedy (2014), using data from the 2009 International Civic and Citizenship Education Study (ICCS) (Schulz et al., 2010) examined students' intentions for future civic participation in Taiwan, Korea, Hong Kong, Indonesia and Thailand. They were asked specifically whether they would engage in various forms of protest (legal and illegal), in elections, in other forms of civic participation and in informal kinds of participation. They identified at one extreme those they called "Active Participators" (meaning participants in this group scored highly on each of the different forms of participation), with 10% of students from East Asian societies falling into this category and 33% from South East Asia. At the other end, they identified "Minimal Participators" (meaning participants in this group scored at the low end on each of the different forms of participation) 35% of whom were from East Asia and 10% from South East Asia (p. 481). The study suggested that these contrasts should be followed up in subsequent research as no explanation was attempted (p. 480). Yet, taken together with the PISA results reported above, it does seem that intra-regional variations, across broad subject areas, are part of the make-up of the region. To date there has been very little explanation for these variations although there have been some scattered attempts to understand better the educational dynamics across the region.

Kennedy (2012) compared Hong Kong and Thai students' civic values and their relationship to civic knowledge. Several results stand out, although they perhaps raise more questions than provide answers. Thai students' attitudes to religion were negatively related to the level of civic knowledge. The latter was relatively low in terms of the ICCS results thus establishing a negative association between religious values and civic knowledge. For Hong Kong students the reverse was true – their civic knowledge score was relatively high and the association with their attitudes to religion was negative. In relation to democratic values while Hong Kong students scored relatively highly on these values, they did not have any effect on their level of civic knowledge. The reverse was true for Thai students with their democratic values showing a positive association with their level of civic knowledge. In neither case are these associations causal and since ICCS is a cross sectional survey it does not indicate that the measurements are repeatable. Nevertheless, the differences revealed here are important and they did lead to further work of a qualitative nature seeking in particular to understand the values and attitudes of Thai students.

Kennedy (2014) reported the results of interviews with three groups of secondary students in Northern Thailand. Religion was clearly important to students in each of these groups but so too were families and friends. At the heart of each of these relationships was a concern for morality and for the development of "good people" and "good deeds and actions". Family members were trusted but, they needed to be "good people" and it was the same for politicians, in whom there was not a great deal of confidence. The requirement for a "good politicians" was that they needed to be a "good people". The moral concerns of these students is likely the product of their religious engagement and family values. They understand the importance of the civic in the sense that they had ideas about how political projects could achieve important things for the nation. Yet it seemed that their focus was on the morality of "good works" rather than the politics necessary to achieve them.

These analyses only start to paint a picture of complex social, political and cultural values. It takes us further than the somewhat bald results of ICCS, 2009 (Schulz et al., 2010), yet it is still incomplete. Much more work like this is needed to unfold the intricacies that underpin the civic values of students in South East Asia and therefore help us to understand better the regional education divide between East and South East Asia.

The form such work should take is important to consider. There is little doubt that surveys similar to PISA and ICCS can help to highlight issues and point to new ideas. Their quantitative methodology ensures large samples, good designs, relevant questions and easily interpretable results. Yet these results are limited in providing deeper explanations for the complex phenomena referred to above. There needs to be a new program of qualitative research that will enable countries, and groups of countries, to explore significant issues related to the education of young people. Whether it is the impact of resources, the influence of cultural values, the impact of poverty, gender stereotypes or racism, these issues need to be explored in depth with respect to their influence on education. Western explanatory models are not always relevant for the region and models developed for East Asian students may not be relevant for students in South East Asia. Research needs to be grounded in the local, as only qualitative research can be. Such research needs to be a priority for the future if we are to understand better the intricacies of a region that affects the lives of millions of young people every day.

Civic and social education

While the international testing regime has focused largely on mathematics, science, reading and technology (with ICCS being the exception), at the regional level there has been a broader interest in social education (Kennedy 2021a,b; Kennedy et al., 2014; Grossman and Lo, 2008; Kennedy et al., 2010; Grossman et al., 2008; Lee et al., 2004). The motivation for this extensive collection of work was to explore the distinctiveness of regional approaches to social education, identify commonalities and differences and reach a better understanding of regional constructions of social education. Attempts were made to be inclusive but not every country in the region was included in this work. Several articles focus on the Pacific Islands but the bulk of the work highlights issues in East and South East Asia, although there are some notable exceptions including Laos, Cambodia, Nepal and more. Nevertheless, this collection took seriously the notion of the Asia Pacific and attempted to understand how it provided social education for its young people. Several issues stand out.

Across the region there are school systems many of which owe their origins to the colonists of earlier periods. At the same time traditional values that preceded colonialism still survive (Kennedy, 2021a) meaning that present day nation states continue to engage with the issues of modernity often fueled by value systems that are thousands of years old. These values are often given expression in the religions of the region whether it is Buddhism in Thailand and Myanmar, Islam in Indonesia and Pakistan or

Hinduism in India. In addition there are major philosophical systems such as Confucianism that is an important influence in many East Asian countries. The religious values often find themselves in schools, unlike the secular education so often found in Western contexts, and if these values not reflected in schools, students will encounter them in their homes and in the community. Thus young people in the region are likely to carry with them these traditional values as well as the values of their modern globalized societies.

As students these young people will confront in school a curriculum structured along lines similar to those in Western countries – Mother tongue language, Mathematics, Science, Physical Education, Creative Arts and Social Studies. The latter in secondary schools is likely to be discipline based rather than integrated (although there may be integrated forms of Social Studies in primary education (Kennedy, 2021a,b)). The focus of social studies education across the region is likely to be nationalistic in nature. It will highlight the importance of the nation state, especially in the post-colonial environment that characterizes so many countries in the region. To this end there is also likely to be an emphasis on what is often referred to as 21st century skills (Kennedy, 2021a) since these nation states not only need to assert their post-colonial identity, they also need to engage in the challenges posed by economic and social conditions of the 21st century. Social studies education in different contexts is designed to help students with these future challenges.

Accompanying programmes of social studies education across the region there is likely also to be a subject referred to as Civic Education or Citizenship Education or Moral Education. As has been shown on multiple occasions (Kennedy et al., 2014; Grossman and Lo, 2008; Kennedy et al., 2010; Grossman et al., 2008; Lee et al., 2004) the focus of these programmes is likely to be more moral than civic with a focus on preparing the “good citizen”. While similar subject names are used in Western contexts, regional variants are more likely to follow traditional values that seek strong versions of social cohesion around a set of moral values. This is one of the key characteristics of school based citizenship preparation programmes in the region (Kennedy and Fairbrother, 2004).

Despite the generalizations outlined above, the diversity in providing social and civic education should not be underestimated. Kennedy et al. (2014), for example, provided the opportunity for Mainland Chinese scholars to discuss citizenship education in their unique context. Most often citizenship education is considered in terms of democratic political systems, but China provides an example of how single party systems seek to prepare future citizens. The examples provided leave little doubt that the Chinese state is as serious about citizenship preparation as any democratic society. But China is not preparing democratic citizens – it is preparing citizens who will support socialism with Chinese characteristics. This disrupts any notion of social cohesion across the region and reflects part the region’s diversity.

On the issue of diversity and citizenship, the Pacific Islands provides a different example from the one above. In the 21st century, countries like Fiji had a British colonial legacy on one side and the pressure of foreign aid donors on the other (Koya Vakauta, 2011). Citizenship education was a relatively new requirement for Fiji schools and the form it was meant to take under the influence of Australian and New Zealand aid donors was the traditional civic literacy approached based on political institutions and values. Yet scholars such as Thaman (2004) pointed out that citizenship education in the Fiji context was more than civic literacy. Koya Vakauta (2011) used terms like “being Fijian” and “belonging to Fiji” (p. 77) to indicate that there are indigenous values that underpin life in Fiji and these are as important as the democratic frameworks neo-colonialist nations wished to impose. This view was not about rejecting democracy, but rather about recognizing local values as the basis for citizenship and consequently citizenship education. The concept of understanding cultures and meaning in the Pacific Island context was a theme running through Thaman’s work over a long period of time (Thaman, 1997, 2004, 2008, 2009). She highlighted the importance of decolonizing thinking about the Pacific and highlighting indigenous values as part of the development of modernity in Pacific Island countries.

The emphasis on values in Pacific Island thinking about citizenship and citizenship is consistent with views in East and South and South East Asia. Epistemologically, Pacific Island values, as proposed by people such as Thaman, are different from those elsewhere. Christianity, brought to the Islands by the different colonial powers, has exerted a significant influence claiming he majority of adherents across the sub-region. Yet, as Dickie (2005) pointed out, “for many of those indigenous to the Pacific Islands region, seeing nature as sacred is still very prevalent. They continue to maintain great pride in their language, culture, and land, and they still hold strongly to the traditional myths and practices” (p. 1). Just as in the other parts of the region, older value systems remained even when overlaid by colonized values and so-called modernization processes.

Kennedy and Fairbrother (2004) pointed out that while globalization has been a major influence across the region the societies within it “are resilient and their values are deeply held. Citizenship education has been an important means of sustaining these values and ensuring that future citizens are aware of them” (p. 300). On account of its political system, China has been able to do this more successfully than the Pacific Islands. Western liberalism has been challenged in this way different parts of the region and this is often reflected in school programmes of social and civic education.

Asia-Pacific geographies as pathways for student mobility

According to the UNESCO Institute for Statistics, 2021, Australia currently acts as host to 444,514 international students representing 8% of the total number of mobile students in the world. The top 12 country/society sources of these students are in Asia (China, India, Nepal, Vietnam, Malaysia, Indonesia, Pakistan, Hong Kong, Sri Lanka, Republic of South Korea, Singapore and Thailand) representing around 75 % of the total. A small number, representing 0.09% of the total, come from the Pacific Islands (Fiji, Solomon Islands, Papua New Guinea and Tonga). In return, there are 13, 319 Australian outbound students with the top five destinations being the United States, New Zealand, the United Kingdom, Germany and Canada taking 78% of the total. Only 4.6% of these outbound students go to universities in the region (Japan, Republic of South Korea and Malaysia). These internationalization

processes, therefore, are quite unequal. Not only is there very little reciprocity between Australia and Asia-Pacific countries in terms of student exchanges, but Australian outbound students make up just 3% of incoming students. This is an issue that has both policy and theoretical dimensions.

From a policy perspective it is clear that for the Australian government and its universities the economic aspect of international education most likely outweighs the intercultural benefits of student mobility. Rizvi (2011) pointed to the influence of neoliberalism on Australian international student policy. In this context, the internationalization of higher education becomes business tool to attract full fee-paying students than for intercultural development. In 2018, the top three countries from which students came (China, India, Nepal) contributed \$18.4 billion to the Australian economy in what were referred to as "education related travel services exports" (Department of Foreign Affairs and Trade, 2019, p. 11). There is little doubt that Australian universities provide intercultural opportunities for Australians and students from Asia and the Pacific. Yet the internationalization of higher education is a business in a neoliberal economic environment and the country's fourth largest export industry (Brumby, 2021). Across the region, however, there is an attempt to create multiple destinations for the Asia-Pacific's mobile students.

Kuroda et al. (2018) referred to the "Asianization of Asia" by which they meant the intra-regional mobility of students. Two-way student flows between Japan, China, Korea and ASEAN countries account for an increasing number of students remaining within the region (p. 27). The numbers by no means match the student flows to Australia (or to areas outside the region such as the United States and the United Kingdom), yet they do show a developing reliance on the regional rather than the international. Structures such as University Mobility in Asia and the Pacific (UMAP) and The Asian Universities Alliance (AUA) show the determination of regional players to focus on intra-regional mobility to make the region a beneficiary of student mobility rather than entities outside the region.

Whether this focus on redirecting regional student flow within the region rather than outside of it is motivated by any more noble reasons than the pure business motives of Australian universities and their government is an issue that has not been widely discussed. Overall, the general literature tends to suggest that the main reason for seeking education outside of the home country is for human capital purposes (Kaushal and Lanati, 2019). There is at times an interest in migration, but there is very seldom mention of intercultural sensitivity. It is also of interest to note that the chief proponents of intra-regional student mobility are the economically developed nations of East Asia (Japan, South Korea, China) whose concerns are as much about their knowledge economies and neo-liberal policies as their equivalents in the West. One exception to this is Malaysia where in bound student flows from countries like Indonesia and the Middle East based on religious compatibility is a chief pull factor (Luo, 2017). This new area is neglected by Western researchers and further work is necessary to understand the policy and theoretical implications of students moving within the Asia-Pacific rather than outside it.

Conclusion

The Asia-Pacific as a construct has changed overtime largely because of the influence of those external or at least peripheral to the region. No matter how conceived, it is diversity rather than uniformity that characterizes the region whether the focus is on religion, social systems, political systems or educational achievement. There is some commonality in the social aspects of the school curriculum and citizenship education. Yet unlike in the West, however, the focus of the latter is not so much on institutions and structures as in producing "good citizens".

In the 21st century structures have emerged to try to mold a regional identity not so much to keep outsiders out in these globalized times but to ensure that those in the region can play a proactive role in rapidly changing economic times. What is needed in the future is a research agenda that will help to develop greater understanding of the region, its values and its priorities. The marginalization of Pacific Islanders and their values in the light of neo-colonial aid donors is an issue of considerable importance to issues of equity and equality in the region. The same issue applies to those countries outside the East and South East Asian orbit, most of which have not even been mentioned in this review article. In its most recent guise as the Indo-Pacific security region, there remains much that is unknown outside of the so-called security priorities. There is much to learn about the people who live, work and develop their lives across the region's breadth. In the end it is such people who represent the region rather than the constructions placed on it by external forces.

Regional background

The diverse pattern of education in South-East Asia is composed of a rich mix of colonial legacies, post-colonial ambitions, growth and development, governance, and its growing importance as a world region. Embracing the world's most populous Muslim-majority nation (Indonesia) with a total population of 270 million, and some of the smallest (Brunei, population 441,000), the region is an opulent blend of religious traditions (Islam, Buddhism, Hinduism, Christianity and local spiritualism and pantheism), some of which spawned important educational initiatives. The Khmer empire developed important centers of Hindu and (Theravada) Buddhist learning at Angkor Wat's famed temples, built in the first half of the 12th century and replete with substantial libraries (Hayhoe, 2019), while the grand Buddhist temple of Borobudur, built in the 8th to 9th centuries by the Shailendra dynasty of Java, featured an architectural design based on a cosmology offering an ascending path to enlightenment. Catholic missionaries who pushed into current Philippines and Việt Nam, developed schools and universities, while in Burma (now Myanmar) the Baptist Judson College became part of the new Rangoon University (now Yangon University, ရန်ကုန် တက္ကသိုလ်) in 1920. The Confucian system of ethics, including the core principle regarding the value of knowledge and self-cultivation, was the basis of higher learning and governance in Việt Nam for something like a thousand years, and its heritage is still tangible in today's Singapore (Welch, 2019).

Religious influences remain substantial: in both Brunei and Malaysia, for example, Islam is the state religion, while in neighboring Indonesia, a separate Ministry of Religious Affairs (MORA) continues to administer Islamic schools and higher education institutions (HEIs). In Myanmar, monastic education based on Theravada Buddhism survives, if mostly for the poorest. The relative independence of monastic education, however, allowed it to introduce innovations that were, at times, subsequently taken up in the public sector. In this instance, this meant that "... children from the most disadvantaged background ultimately had access to better teaching practices than those at government schools, as a result of the work pioneered in (monastic schools)." (Lall, 2020: 101).

Diversity

The multi-faceted jewel of South-East Asia displays a wide range of development levels, political systems, languages and ethnicities. Overall population in the region totaled 660 million in 2020, with regional GDP reaching US\$3.2 trillion; collectively, this made it the 10th largest economy in the world (ASEAN, 2020). While, on average, services, including education, comprise around half of the regional economy, with both industrial and agricultural sectors declining in proportional terms, the share of the national economy that the service sector occupies varies widely from 39% (Việt Nam) to 65% (Singapore). (ASEAN, 2020).

Political systems vary substantially, from monarchies (Thailand, Brunei), to various forms of military regime (Thailand, and Myanmar, previously called Burma), strong-man authoritarian regimes (Philippines, Cambodia), single-party socialist market economies (Việt Nam, Laos), and guided democracies (Singapore). Education is considered important throughout the region, and families may often make considerable sacrifices to send their children to the best education they can afford. This may often involve significant additional payments for private extra-school classes, after hours.

National identity

National identities remain strong, and are promoted within the education system, for example in Indonesia's *Pancasila* (Five Principles). But national identities are also challenged by the strength and persistence of local affiliations, languages, and ethnic ties that at times transcend national borders. Linguistic diversity is a feature of several systems, with Indonesia alone, for example, featuring 300 languages (including the national language Bahasa, spoken by 200 million as their second language). At the same time, efforts to promote a trans-national regional identity based around the 11-member Association of South-East Asian Nations (ASEAN), founded in 1967, are ongoing, including via regional mobility programmes such as ASEAN International Mobility for Students, and the EU's SHARE scholarship program that offers scholarships to study in an HEI within ASEAN. A further pan-ASEAN feature is the adoption of English as the official language of ASEAN. In practice most countries permit non-dominant languages as a medium of instruction.

The politics of ethnicity can shape educational outcomes. In Malaysia, Chinese-Malaysian families overwhelmingly send their children to Chinese medium schools, while at the higher education level, ethnic quotas, formally abandoned in 2003, still mean that, in practice, Chinese Malaysians and Indian Malaysians have limited options: private higher education, or a university overseas. Students from Tamil or Chinese medium schools who cannot demonstrate sufficient proficiency in the national language must enroll in a one year transition class, since *Bahasa Melayu* is the official medium of instruction at the secondary level (UNESCO, 2014b: 30–31).

Inequality

Participation rates, particularly at secondary level, have risen in recent decades but vary appreciably. Secondary school net enrollment ratios (NER) vary from 35% in Laos to 99% in Singapore. No ASEAN member state has an NER of less than 90% at the primary level. (ASEAN, 2020: 15) Substantial levels of inequality in education have been exacerbated by neo-liberal forms of globalization in recent decades, and deepened by successive shocks such as the regional currency crisis of the late 1990s, the Global Financial Crisis a decade later, and the COVID pandemic of 2020–21. Gini co-efficients, (a widely used measure that charts the degree of income inequality in a society) that were already high (mostly around 0.40 or so in 2019), worsened in response to COVID. In many systems, the effects pushed millions of families, especially from the informal economy, back into poverty, with severe consequences for school participation. UNESCO data on the effects of the COVID-19 pandemic revealed widespread school closures, and the number of out of school children worldwide rising to around 9% of total learners, or 157 million individuals worldwide. The consequences within South-East Asia were profound with estimates that 68 million children were affected in Indonesia alone, with a further 15 million in Thailand and 10.5 million in Myanmar (UNESCO, 2021a).

Colonial legacy

A kaleidoscope of colonialism has marked the region, including in education. Dutch colonialism shaped education in Indonesia, British colonialism helped structure education in Malaysia, Myanmar, Brunei and Singapore, while French colonialism molded education in Cambodia, Laos and Việt Nam (Symaco, 2013). The post WWII era saw progressive de-colonization across the region, with Indonesia declaring independence in 1945 (although sovereignty was not formally transferred from the Dutch until 1949), Laos and Cambodia in 1953, and Malaysia in 1957. But in some cases, the independence struggle took much longer. While Việt Nam's Ho Chi Minh declared independence from the French immediately after the Japanese surrender in 1945, a united Communist state was not achieved for another 30 years. Thailand was the only country in the region not to have been colonized, although still subject to significant external influences.

But the colonial legacy was not easily overcome, and the challenge of building national education systems was compounded by the post-independence departure of many colonial administrators and educators, depriving the local system of much-needed experience and specialist skills. New curricula and textbooks were needed, as well as many new teachers. Moreover, education ministries tended to be reluctant to cede much control to either institutions or to trans-national initiatives. While pilot projects were cautiously introduced in Indonesia, for example, to accord more autonomy to select universities, to this day in Myanmar, "Everything is very centralized and the universities have hardly any autonomy." Lall (2020: 134).

Demographic challenge

An added challenge was demographic: a burgeoning youth population profile that remains common to the region, imposed substantial demands on nascent national systems of education. A current population cohort of 213 million youth (15–34 years) in ASEAN countries, is the largest ever, and is expected to peak at over 220 million by the late 2030s (ASEAN, 2017). The high proportion of the overall population aged under 15, that ranges between a quarter and a third for almost all ASEAN member states, ensures major ongoing demand for schooling, while growing levels of wealth and aspiration underpin rising demand for higher education, at times of uneven quality (ASEAN, 2020; World Bank, 2020a). Rising aspirations for education, and in several cases a swelling middle class, add to aggregate demand for education, in both quantitative and qualitative terms.

Dropout: forms and problems

But equity issues persist. Dropout rates continue to be a problem in Laos, Việt Nam, Cambodia and Myanmar, especially at the secondary stage, and particularly among the poor and rural youth. In Myanmar, over half of the wealthiest 20% of the population had either completed secondary or gained higher qualifications and only 7.5% had never attended school. But for the poorest 20%, the ratio with secondary or higher qualifications was less than 4%, while 30% had never attended school (Republic of Myanmar, 2014). In Cambodia, 84% of children complete primary school, but only 20% complete the secondary stage, with a dropout rate from lower secondary to upper secondary of 27.5% (SEAMEO, 2017: 43). In Myanmar, rates of attendance fall from 80% at age 11 to 36% at age 16, and one in six children who should be attending primary school were not enrolled (Republic of Myanmar, 2014). Regional variations are also substantial with the rate of those who never attended school varying from 1.7% in the national capital region (Naypidaw) to 21.9% in Shin, 10.1% in Kayin and (a claimed) 5.5% in Rakhine (Republic of Myanmar, 2014, see also Lall, 2020: 29). Across the region gross enrollment ratios at secondary level range widely from 42 to 108% with an average of 77%. By contrast, gross tertiary enrollment ratios range from 11 to 21%, with the regional average being 18% (ASEAN, 2017: 27).

Education and decentralization

The most common age at which schooling begins in the region is 6. Most ASEAN member states feature 6 years of primary schooling, often with 3 + 3 at the secondary level. The systems in both Laos and Việt Nam systems operate on the basis of 5 years of primary schooling with 4 + 3 at the secondary level (UNESCO, 2014b: 12). With the exception of Myanmar and Laos, where only 5 years of schooling is free and compulsory, all other ASEAN systems mandate at least 6 years of compulsory and free schooling. (UNESCO, 2014b) Governance and administration tend to remain rather centralized, especially regarding primary source of funds, quality control and standards and teacher administration, despite varying degrees of decentralization instituted across the region in recent decades, via laws or regulations. Standard setting tends to be centralized, but in Việt Nam, for example, teacher recruitment may be devolved to the Province or District level, while in Indonesia, which introduced a substantial degree of decentralization in 1998, most teachers are selected and paid by local government. At the local levels, various issues such as underfunding, lack of capacity, and accountability are problems in systems such as Laos, Việt Nam and Myanmar.

Financing of education

The proportion of public spending on education as a percent of total government spending varies widely, from less than 5% in Myanmar, to over 22% in Thailand. For the years 2007–2010, public expenditure on education as a proportion of Gross Domestic Product (GDP) ranged from less than 1% in Myanmar, to almost 6% in Malaysia, although the latter figures is somewhat misleading, since much of the funding is concentrated on educational institutions dominated by *Bumiputra* (ethnic Malays). (UNESCO, 2014b: 9) For some states, the financial burden of catering to the growing demand for education (among numerous other competing demands on the state purse) is challenging, and together with varying traditional levels of state provision, leads to rising levels of private educational supply (UNESCO, 2021b; Welch 2021). As well, state educational institutions may be under pressure to respond to rising demand under conditions of constrained state budgets, which leads to varying degrees of privatization of public sector educational institutions. State capacity, too, varies widely from wealthy, sophisticated Singapore, to Myanmar, which is still rebuilding an education system that was neglected for decades. Systems that spend higher proportions of their budget on education as a proportion of Gross Domestic Product (GDP) also tend to have greater capacity and stronger quality assurance systems, as well as more robust teacher training systems and better teacher remuneration.

Corruption

Corruption is a substantial issue throughout the region and is linked to both governance, state capacity and finance. Afflicting most parts of the economy, the education sector is by no means exempt, and the phenomenon reduces available funding and undermines both quality and equity of schools and universities (Fig. 1).

Transparency International's Corruption Perceptions Index (CPI) ranks and rates 180 countries on a 1–100 scale, with 1 representing wholly corrupt and 100 being wholly free of the taint of corruption. With the notable exception of Singapore, the data below reveals significant levels of corruption in several ASEAN member states. Specific forms of corruption in education range from cronyism in appointments and promotions, to the sale of positions, bribery, sexual abuse of students (for admission, or higher grades), fake qualifications, and research problems such as plagiarism and fake results. (Welch, 2020).

Country	Country Rank	Corruption Score
Singapore	3	85
Malaysia	57	51
Indonesia	102	37
Thailand	104	36
Philippines	115	34
Việt Nam	104	36
Myanmar	137	28

Public private balance

Limited state capacity and tensions between rising demand and limited state finances has resulted in a varying balance between public and private sectors in South-East Asian education systems. Some systems have long had private sector establishments, both schools and higher education institutions. In many cases, their origins relate to missionary activities: the Philippines' Santo Tomas university, founded in 1611 by the Archbishop of Manila, has a genealogy longer than Harvard's, and there were also Catholic schools and universities in the south of Việt Nam, at least until re-unification in 1975. (Welch, 2011; 2021) Driven by increased urbanization, the decline of the extended family, limited state capacity, demand for English language instruction, the growth of the middle class, and increased interest in an international education, current estimates are that spending on private education in South-East Asia totals around US\$60 billion. (EY nd).

But the growth of the private sector has not always been well regulated. In a number of systems, private sector enrollment growth has outstripped public sector growth rates. The proportions within ASEAN education systems vary significantly, however; private schools account for 42% of the total in Indonesia, but only 9% in neighboring Malaysia, 25% in the Philippines, and 2% in Cambodia. Rates of private provision also vary by level, with the share often higher at higher levels (UNESCO, 2014b: 17, World Bank, 2020b; EY Parthenon, 2018). In Laos, the private sector is an important component of educational provision at all levels from pre-primary to higher education (SEAMEO, 2017: 92).

The share of total enrollments held by private sector higher education institutions (HEIs) also varies widely across the region: from around 15% in Việt Nam to around 66% in neighboring Cambodia. In Indonesia, the region's largest system with more than 8 million higher education enrollments, the private sector share is 62% (UNESCO, 2014a) But because private HEIs are much smaller on average, some with as little as 100 enrollments, and many with 500 or so, their share of institutional totals is exaggerated (Welch, 2021). In general, quality is higher in the public sector, although in Indonesia and the Philippines a small number of private HEIs vie for equivalent leading status with leading public HEIs. Rates of private spending as a proportion of total expenditure on education also vary significantly, by country and level, with private expenditure at the tertiary level accounting for more than half the total in Indonesia and two-thirds in the Philippines (UNESCO, 2014a: 18).

But the relatively faster growth of the private sector in a number of systems, at least in higher education, is only one side of the Janus face of privatization. The fact that growing pressure on demand for schooling and higher education has often not been matched by equivalent increases in state funding has put additional strains on public sector educational institutions. Governments remain keen to have more and more young people in education; but are unwilling or unable to match such increases with equivalent increases in financial support. The increasing gap between enrollments and finance places extra strain on public sector educational institutional finances. In order to shore up their bottom line, some HEIs in the region resort to dubious practices, such as lowering admission standards, enrolling more students than their allocated quota, accepting bribes to gain a place or for a higher grade, turning a blind eye to fake qualifications, illicitly granting degrees without the requisite work, and mounting similar courses for high fees in parallel private institutions, at times with uncertain financial transparency. The combination of rising fees at public HEIs, and significant fees at private HEIs, often of poorer quality, narrows options for some parts of the populace, and can mean that poor families may ultimately pay more for an inferior education.

Regionalism

While the national administration of education systems remains strong in practice, some decentralization has occurred, for example in Indonesia after 1998. Perhaps in part a response to a history of colonialism, countries within the region tend to be reluctant to cede much authority to regionalism. Nonetheless, programmes to foster a greater sense of regional identity, at both school and university level, are part of the ASEAN educational agenda (ASEAN, 2017; 2018). Schemes at the higher education level tend to be better developed and include the ASEAN University Network (AUN) of 30 HEIs across the region, the EU-ASEAN Support to Higher Education in the ASEAN Region (SHARE) scheme, and the South-East Asian Ministers of Education (SEAMEO) ASEAN International Mobility for Students (AIMS) program, administered by SEAMEO's Regional Institute for Higher Education (RIHED). For systems such as Myanmar, poor and underdeveloped after decades of neglect, such programmes have been of particular importance; by 2018, Myanmar had helped select 148 students for study in other ASEAN systems, while also hosting 17 in Myanmar.

But there are also wider links that arguably extend the notion of region. For many of the countries in the region, China is their major trading partner. Several, notably Singapore and Malaysia, have substantial ethnic Chinese minorities, which across the region

exercise a disproportionate economic influence. A second link derives from the fact that China borders several South-East Asian states, notably Myanmar, Laos and Việt Nam. Ethnic groups such as the Dai, Wa and Kachin straddle China's border, and universities on China's Southern border regions, for example, have long had connections to Việt Nam. Overall, education links between China and ASEAN have also grown significantly, including via more than 30 Confucius Institutes located within ASEAN, each of which is in the form of a bi-lateral agreement between a Chinese and an ASEAN university. But other networks have been expanded, too: subsequent to a bi-lateral *Memorandum of Understanding on an Academic Cooperation and Exchange* being signed in 2007, the AUN network now extends to several Chinese universities. The agreement included 13 Chinese HEIs and an equivalent number of ASEAN HEIs, as well as national representatives from each side. Numerous Confucius Classrooms also exist in the region, with Thailand hosting 20, for example, while China awards thousands of international scholarships to enable ASEAN students to enroll at its universities. Another extra-territorial link consists of links with Australia, where tens of thousands of students from ASEAN have long studied. Research collaboration between countries such as Singapore, and Malaysia, with Australia, also continues to grow. (Finnane, 2021; Welch, 2014a,b).

Teachers and university faculty: training and qualifications

Qualification levels for admission to teacher training vary somewhat across the region: most systems require Year 12 graduation, but Brunei Darussalam, Laos and Myanmar accept students with either Year 11, or Year 10 qualifications. Teacher training programmes vary in length, but higher levels of qualification are usually needed for secondary teachers. While teacher recruitment has mostly been devolved to provincial, or district level, Singapore, Malaya, Cambodia and Myanmar adhere to centralized recruitment schemes. Programmes are often of two years duration for primary school teachers and three to four years for secondary. In rural areas, teachers tend to be less qualified, and some are not registered or accredited. Efforts are ongoing in Malaysia and elsewhere to upgrade teacher qualifications, especially for those untrained, or with minimal education levels. Continuing professional development is a feature of several systems. Cambodian community teachers in the provinces are entitled to 16 days of professional development, for example, while Việt Nam requires teachers to engage in 30 days of in-service training per year. (UNESCO, 2014b: 20).

As with other public sector workers, teachers and academics in several ASEAN systems are poorly remunerated. Average annual public secondary school teacher salaries expressed as a proportion of GDP per capita range widely across the region, with Indonesia, Cambodia and Laos featuring the lowest proportion, and Malaysia and Thailand offering the highest. (UNESCO, 2014b: 39) In several systems, low salaries lead to varying degrees of moonlighting, in an effort to supplement overall earnings. For teachers, this often involves private tutoring (classes) after school hours, for fees. For school pupils, it is often not possible to pass the exam without participating in such out-of-hours classes, which means students from poor families who cannot afford the additional fees, are excluded and condemned to fail. For academic staff, moonlighting at private HEIs boosts their income considerably, but at the cost of reduced quality and energy at both public and private HEIs. Wealthy, highly-developed Singapore is an outlier, and awards salary increments based on performance and meeting professional standards. At the higher education level, bi-lateral agreements to recognize degrees as equivalent, such as that between Malaysia and China, aid in staff and student mobility.

Quality assurance

Quality assurance (QA) is a priority for ASEAN member states, but the effectiveness of regulation differs from system to system, depending on state capacity, and levels of development. In some systems different agencies address different levels, as with Indonesia's National Board of School Accreditation (BAN) and National Accreditation Board for Higher Education (BAN-PT). In Laos, the Educational Standards and Quality Assurance Center is responsible for QA at all levels, as is Việt Nam's General Department for Educational Testing and Accreditation (GDETA). In practice, corruption undermines the robustness and transparency of the process to varying degrees in several systems, with bribes, favors, cronyism and other nefarious practices not uncommon. Such problems weaken quality across the education system, reduce levels of available resources, and undermine public confidence in both the education and wider political system (Welch, 2011, 2020).

ASEAN's rich diversity of peoples, languages, cultures and religions is intersected by a common tradition of respect for learning, teachers and education, as well as the ambition to improve the quality of education and encourage wider participation. But sharp differences in wealth, state capacity, and quality of personnel lead to very different outcomes. The common aspiration to have at least one so-called "World Class University" provides an example. According to all the major global higher education ranking schemes, wealthy, highly developed Singapore has two, Malaysia has one, but no other ASEAN system has a university ranked among the leading 500 HEIs worldwide.

There is therefore a mix of achievement, aspiration and challenge that has differentially shaped the trajectory of individual ASEAN education systems. The rising importance of the region, the mix of persistent national identity and quest for a pan-ASEAN regionalism, cautious moves to decentralize, and ongoing problems of corruption in education will continue to shape both the regional and national form of education in decades to come.

Introduction

Given that South Asia is the most populous and most densely populated region in the world, comprising about one-fourth of the world population, it is important to analyze developments that have taken place in there as they are influenced by, and in turn, influence developments in the other parts of the world. The South Asian region, also known as Indian sub-continent, comprising Islamic Republic of Afghanistan, People's Republic of Bangladesh, Kingdom of Bhutan, Republic of India, Republic of Maldives, Federal Democratic Republic of Nepal, Islamic Republic of Pakistan and Democratic Socialist Republic of Sri Lanka, which is a vast area of the size of Europe, exhibits some important similarities and significant differences. While striking dissimilarities exist across these countries, for instance, in terms of population-- the second most populated country in the world exists alongside the world's least populated one-- geographical area, social and political contexts, economic levels of development and the size of education systems, there are major similarities too. The region shares a common heritage, culture and history, starting from the ancient period; the several countries in the region are connected not only geographically sharing national boundaries and colonial legacies, but also through similar cultural practices, and religious and linguistic diversity. India has been the central core of the region both geographically and more importantly historically and culturally. The other countries, some of which were part of India earlier, form the peripheral region, and have been influenced for centuries, historically and politically by India. The region is characterized by an immense degree of diversity within a very broad contour of unity. In terms of a multitude of features in the economic, social, and political history, South Asia has been a "mini world," suggesting "about the early 'modern' world economy" (Washbrook, 1988).

The countries also face comparable challenges and problems in many spheres, including in education. Any discourse on how the landscape of education has evolved in the countries of South Asia over the past several centuries clearly speaks of a decline of a highly evolved knowledge society and a robust educational system, one of the most ancient civilizations in the world that used to be rich not only in its treasure of scriptural knowledge and practices, but also one that nurtured and inspired indigenous knowledge in the fields of science, mathematics, technology, engineering and medicine into a highly disintegrated irrelevant system. Knowledge and knowledge systems typically evolve over time implying that there is a gradual progress in not only in ways that knowledge is produced and disseminated, but also in the ontological meaning of the term, knowledge is redefined. Speaking of knowledge systems and education in the context of South Asia, one cannot but note that there has been a radical displacement of what defines knowledge and education by dominant Western systems. The Western systems have refused for long to acknowledge the contributions of scientists and mathematicians of the ancient India like those of Bouddhyana (for the discovery of several concepts in mathematics, including calculating the value of phi), Aryabhatta (known for his contribution of zero, as well as his discovery of the curvature of the earth and the fact that it rotates on its axis around the sun, the solar and lunar eclipses, the duration of a day as well as the distance between the celestial bodies of the earth and moon, etc.), Pingala (for using binary values), Acharya Kanad (for atomic energy), Bhaskaracharya (for his work on differential calculus), Varahamihira (for his contributions to astrology, hydrology, geology, ecology, including earthquakes and the concept of gravity), Brahmagupta (for the concept of gravity), Nagarjuna (for the doctrine of emptiness), Charaka (for Ayurveda – Indian medicine), Shusruta (for surgery, including plastic surgery), and Patanjali (for yoga). There were also many great authors of monumental literary and spiritual works of immense value. Ancient India laid the foundations in many areas of knowledge; particularly in mathematics, science, logic, medicine, psychology,

spiritualism and ethics, besides social and cultural studies, law, and language and linguistics. A closely related area refers to the great Indian engineering knowledge demonstrated in many constructions of the past 1,000–2,000 years in south Asia, which is not acknowledged in modern knowledge systems either (Tilak, 2022). The region once known as *Visvha Guru* in knowledge development and dissemination, has become the most ignorant and illiterate society. This is attributed to several invasions and the long colonial rule that most countries in South Asia endured, which uprooted “the beautiful tree” (Dharampal, 1983) and transformed an advanced intermediate society of India into an illiterate society, besides converting it into a raw material appendage on the economic front. The result of sustained colonial oppression was that the region sunk into abysmally low levels of literacy with high levels of human deprivation, shattered social and cultural structures and a ruined economy. As a result of continuous efforts made by the countries since the fifties of the twentieth century when they became independent, the several countries have come back gradually to the path of rebuilding their nations, even though they continue to face serious hurdles in their endeavor to achieve progress. Education is one such area where one finds paradoxically impressive growth along with mounting anomalies. As is the case in most other countries of the world, globalization, the present wave that started in the early 1980s, has dramatically impacted the landscape of education in South Asia.

Even before the present wave of globalization commenced, South Asian countries and their education systems have been seriously inflicted after independence, by conflicts based on differences in ideologies, religion and ethnicity. Some of them still continue to suffer. The ethnic war in Sri Lanka between the majority Sinhalese and the minority Tamils lasted for 26 years till 2009 resulting in a loss of countless lives and stress for the economy. The impact of the dispute was seen in different aspects of education beginning with school education, text books, higher education and the quality of teachers. During the colonial time of “divide and rule”, British favored the Tamils who venerated education and did not have much resistance to studying in English medium Catholic schools. Consequentially, a lot of them made it to higher education in good numbers. Several studies (e.g., Perera, 2001) provide detailed accounts of how the Tamils had progressively occupied majority of the positions in administrative services, railways, postal services, armed forces, law, medicine etc. Threatened by this, the Sinhalese government soon introduced education policies and schemes that majorly benefitted the Sinhalese, such as making Sinhalese the only official language, highlighting Sinhalese history, culture etc. in text books and favoring Sinhalese students for admissions into higher education. The Sinhalese hegemony created further problems, leading to a long civil war thereby significantly affecting especially the lives of children and the economy. A recent study on the impact of the war on children (Lakshman et al., 2020) showed how displacement and trauma caused by the war resulted in high dropouts and loss of interest in studying among children in the Northern Tamil region; impact that had both immediate and long term effects.

The religious conflict between India and Pakistan that led to their historic partition in 1948 post-independence has also severely damaged education in Pakistan and Kashmir in India. Pre-occupied with war against India over Bangladesh initially and later over Kashmir, Pakistan’s educational system suffered with very poor infrastructure and access. On the other hand, education in Kashmir remained disrupted due to constant tension and conflicts. Bangladesh, after its independence from Pakistan in 1971 began as an impoverished country for decades and only in 2015 gained the status of a lower-middle income economy. The resilient Bangladesh economy surpassed Pakistan on many fronts and its performance in education was also impressive since human resource development was a key policy thrust of the government of Bangladesh (ADB, 2008).

Nepal had strict dictatorial rule for more than a century from 1846 and education was unavailable to the masses. Faced with severe political turmoil, a Board of Education was established as late as in 1951 after which organized educational planning was undertaken with substantial foreign aid and access to education was provided to all. Owing to severe political instability with frequent Maoist insurgencies, Nepal has not been able to make significant progress in educational indicators.

Internal conflicts due to political and ethnical differences have had huge impact on the educational trajectories that countries in South Asia have taken. The combination of factors such as crisis of governance, failure of the democratic system, decentralization of power, imbalanced intra-state and inter-state developments and increased ethnic conflicts jeopardized the South Asian system (Lahiry, 2013). Because of its vast geographical size and being economically and politically more powerful, India has dominated the region in general and in education progress in particular.

Using most recent quantitative and qualitative information on some key parameters that define educational development, such as literacy, enrollment ratios in primary, secondary and higher levels of education, out-of-school children, inequalities, and public funding, and foreign aid, the article analyses the achievements and under-achievements in education in South Asian countries and factors that have contributed to them, in a broad political economy framework, acknowledging the importance of not merely the economic factors but also of social, cultural, historical, and political factors, the roles played by divergent actors within and outside the government—politicians, civil society organizations, community members, private investors, businessmen, philanthropists—national and international, working at macro level as well as at grassroots in shaping education policies and development. After all, education is not situated in isolation; it is influenced by a broad macro environment and the prejudices and interests of various players. In turn, education influences the broader environment in a variety of ways. The article highlights the trajectory of developments in both school and higher levels of education in South Asian countries in the wake of globalization. It also discusses the major guiding principles and factors behind educational policies and strategies introduced in these countries and some paradigm shifts that have taken place in their approach toward education. As an immediate and significant fallout, the general trends on how policies have facilitated the growth of certain types of educational institutions, apart from discussing the global dynamics and connections that have distorted national priorities, policies and practices. In this context, the article refers to some landmark global declarations in the field of education that have shaped national policies, which caused shifts in national priorities and changes in principles of educational planning in these countries. It may be noted that only a few select key dimensions of education development have been analyzed as in a short article of this size a comprehensive analysis of the vast area of education cannot be made.

Human development, literacy and education development

Education was always placed on a high pedestal in the history of South Asia. Education has always been valued for its own sake, recognized for the value it has added to the overall dignity of life. Numerous invasions and colonial rule devastated not only existing education systems, but also economic and political structures. Hitherto wealthy countries were transformed into less or least developed countries. The high-standing that education had enjoyed could not be restored even after independence. After Independence, the countries of South Asia struggled to revive their economies and re-build their educational systems. Economically, one can argue that all the countries in this region are still “developing”, though some like India have experienced high rates of economic growth over the last two-three decades, and have been aspiring to enter the group of “upper middle-income” countries soon, and eventually the group of “high-income countries”. At the same time, whatever has been the economic growth and modernization, they got confined to a few urban areas in the countries, showing a very high degree of rural-urban inequalities within the countries.

Countries in this region have had more than their share of strife. Political turmoil, wars with neighbors, internal civil war and unrest and coups have not been unknown. These are in addition to ethno-religious and sectarian type conflicts, some of which have cross-border implications. Some of these are actually legacies of the colonial rule. Today the region is also one of the tensest regions in the world with two nuclear power nations at loggerheads all the time. Politically the region is marked by federal and unitary structures; multi-party political democracies, martial rule and also constitutional monarchies. It is also characterized by a high degree of religious diversity--the region has the largest population of Hindus, Muslims, Sikhs, Jains and Zoroastrians in the world. Apart from accounting for more than 90% of the world's Hindus and Sikhs, the region is home to 31% of the world's Muslims, 35 million Christians and 25 million Buddhists. The region is also one of the most linguistically diverse areas of the world containing four major language families and more than 650 individual languages, though only a few dozens of languages remain “functional”. With respect to political administration, decentralization has become an important development strategy not only in large countries such as India and Pakistan, but also in relatively smaller ones like Nepal.

The poverty ratios are high, in many countries of the sub-continent, with many countries following divergent strategies to reduce penury, with varying degrees of success. On the whole, South Asia has some of the worst human development outcomes of the poorest population quintile in the world. Except Sri Lanka and the Maldives, all the countries of this region score badly in the overall Human Development Index, though in the total list of 189 countries in the world, they are described as “medium human development countries” (Table 1). A special mention may be made of Bhutan, a tiny Himalayan kingdom, which is best famous internationally for its development philosophy of “Gross National Happiness” initiated in early 1970s.

Though, as has been stated earlier, South Asians have had held education in high esteem from the ancient period onwards, that regard was lost till it was partially revived by the famous “human investment revolution” propounded by Schultz (1961) in the 1960s that led many countries, both developing and developed, to re-recognize the undisputed role education has in the socio-economic development of a nation, and accordingly to invest in education, and to build or revisit their education policies with the objectives of improving access to better quality and more equitable education. It has been clearly recognized that human capital produced through investment in education (and training) is an important factor in the economic growth of South Asia countries, along with physical capital and technology. Estimates of growth accounting between 1981 and 2010, suggest that human capital has contributed directly as a productive input to about 22% of the annual gross domestic product (GDP) per worker in India. During the same period, it has contributed around 21% in Bangladesh and 16% in Sri Lanka (Asian Development Bank, 2017). Even though the momentum that was created by “the human investment revolution” in economic thought suffered a break in the 1970s, the following decades witnessed the emergence of “new growth theories” (in the 1980s) that have stressed again the role of human capital in economic growth. As a result, public interest in education increased significantly, along with a rise in the commitment to universal education. This was also partly attributable to the various global initiatives

of the United Nations and others and the new thinking that has crystallized in the name of human development. Education's instrumental role as a means to socio-economic development, and its constitutive role as a measure in itself of development have been recognized (Sen, 1999). All this has led to a colossal explosion of education in the South Asian countries as also in a few other developing nations.

Beginning with literacy rates, all major indicators of education development point toward progress in all the South Asian countries after independence. It may have to be underlined that progress was made and the structures were built mostly on the firm base established by colonial rule. Indigenous systems have been completely lost or are at best existing as fringe elements in certain parts. Modern education having replaced the traditional ones, began to grow fast in all the countries of the region. South Asian countries truly witnessed in general an "education explosion". Adult literacy in the region almost doubled from 36% in 1970 to nearly 73% by 2020 (Fig. 1). Enrollments in every level of education have grown exponentially over the years. However, the growth has not been uniform, as shown in Table 2. Forty percent of adult population in Pakistan are still illiterate. Enrollments increased by 2–5 times between 1981 and 2018 in all countries except in Sri Lanka, where the growth has been modest, having large numbers in the base year itself.

Universalization of elementary education

Post-World War II, education was envisaged as a universal fundamental human right according to the *Universal Declaration of Human Rights* (1948). Article 26 of the Declaration made it clear that elementary education was to be free and compulsory and education, including higher education, was a human right. Among the South Asian countries, India, Afghanistan and Pakistan (that included the present Bangladesh) were signatories to this Declaration, along with 45 other countries. The 1990 Convention on the Rights of the Child went a step further and imposed a legal obligation on this right. Colonial India, which then included Pakistan and Bangladesh, attempted as far back as in 1910 to make primary education free and compulsory throughout the country. But this assurance could only be implemented after Independence when it was incorporated in the Constitution of India in 1950 as a Constitutional Directive which, after a constitutional amendment, was made a Fundamental Right in 2002. This right was incorporated into an Act in 2009 under the name of the Right to Free and Compulsory Education, briefly known as the Right to Education. Today, all of the South Asian countries recognize education as a fundamental right: Sri Lanka declared education as a fundamental right in 1945, years before Independence; Bangladesh in 1993; Nepal declared it in its Constitution of 1990 and via the seventh amendment in 2001; India did so in 2002 and Pakistan in 2010. The Directive Principles incorporated in the Constitutions of Bangladesh and Pakistan, like the Constitution of India (1950), aim at free elementary education but it does not carry any legal compulsions or implications. Other global initiatives, such as the World Declaration on Education for All (EFA), a UNESCO-led movement in 1990, followed by the Millennium Development Goals (MDGs), and Sustainable Development Goals (SDGs) have had an important effect on the growth of elementary education all over the world, including in the countries of South Asia.

Historically, Sri Lanka was way ahead of other countries in the education sector. As a result of early initiatives, it has achieved impressive enrollment levels in primary education. The most striking aspect seen in Sri Lanka, which like Kerala in India, is, despite a low per capita income, it could universalize basic education, ensure equity in education and better its performance with respect to indicators in human development (Tilak, 2001). The goal of education in Sri Lanka has been to promote national and social cohesion. India has also been able to raise its net enrollment ratio in primary education to above 90%. Measures of affirmative action implemented by governments, for instance, programmes like the mid-day meal scheme and the Integrated Child Development Scheme in India have proved strong incentives for children to come to school, helping them improve their academic performance. After the launch of the Education for All movement in 1990, between 1990 and 2000, “countries in the region have made good and also rapid progress on many fronts in quantitative terms—in terms of literacy, increase in enrollments, enrollment ratios (gross and also net), retention rates, gender parity, teachers and public expenditures” (Tilak, 2000; see also UNESCO, 2009). Further, as the *South Asia Sub-Region Synthesis Report* (Tilak, 2000) stated, overall the South Asia has shown remarkable progress in achieving the millennium development goal of universal primary education; and much of the credit for this goes to India as, enrollments rose in South Asia from 72% to 89% over the period 1990–2010, largely as a result of progress India made. Currently, enrollment figures in primary education in South Asia have been impressive with an above 90% net enrollment ratio, except in Pakistan, where it has been below 70% in 2018 (Table 3). In case of Afghanistan no information is available on net enrollment rate for recent years; but with 107% gross enrollment ratio in 2019, one can expect a reasonably high net enrollment rate. All South Asian countries, with the exception of Pakistan, certainly seem to be moving toward universal primary education.

Teacher has always been regarded as the pivot of an education system. Globally, school systems employ trained and qualified teachers. But over the years, particularly since the beginning of the 1990s, when most countries adopted structural adjustment policies, constrained by budgetary resources and unavailability of qualified teachers, almost all South Asian countries resorted to recruiting teachers who had been under qualified and under trained. Such a practice was also influenced by managerial advantages of recruiting such teachers. Though over the last couple of decades, efforts have been made to improve the situation resulting in a slight increase in the proportion of qualified teachers available in primary schools, the improvement still remains far below the needed requirement, except in Bhutan (Table 4). Sizable numbers of teachers in countries like Bangladesh remain under-qualified. On the

whole, there is a huge shortage of teachers in South Asian countries. According to the estimates of UNESCO, there is a requirement of 15 million teachers in the region over and above teacher replacement by 2030.

While the improvement in literacy levels, enrollment figures and accessibility in primary education is certainly no mean achievement for South Asia, countries in this region have responded differently to meet the challenge of universal primary education. For most there have been challenges on the social, cultural and political front resulting in a lacuna in the progress in the case of a few key indicators. Maldives, Sri Lanka and Bhutan have shown exceptional progress in most indicators; India, Bangladesh and Nepal have shown moderate progress while enrollment and literacy levels in Pakistan have been alarmingly low. Further, research points to glaring failures in the efficiency and quality of educational progress; one still notices continuing high numbers of out-of-school children, high drop-out rates, low completion rates and poor age-specific educational outcomes. The outcomes and progress of the educational sector as a whole and specifically primary education in South Asia leave a lot to be desired.

Out-of-school children is a phenomenon that plagues countries in this region acutely with approximately 22% of the world's out-of-school children living here. These children, in the age group 6 to 14, have never even been enrolled in elementary education, or have been absent from school without prior intimation for 45 days or more in a year. Out of the 12 million out-of-school children in South Asia, ten million are in India and Pakistan. "Perhaps most strikingly, Pakistan has the highest number of out-of-school children worldwide after Nigeria" (Hunter, 2020). Post-2000 there has been about a 56% decline in such school children in South Asia. There has been a decline in primary school age children, from around 43% in the 1970s to seven per cent in 2019. This decline has been pronounced beginning 2000 when the ratio was 21% and declined to eight per cent in 2007. In 2020, in India and Pakistan, as many as 17% girls in the age-group 10–17 were not in school (Béteille et al., 2020).

The primary completion rate, another standard indicator, which is defined as the number of students in the last grade of primary school minus the number of repeaters in that grade, divided by the total number of children who are of an official graduation age, is widely considered as a measure of efficiency of primary education. Interestingly, the ratios are high in the region, except in Bangladesh and Pakistan, and are higher in the case of females except in Pakistan (Table 5).

While many indicators show that there has been reasonably good to impressive progress in terms of accessibility to education, increased schooling has not translated into any significant improvement in learning. Learning outcomes are hugely unsatisfactory with more than 50% of pupils in Bangladesh, Pakistan and India recording below minimum reading proficiency levels even after completing primary school education, as the annual reports of Pratham Foundation in India and citizen-led assessments in South Asian (and other) countries reveal. The citizen-led assessments indicates that only 46% of children in Pakistan's public schools and 48% in India's public schools can read a Grade II level text by the time they reach Grade V (ASER Pakistan, 2015; ASER India, 2016). In India, Pakistan, Afghanistan, Bangladesh, and Nepal, less than half the number of students who leave primary school are equipped with the basic foundational skills that one would expect them to acquire by the end of primary level. Summing up available evidence, the Asian Development Bank (2017) has stated that a large share of primary school graduates in South Asia lacks basic

Table 5 Completion rate in primary education (%).

Source: World Bank (2021).

numeracy and literacy skills; and the [World Bank \(2018\)](#) has estimated that about 120 million youth (age 15–24 years) in South Asia lack foundational learning skills. Children who do not acquire the basic foundational skills of literacy and numeracy by the age of ten, are feared to fall into ‘learning poverty’ ([World Bank, 2020a](#)), a pre-cursor to other forms of poverty. In short, with a chronic quality deficit, South Asia is in the midst of a learning crisis: with over one-third of its students having no grade-level competencies which is a serious challenge. Recruitment of quality teachers in required numbers is essential to break the “low-quality education equilibrium” that the region is characterized with ([Richards et al., 2022](#)).

Secondary education

With the rapid growth in enrollments in primary education and improved efficiency rates, secondary education can be expected to grow fast. So obviously there is an impressive growth in enrollment ratios in secondary education in the countries of the South Asian region. The gross enrollment ratio in Sri Lanka was above 100% in 2019. At the regional level, the corresponding ratio is lower when it is compared with the world average of 76%, with Pakistan having the lowest enrollment ratio at 44%. But other countries are catching up with the world average and are even performing better ([Fig. 2](#)).

The net attendance rate is a better indicator of access to education as it measures the total number of students in the given official age group for a given level of education who are attending the given level of education, expressed as a percentage of the corresponding age-group population. Statistics on secondary education are available separately for lower secondary (generally grades IX and X) higher/upper secondary level (grades XI and XII). Net enrollment rates in the lower secondary level are higher than in the upper (higher) secondary level in all countries of the region, as shown in [Fig. 3](#). Both Nepal and India are ahead of Pakistan. A drop in net enrollment ratio is evident as we climb from the lower secondary to the higher secondary level in India, Nepal and Pakistan. In addition, [Fig. 3](#) highlights gender differences which are anyhow, not very high, except again in Pakistan.

Recognizing that secondary education has failed to provide any job-relevant skills, and has served only as a transitory phase toward higher education, it is not considered a viable terminal level of education in these nations ([Tilak, 2020](#)), and many countries have planned for significant expansion of vocational education streams at the secondary education level. While secondary education has expanded somewhat impressively in South Asia, the attempts to expand vocational/technical education at the secondary level have not been successful, with only 3.5% of upper secondary school students of South Asia being enrolled in vocational programmes as against the 21.7% world average. Vocational and technical education has failed to attract students in good numbers as policy plans have projected vocational and technical education programmes as cheap alternatives essentially meant for poor and academically less meritorious students. In fact, meager investments have been made on vocational secondary education in South Asian countries ([Tilak, 1988a, 2003b](#)). Some countries like India have started vocational educational programmes as add-ons in higher education.

Higher education in South Asia

For a long time, the discourse on strong linkages between education and economic development, reflected in the estimates of rates of return to education, has poignantly been argued, for raising priority for primary education especially in developing countries, relegating secondary and higher education to the background. As a result, secondary and higher education have severely suffered for several decades although ironically primary education too did not receive adequate funding. It is only recently that some changes have been observed. The importance of human capital has been recognized as an essential element in developing a knowledge

Fig. 2 Gross enrollment ratio in secondary education in South Asia (2019). Source: UIS (2021).

Fig. 3 Net attendance rate in secondary education in India, Nepal and Pakistan by gender (2016) (%). *Source: UIS (2021).*

economy which relies on the creation and use of intellectual capital, a specialized human capital, which in turn depends on higher education, including technical and professional higher education. This form of human capital is believed to be a significant determinant of economic output and growth, arresting diminishing returns to scale. As a result of this new understanding, since the late 1990s, higher education has grown substantially in South Asian countries as it has been recognized as essential for any country to be successful with globalization policies.

The higher education landscape in South Asia has been marked by a number of varying trends, perhaps under pressure from globalization. Tilak (2006b) has identified six global trends in higher education: (i) the rapid expansion of higher education; (ii) a decline in public subsidies for higher education; (iii) an increase in cost-recovery, particularly through student fees and student loans, and the generation of funds from the corporate sector and other non-State segments of the society; (iv) a neglect of the liberal arts and humanities, sciences and social sciences, (v) the large-scale adoption of new market modes of higher education including privatization, commoditization and commercialization; and (vi) internationalization of a new type. South Asian countries have also experienced similar trends in varying degrees.

Growth of higher education

There has been a significant rise in absolute numbers in South Asia especially with regard to enrollments, the increased number of colleges, universities, and in teachers available for higher education. As Bêteille et al. (2020) have estimated in South Asia, enrollments in higher education have grown at a staggering 387% over the past 15 years—from 11 million students in the early 2000s to 42 million students in 2019/20. The average annual growth rate over the period was 14%. The Maldives has experienced the highest rate of growth (35%), while Sri Lanka and Bhutan, the lowest (6%). The growth rate was steepest in the first decade of the 21st century, but even today higher education is growing rapidly and trends indicate that it is unlikely to slow down. The gross enrollment ratio in higher education in the region as a whole has increased remarkably by six times from four per cent in 1970 to 25% in 2019. In 2019, the corresponding enrollment ratio in the world is 39%. While the ratio is above 20% in India, Bangladesh and Sri Lanka, Pakistan, with an enrollment ratio of 8.9%, is almost at the bottom.

However, these figures given in Fig. 4 relating to South Asia are much lower than the corresponding figures of other Asian countries like China (50%) or South Korea (95%). India, it can be argued, has been a champion in this area, having developed the second largest higher educational system in the world, with nearly a 1000 universities, 40,000 colleges and 37 million students; the gross enrollment ratio in 2019 was 29% (Fig. 5). Bangladesh and Pakistan stand at a distant second and third positions with regard to the size of the system and enrollments. Student numbers are very small in Sri Lanka and Nepal. Bhutan has only just two universities, one of which is a medical one and the Maldives has none. As a result, hardly 0.4% of the Maldives' adult population has completed higher education. The percentage of population aged 25+ years with tertiary education varies between 9.5% in Sri Lanka, and 6.1% in India, on the one side and 2.3% in Nepal and 0.4% in the Maldives on the other end as shown in Fig. 6. On the whole, the ratio is very low in South Asia as compared to other advanced regions of the world.

The expansion of higher education in South Asian economies however, has been more in the area of general higher education. Bangladesh, for instance, in 2019 has 88% of its graduates in fields other than science, technology, engineering or mathematics.

Fig. 4 Growth in gross enrollment ratio in higher education in South Asia. *Source:* UIS (2021) and World Bank (2021).

Fig. 5 Growth of higher education in India. *Source:* Education in India 1950–51, Statistics on Higher and Technical Education in India (1990–91) and All India Survey on Higher Education, 2019–20 (Ministry of Human Resource Development, Government of India, New Delhi).

The figure for India is 68% and for the Maldives, 95%. This does not however imply that a higher value is placed on streams of education such as humanities or the liberal arts; the reality is that the exorbitant cost of acquiring professional education means that only certain privileged sections of society are able to access it and many from lower strata end up in less-expensive general higher education.

Globalization, which ushered a revolution in information and communication technologies (ICTs) as its prodigal offspring, has successfully packed the markets with educational courses offered in different forms and modes, with or without instructors and physical campuses. Internet-based study programmes and distance education have further helped the massification of higher education with students competing to acquire degrees that they hope will get them some jobs or others, irrespective of considerations like graduates' interest or merit. Most of South Asia is also facing a demographic dividend also known as the demographic bonus which refers to the likely economic growth that results from a significant increase in the skilled working-age

Fig. 6 Rate of higher education attainment in South Asia. (Percentage of population aged 25+ who have completed tertiary education). *Source:* World Bank (2021).

population (age 15–64). For example, 30% of Indians are under the age of 19 while Pakistan reports that 64% of its population is below the age of 30, and 29% between the age of 15 and 29; Bangladesh, Pakistan and Nepal have all the indications of a “youth bulge” (Ahmad, 2018; Trines, 2018b). In the face of a severe resource crunch and demographic pressures to meet the rising demand for higher education, governments have resorted to open and distance learning modes. Massive open online courses (MOOCs) have not only allowed access to higher education being provided by universities within the country at a cheaper cost, but have also enabled students to access universities abroad from any part of the country, without the hassle of travel and associated expenses, as long as their location, however remote, has internet access. Around 16,000 MOOCs have been launched by 950 universities all around the world (Shah, 2020), barring China. Distance education accounts for 11.1% of the total enrollments in higher education in India in 2019–20 (GoI, 2021). India is having the world’s largest open university, the Indira Gandhi National Open University with a student population of about ten million that far exceeds the population of some European countries. In addition, there are 15 state open universities and 110 dual mode universities. The questionable quality of the courses, however, implies that dreams of better prospects do not necessarily materialize into decent employment options for the marginalized. The disadvantaged often fail to catch up with the privileged who enjoy a better standard of education and have a natural advantage in terms of their social capital. So there is a crisis of graduate unemployment in South Asia. According to World Bank data, around 15% of the total labor force in India with advanced education is unemployed (2019); in Bhutan the figure is 18% (2013) and in Bangladesh, 11% (2017).

Inequalities in higher education

The higher education system in South Asia is also characterized by a high degree of inequality. As Tilak (2003a, p. 2274) notes, “the regional, social and economic inequalities that are a glaring feature in the societies of South Asia, are reflected in the educational systems, with the poor and socially backward areas suffering a severe degree of exclusion from education.” The enrollment and attendance figures in higher education reveal high levels of inequality across gender, income groups and rural and urban backgrounds. For South Asia as a whole the gross enrollment ratio for females was 3.5% in 1990 while for males it was 7.2%. The gender gap has narrowed over the years in favor of females with a gross enrollment ratio of 27% as against 26% for males in 2020. But the disparity against females continues and is pronounced in countries like Bangladesh where the gross enrollment ratio for males is 26% and for females is 20% in 2020. Pakistan also shows low and unequal enrollment figures in higher education in stark contrast with the Maldives which shows the highest gross enrollment ratio in South Asia with 67% among females, much higher than that of males at 18%. Indeed, the progress of the Maldives on certain socio-economic indicators have been impressive (World Bank, 2011). This tiny island nation has achieved five out of the eight Millennium Development Goals and today has achieved a MDG+ status. However, the *Education Sector Analysis Report* (Government of Maldives, 2019), shows that the apparent gender parity level achieved in higher education could be misleading: a high number of females have enrolled in hairdressing and beauty courses introduced in polytechnic colleges and in online nursing programmes. Further, the overall enrollment has increased due to the introduction of multiple modes of delivery initiated by the private sector. On the whole, it must be stated that women fare better than men in South Asia, except in Afghanistan and Bangladesh; and in all the countries of the region there has been significant improvement in gender inequality in higher education (Table 6).

Table 6 Gross enrolment ratio and gender inequality in higher education in South Asia, 2020.

	Gross enrollment ratio (%)						Gender inequality index ^a

Fig. 7 Inequality in gross attendance ratio in higher education in South Asian countries (Ratio among urban richest male vs. rural poorest female). Source: World Bank (2021).

But when one examines gender-wise ratio by economic classes and by rural and urban regions, inequalities sharpen. For example, in all countries of the region the enrollment ratio is highest for urban males belonging to the richest quintile and lowest among rural females belonging to the poorest quintile. The difference between these two groups is as high as 198 times in Pakistan and 108 times in Bhutan, while it is only 8.5 times in Bangladesh as depicted in Fig. 7.

Such a disparity reveals a gross neglect of higher education as a means to achieve equitable development levels. Examining the problem of unequal access to higher education in South Asia and Sub-Saharan Africa, Ilie and Rose (2016, pp. 446–447) have observed:

... While gender inequality continues to be a cause for concern, the magnitude of gender gaps is smaller than that of wealth-driven gaps. However, given that countries with higher rates of higher education participation also tend to have wider gender gaps amongst both the rich and the poor, there is a danger that as higher education systems expand in countries with lower levels of access, so could the gender gaps. This suggests the need to put in place strategies to address gender and wealth inequalities early on. As such higher education attendance rates are overall very small, the focus should be on measured expansion that is pro-poor and tackles any gender imbalance from the very beginning.

Despite high rates of return (Table 7) to higher education, in comparison to the other levels, there has been an insufficient expansion of higher education, specifically seen in the low participation of females and disadvantaged sections of the society, like the rural and poor, in higher education.

Policy dynamics: grappling with globalization

The current wave of globalization which began in the 1980s, which includes economic globalization, cultural globalization and political globalization, saw an important phase in the reform of education in South Asia. Here countries have been compelled to grapple with forces at the political, economic and cultural levels that have pushed them to “adjust”, “readjust”, “adapt” and “innovate” in the policy space. Globalization and associated market forces have raised a few basic questions such as: is education a public good or a private good? Who should take the responsibility of providing education—the state or the market? Why should education be provided free? What is wrong with profit-making in education? How much should students be charged for their education? At what level can education be largely driven by market forces and at what level is it necessary for the government to intervene? While some of these questions have never been asked for centuries, if not millennia, some issues have been settled, but they have re-emerged again. Generally, as no clear answers could be found, governments have tended to adopt *laissez faire* in education which has been marked by non-intervention and an absence of public policy (Tilak, 2005).

One can identify four major trends that have either originated or been accentuated with the adoption of the policies of globalization. They are: privatization of education; emergence of English as a medium of instruction; internationalization of higher education and emergence of ranking systems; and changes in the financing of education, including the entry of foreign aid into the education sector. These are briefly discussed here.

Privatization of education

Globalization has meant a large-scale entry of the private sector into the area of education which hitherto had been almost a state monopoly, or had insignificant levels of a private presence. Privatization, which originated as a charitable initiative in the field of education, gradually became a natural consequence of globalization dovetailing with simultaneous cuts in the education budget by governments. The private sector has projected itself as a rescuer of the education system from this resource crunch. The deficit in public expenditure on education, attributable to a lack of resources in general and more importantly a lack of political will, on the one hand, and a rising private demand for education on the other hand, have provided enough space for the private sector to enter and exploit the situation to the maximum. Soon a huge number of private players entered every level of education in almost all countries, more so in developing countries; and the nature of private involvement changed dramatically. Philanthropic principles were being replaced by purely principles of profit (Tilak, 2006a). These new “principles” did help education to grow enormously, albeit in different forms.

The private sector is a major player in every level of education in many countries including specifically in India, Bangladesh and Pakistan, as shown in Fig. 8. According to World Bank estimates, private schools account for 44% of enrollments in primary schools in India, 36% in Pakistan, and 24% in Bangladesh. In Bangladesh growth of several “private or community, NGO and non-mainstream religious schools” has been encouraged by the state (Hossain et al., 2002). In a study undertaken on the growth of private education in India, Kingdon (2017) shows that almost 50% of primary school-going children in urban India and more than 20% in rural India go to private schools. Public private partnership has also emerged as a strong presence in India when the Right to Education Act (2009) made it mandatory for all private schools to give a minimum of 25% of admissions to disadvantaged children against a compensation of fees by the state to the schools, which is seen by many more as a pro-private policy than as an equity-promoting initiative.

Secondary education is heavily dominated by the private sector in Bangladesh with 88% of secondary school students going to private schools. The corresponding ratio is 58% in India. Though relative numbers tend to decline in Bangladesh at every level of education, they still remain high (Table 8). Further, the share of private enrollments are highest in tertiary education in the region (except for Bangladesh where secondary education has the highest private enrollments) and the trends continue upwards.

In the area of higher education, most South Asian countries, except for Sri Lanka, have shifted a substantial part of the responsibility from the state to the private sector. During the first two decades of the 21st century, the percentage of enrollments in private higher education has grown from seven per cent in Pakistan (in 2003) to 35%; in Nepal from 26% to 37%; in Sri Lanka it has doubled from six per cent to 12% in five years between 2014 and 2019. It is only in Bangladesh that one notices the proportion significantly declining from 63% to 37% between 2000 and 2019. In India, it has been high at around 58%. Some of these zig-zag trends and patterns can be noticed in Fig. 9.

The “laissez-faire” policy of the governments, or policy absence, and/or pro-private policies explain the growth of private education in the region. Taking advantage of the absence of or the presence of weak regulatory systems, private players have opened so far as many as 408 private universities in India a kind of which were completely absent until the end of the 1980s. In 2019, 78% of

colleges were in the private sector. In Sri Lanka there was widespread popular resistance to the establishment of private universities and it was only legitimized as late as 2013. Ever since the trend has been changing. Currently along with the recognized private higher education providers there is a sector of unrecognized providers that is flourishing. Affiliated with foreign universities, as permitted by Sri Lankan law, they offer degree programmes jointly with foreign providers.

On the whole, South Asia has suffered from a lack of well-defined government policy in these dimensions. In the absence of a clear government vision and directives, the private sector has expanded recklessly and created a system that is infested with a dubious quality of education, exorbitant fees, rogue institutions providing fake degrees and a neglect of certain streams in the liberal arts and the need for developing “holistic” global citizens. All this weakens the linkages with the employment market. Yet they survive and even flourish by adopting cheap and dubious marketing strategies. These private institutions almost

exclusively rely on student tuition fees not only for their operating costs, but also for their development needs. The almost extortionist fees charged by these institutions result in an unequal access to education. For instance, in Pakistan the highest fees charged for a semester by private higher educational institutions can be as high as US \$3106 as against the US \$310 to US \$585 charged by public institutions (Hunter, 2020). Similarly, in India the cost per student varies between US \$4520 to US \$90,400 for a 2–4 year, “self-financing” professional degree course in public universities that are comparable to the fees charged in private institutions (ADB, 2012). For comparable programmes, public institutions charge a fraction of these figures. The high levels of fees charged by the private institutions drive students away from higher education, or force them to go abroad seeking admission in relatively less known public universities in small countries in Europe or Central Asia where they also struggle to adjust to difficult and strange cultures and conditions. Nepal’s higher education system had until 1986 one state university, Tribhuvan University funded by the government. Universities that have been established subsequently in Nepal are also owned by the government, but the major difference is that the new universities are required to charge high fees to cover their operating expenses; thus they function *de facto* as private institutions. Nepal also has an unusual system of public universities with privately owned campuses or affiliated colleges. In 2015–16, they numbered 777 as compared to community campuses (532) which receive some grants from the government or constituent campuses (98) that are entirely government funded.

The private institutions are also characterized by a lack of diversity in not only student population, as they cater to the needs of relatively better off sections of the society, but also by a lack of diversity in academic disciplines. Concentrating on revenue-generating disciplines like commerce, business management engineering, information technology, etc., they ignore liberal arts, humanities, social sciences, and even life sciences and physical sciences, which are important for development of a balanced higher education system on the one hand and of a humane society on the other.

An important dimension of private higher education institutions, apart from the fact that they treat education as a private good like any other commodity in the markets and charge exorbitant fees, is the questionable quality of the education they impart. Many private institutions don’t comply with state rules and regulations in terms of quality assurance, transparent admissions and the fair recruitment of faculty. Since making profits is the primary goal of private providers, and in the absence of any proper strong regulatory mechanisms, the foremost goals of equity and quality are relegated to the background and all other educational considerations including most importantly the public good characteristics are completely overlooked.

Globalization and medium of instruction

Globalization has also meant setting global uniform standards for education and moving away from local and regional knowledge systems. For instance, English as a medium of instruction in schools has become extremely popular and there has been a sharp and steady rise in private schools in South Asian countries offering English medium education, particularly in India, Nepal and Pakistan. Of course while the roots of ascribing a higher value to the English language can be seen in the colonial regime, these tendencies have become more entrenched with increased international interaction through growing globalization and liberalization. English language skills have been viewed as a powerful tool of globalization, growth and prosperity by individuals as well as collectively, by the nations. It is assumed that language not only increases the “cultural capital” (Bourdieu, 1986) of a person but also reduces social inequalities and poverty by increasing the overall employability, productivity and efficiency in a globalized labor market. English is ideologically perceived as a means of acquiring “linguistic capital,” which is often believed to be providing wide access to the global labor market. Modernization, employment in white collar jobs, and high wages are regarded as correlates of knowing English language. As a result, instruction in English in schools and colleges has become a dominant cultural paradigm (Sah, 2022) in South Asian societies. The discourse of a neoliberal language policy has led common people to perceive that an English medium education as the ideal one they aspire for their children in order to help them attain fast upward socio-economic mobility (Bhattacharya and Mukherjee, 2013; Erling and Seargeant, 2013).

Post-independence, most countries of the region adopted their local languages/mother tongues as medium of instruction and English as a subject in schools, which may still be pedagogically the best option. However, countries also got engulfed in controversies. Though there are five languages in Pakistan, Urdu was recognized as the official language, which has also been the medium of instruction in most of the schools. Sinhalese and Tamils in Sri Lanka insisted their own language to be the national official language and medium of instruction in schools. The debates on the medium of instruction are much more pronounced in Bangladesh as the country was formed with language identity as a key issue. A larger percentage of children studies in Bengali medium schools, and only a smaller percentage in English medium schools which are mostly private. However, the government policy allows, if not encourages, well-resourced schools to introduce English version of the national curriculum and to do away with the Bengali medium (Sharma, 2020). The problem is not so severe in other countries of the region, except in India, where initially a three-language formula was proposed which was never seriously implemented, and which was again proposed in the National Education Policy 2020 (GoI, 2020). On the whole, given the diversity in languages, “India has been particularly susceptible to the forces promoting [linguistic] fragmentalism” (Emerson, 1971, p. 181). Countries like India, Pakistan and Nepal have actually facilitated teaching of English soon after Independence, adopting a multi-lingual or a bilingual educational policy. In India the medium of instruction in both languages, mostly in local language, is offered in schools, while in colleges and universities the medium used to be English only for a long time, until the local language was introduced as an option. In most private schools, English is the medium of instruction while government schools use the local language. However, with globalization, many state governments have felt pressurized to offer English as a medium of instruction, along with the local language as an option to the students at all levels from pre-primary to higher in government schools and colleges. Though UNESCO’s and UNDP’s policy

programmes like the Education For all, and the Sustainable Development Goals (SDG 4.5.2) and constitutional provisions in countries like India, e.g., the Right to Education Act, clearly state that the local language/mother tongue/home language should be the medium of instruction at the primary level, many countries have ignored this noble vision, as English won the “language wars” in many South Asian countries (Chowdhury and Kabir, 2014). Though the non-availability of trained and qualified teachers in English is an important constraint many countries in the region face, they still seem to prefer a system with poor quality English teachers to one which has better qualified teachers proficient in local languages. It has been widely acknowledged that private schools thrive essentially because the medium of instruction is English. Sri Lanka introduced English as a medium of instruction only in 2001, viewing it as a means to prepare the younger generation to face “globalization” effectively (Wijayatunga, 2018). Similarly, Nepal has also seen an increasing trend in the growth of English medium schools, but in the absence of qualified teachers there is increasing criticism that students have not been able to develop sufficient skills either in their home language or in English, or in the subject (Sah, 2017). The emphasis given to English language is at the cost of local languages as an increasing number of students do not feel the need to learn local language or any other language. As Mehendale, 2020, p. 397) observes,

These shifts and the ensuing challenges need to be seen within contrasting forces of globalization and nationalism where policies aim at accommodating diverse imperatives while simultaneously aiming to develop a national identity through use of a common language such as English. Given the linguistic diversity and the pressures of globalization, maintaining a multilingual balance challenges the national education systems.

While in the post-colonial societies, the adoption of English has emerged as a form of neo-colonialism, in other countries, the adoption of English has become a neo-liberalist market response under globalization. As some rightly argue, “English medium schooling is a recipe for disaster for the learning of overwhelming majority of the disadvantaged, ... it will neither provide them basic communication skills in English, nor provide them education and social mobility, or higher order cognitive skills that will equip them to deal with challenges of the 21st Century ... [and this conclusion] is broadly applicable to the experience of many other former British colonies in Asia and Africa” (Kurrien, 2021).

Internationalization and ranking of institutions

A natural consequence of globalization has been the internationalization of higher education. Collaborations with universities worldwide and the exchange of students and faculty for teaching and research have been in practice for a long time essentially with a view to enhance the quality of the learning environment in university campuses. The same model, along with a few new ones like the setting up of campuses in foreign countries under new trade agreements, have made the internationalization of higher education a game changer in the global arena of education. The transformed models have altogether different objectives.

The inclusion of education in the General Agreement on Trade in Services (GATS) has opened up new avenues for better inter-connections among universities world-wide, by trading education. For developing countries of South Asia, however globalization has meant a strong influx of things and ideas from the global West; internationalization of universities has been more about emulating western standards, and grappling to survive in the global education market. Taking a “peripheral” role, universities in South Asia have been importers of education and the mobility of students has been predominantly one-way, from South Asia to the rest of the world.

Trade in education as defined by GATS occurs in four modes (Tilak, 2011): in the first mode, cross-border supply of education takes place without any movement of consumers or providers which includes all “e-learning” courses. As mentioned earlier, India has the second largest market for distance education after the United States. With increasing access to the internet, other countries like Nepal and Bangladesh have also sought refuge in foreign distance learning to increase access to higher education with limited resources. Private providers from the US, such as Coursera and edX, have colossal markets in these countries and local providers in South Asian countries are still way behind in competition. With respect to the second mode, viz., student mobility, one notes that the diaspora of South Asian students is one of the largest with the outbound mobility ratio, defined as the number of students studying abroad as a percentage of the total tertiary enrollment, which is 1.5% against the inbound ratio of 0.12% for the whole of South Asia. The highest outbound ratio in South Asia is 38% in the case of Bhutan, followed by Nepal, 20% and Sri Lanka, eight per cent. However, in absolute numbers, India is the second largest country after China with more than one million students studying abroad in 2021 as reported by the Ministry of External Affairs, India. This is projected to increase to 1.8 million by 2024. At the same time India is a popular destination for other South Asian students, and a sort of a leader in providing higher education, accounting for above half of the entire inbound student population from Asia (ADB, 2017; AIU 2017). As one can note from Fig. 10, the inbound students from South Asia number nearly 24 thousand in 2019–20; and they constitute about half of the all foreign students in India. Among the students from South Asia, who doubled in a decade from about 10 thousand in 2010–11, students from Nepal and Afghanistan account for more than three fourths (2019–20). Apart from proximity and culture, English medium education provided at comparatively lower cost has made India attractive to students from South Asia and also from the Caribbean and the Gulf countries which have a huge Indian diaspora. On the whole, with about 50,000 students from all countries in 2019–20, more than half of whom are from South Asia, India is still only a “neighbourhood’s education hub” (Xavier et al., 2020).

Note: Legends include: name of the country, number of students and their percentage.

Fig. 10 Country-wise distribution of inbound students from other South Asian countries to India, 2019–20. Source: Based on Gol (2021).

The third mode enables the commercial presence of universities in foreign countries and is by far the most contested one. On the one hand, it might limit the number of students traveling abroad and the expenses incurred therein, but on the other hand it may wipe out domestic universities which will find it hard to compete with international brands. In the context of India, Sahni and Kale (2004) argue that “the opening up of the domestic market for such branches however, would intensify the level of competition in India as an internal level of ‘brain drain’ of academicians may also occur in this field.” Finally, the last mode focusses on the temporary cross-border movement of researchers and teachers as service providers. Most developing countries, including India, have been lobbying for the removal of barriers in this mode owing to the comparative advantage that they possess in terms of abundant and specialized service providers in the areas of information technology, medicine, engineering, entertainment and hospitality to name a few (Sahni and Kale, 2004). On the whole, putting together all the four modes, the performance of South Asia in internationalization of higher education has been poor.

An important outcome of globalization is global competition along with internationalization. Every country wants to compete with others in attracting students, foreign students in particular. Global university rankings, which is also an offshoot and also a strengthening feature of globalization, have further accentuated competition, and every country wants to have its universities appear in the top positions in the global rankings. They are also keen on developing world class universities. For example, India at some point had planned to establish high quality research and innovation universities which might come close, in nature, to the world class universities. To this end, the government has planned to identify universities of eminence and strengthen them further to become world class universities. India also developed its own national university ranking systems to improve competition.

As per the current situation, South Asian universities rank poorly in international rankings. Except for a handful of institutions in the region, no higher education institutions in South Asia figures in any of the global rankings of the universities. Only eight South Asian universities, of which six are in India, one in Pakistan and one in Sri Lanka, have featured in the top 500 world universities in 2020 as ranked by the Times Higher Education (THE) World University Rankings. In the 2021 rankings, only four from South Asia figured among the top 500 (Table 9). Even in the QS Asia University Rankings (2021), only seven Indian institutions and the National University of Science and Technology, Pakistan appear in the top 100. None from South Asia figures in the top 30. As per the latest World University Rankings of the QS (2022), the performance of South Asia is marginally better, with 11 institutions — 8 from India and 3 from Pakistan — appearing among the top 500, with better ranks. Of course, not even one figures in the top 100.

The poor position of universities in global rankings reflects the poor quality of higher education in South Asia. The quality of education is a highly contested area covering a wide array of parameters ranging from graduate out-turn, graduate attributes, employability of graduates, and so on. These are clearly related to the quality of teaching programmes the universities offer, the research practices in the institutions and the performance of the institutions in social relevance and service. Both in terms of inputs, such as the quality of teachers, infrastructure, and outputs in terms of quality of graduates and research publications, many universities in South Asia fare very poorly.

Though there are certain limitations with such rankings, they are useful at least for certain limited purposes as they highlight the gaps in some key indicators on research performance and also on performance in teaching, highlighting wide gaps that exist

between different countries, apart from many other aspects, which may or may not necessarily be considered relevant by all countries (Tilak, 2016). Such information the ranking systems provide may be helpful to the governments and universities in taking appropriate policy initiatives and interventions.

On the whole within the South Asian region, higher education and research tend to privilege India, Pakistan, and Bangladesh, and among the three, India is more privileged. For example, in Table 9 we note that three out of four in top 500 universities in 2020, and six out of eight in 2021 in the Times Higher Education rankings, are Indian institutions. One university from Sri Lanka figures in the list both in 2020 and 2021; in 2020 one university from Pakistan was also in this category. India's advantage owes to its recognition of higher education and research in nation building and accordingly its laying strong foundations for higher education and research during the first three five year plans after independence. Moreover, India could absorb and benefit relatively better than other countries of the region, from the treasure of ancient Indian (*Vedic*) knowledge, as well as from the modern knowledge of the west. Sri Lanka has laid strong foundations on school education, but restricted the growth of higher education and research. Bangladesh is also laying emphasis on school education, but not much on higher education. So are the Maldives and Bhutan. India has also a scale advantage of having a large mass of higher educated graduates and a large number of higher education and research institutions.

Globalization and public funding of education

Among many aspects of globalization, the most noticeable one is the funding of education. Public funding reflects the priority that the state accords to education. The proportion of GDP allocated to education is an important standard indicator of the priority a nation gives to education. On an average, South Asia spent around 2.5% of its GDP on education as a whole as against a world average of 4.5% in 2019, in contrast to the recommendation of many including the UNESCO (2015) that governments should allocate at least 4–6% of GDP and/or at least 15–20% of total public expenditure to education. With quite a few ups and downs, including a peak of 3.4% in 2010, a dip of 2.4% in 2012, and a peak again of 3.4% in 2014, the GDP on education in this region has finally plateaued at 2.5% in 2016, that is marginally less than the level spent in 2000 (2.6%). The zig-zag trends of expenditure on education as a proportion of the GDP or of the total public expenditure shown in Fig. 11 reflect the wavering

Fig. 11 Public expenditure on education as a percentage of total public expenditure and GDP in South Asia. Source: World Bank (2021).

priority governments have accorded to education. The regional average in 2016 was about 17%, which is about the same in 2000 and 2007. These fluctuating trends also reveal an underlying instability, disparity, lack of vision for the future and an absence of clarity in the state's commitment to education.

Among all the South Asian countries, Bhutan accords the highest priority to education by allocating 7.2% of its GDP in 2017. This is also one of the highest figures in the world. The corresponding figure in Bangladesh is the lowest at 1.5%. According to 2017 data, Pakistan and Sri Lanka apparently devoted similar percentages of their GDP to education at 2.9% and 2.8% respectively. However, one needs to note that Sri Lanka has a historical advantage in terms of public spending on education and a well-established robust system; and these figure reflect mostly current expenses. On the other hand, Pakistan is still groping to set up its educational system; and its current levels of spending are the second lowest in the region (after Bangladesh).

Between elementary, secondary and higher levels, the share of higher education in GDP is the lowest in South Asian economies (Table 10). Except in the case of Nepal, intra-sectoral allocations do not significantly favor elementary education, as elementary education, an apparent priority sub-sector in education, does not account for even half the total allocation to education, though this is a stated goal in countries like India.

During the past three or four decades, the education sector has been subjected to severe cuts in public budgets in many countries, including in South Asia, which is also partly the result of adopting the adjustment policies that require the downsizing of budgets in all social sectors. These policies also required the introduction of user charges and cost recovery methods which are heavily resorted to in education, particularly in secondary, and more clearly, in higher education. According to the national Constitutions and international commitments, primary education is to be provided free. Though some nominal fees are charged in some countries, and high charges in private primary schools, public education at the primary level is not much subjected to cost recovery measures.

Most public universities in South Asia that have functioned hitherto with government support have also had to resort to "alternative" means of financing themselves in the face of severe cuts in state funding. Apart from raising student fees significantly, they have started offering "self-financing" courses in many subjects and diplomas or "executive" programmes, sometimes of dubious quality, provided at exorbitant fees (Asian Development Bank, 2012). User charges have been introduced for a variety of items and services which earlier were provided either free or at nominal charges. Student loan schemes have been introduced or restructured in India, Pakistan, Bangladesh, Nepal, and Sri Lanka, though they appeal only to a small proportion of students. Because of the increase in fees and associated expenditure in public and private institutions, household spending on education has become very sizable. As UNESCO (2015) has concluded, the proportion of a private (household) spending on education as compared to total spending on education in South Asia is among the highest in the world and continues to rise further. These trends have led to "a weakening of the state as the primary provider of education and [have] contribute[d] to the emergence of a dynamic political economy landscape where non-state actors have gained prominence and inequality of opportunities have gone unaddressed for generations" (Chudgar and

Aslam, 2020, p. 1053). The dominance of the private sector and high levels of private expenditure have created problems of inequitable access, poor quality and an uneven growth of higher education. High levels of private/household spending represent high levels of inequalities in education. Theoretically, private expenditure may complement public expenditure raising the overall level of expenditure on education, but as Tilak (2001) points out, the assumption of a complementary relationship between public and private expenditure on higher education can be erroneous, especially in the case of South Asia where they have been substituting each other. It is also important to note that there is a very strong correlation between educational attainment and government expenditure on education (Siddiqui, 2006; Tilak, 1999a), suggesting the need to protect government expenditure on education from frequent budget cuts.

The large-scale growth of the private sector and the associated growth of private expenditure on education are occurring because essentially education, particularly, but not just higher education, is increasingly being viewed as a private good, and the cost of losing the public good nature of education is not understood (Tilak, 2008b).

External aid for education

One particular aspect that perhaps needs to be mentioned in the present context of funding is foreign aid for education. Programmes like Education for All, the Millennium Development Goals and the Sustainable Development Goals that aim to achieve universal primary education serve as the rationale for foreign aid in the area of education in developing countries, including South Asia. Initially, the presence of the international community in the context of domestic education was more in the nature of aid in the form of grants and technical support. During the phase of adjustment, however, aid has taken on the form of loans. Realizing that “aid to education is unlike aid to other sectors because education is most susceptible to charges of interventionism, dependence and cultural domination, etc” (Tilak, 1988b), many countries have not been receptive to the idea of aid, particularly in the form of loans for education. But soon almost all countries in the region, India, Pakistan, Bangladesh, Bhutan, Sri Lanka and Nepal have resorted to the new mode of educational aid from multilateral organizations like the World Bank and the International Monetary Fund. India’s experience with foreign aid for education presents an interesting story. Initially India was averse to take any loan for primary education, while the World Bank was keen on entering into loan business in primary education in the late 1980s. Due to political economy factors including pressurized by the World Bank on one side and deteriorating economic situation in the country on the other, India gave in, initially agreeing for partial funding of primary education in 10 districts in the state of Uttar Pradesh in north India; but soon the project known as District Primary Education Project expanded covering nearly the entire country (Tilak, 1999b). Subsequently India has drastically reduced its dependence on aid for education. On the whole, most countries in the region have received external aid from multilateral organizations like the World Bank and Asian Development Bank and many bilateral sources. India has not only received aid from several sources, but also provided assistance to some countries in the region like Nepal, Bhutan, Maldives, and Afghanistan and also a few countries in Africa.

Overall, overseas development assistance (ODA) has been high in case of education in South Asian region. It increased by 2.5 times from US\$866 million in 1997–2000 to US\$2,185 million in 2019. In 2019 basic education accounted for 40% of the total, 22% by secondary education and post-secondary education 35% (Table 11). In case of India, the direction of assistance changed over the years significantly from primary education to post-secondary education, the latter accounting for 82% of total education aid it received in 2019, compared to less than 15% in 1997–2000. In Bhutan and the Maldives also we find post-secondary education receiving higher proportions of aid, but the absolute numbers are small. In Sri Lanka secondary education received 41.8% of the total education aid. In all other countries the priority of the international development organizations is in favor of basic education, as these countries are still farther from reaching the SDG goals relating to primary education. It is rather hard to make definite conclusions about the effectiveness of such aid in the education sector. A lot of research has analyzed the impact of foreign aid on education. Foreign aid has improved quantitative indicators of educational development that were in alignment with the goals of Education for All and the Millennium Development Goals for achieving universal primary education by 2015. While its impact on the physical expansion of education, in terms of enrollment or provision of educational infrastructure has been positive, the impact of aid on sustainable development in education in terms of providing quality education, in improving the quality of teachers, by providing high quality training and by bettering the learning outcomes of children has been rather disappointing. Aid has produced several desirable and not so desirable effects on educational policies in developing countries. The latter have been significant in some South Asian countries: some effects that aid has produced include a distortion in priorities and policies, a substitution of public funds and creating a culture of donor dependency (Tilak, 1997, 2008a). The perceived benefits of greater international interactions, an exchange of ideas and extension of financial aid have not all been achieved in South Asia. With a staggering 11.3 million children in the primary school-going age and 20.6 million children in the lower secondary school-going age in South Asia not going to school (UNICEF, 2018), there is enough reason to question the paths treaded by countries of the region to borrow for primary education. Therefore one can conclude that there is much scope for improvement in the aid mechanism (Riddell, 2012).

Concluding observations

Most of the South Asian countries gained independence from colonial rule in the middle of the 20th century. Nationalism in colonial period was essentially anti-colonial; but nationalism in independent nations is different. Nationalism and national values differ from country to country. The ancient Indian philosophy behind “*Vasudhaiva kutumbakam*” underlined the broad approach of India;

and it is secularism that determined the Indian nationalism after independence. But nationalism meant Muslim nationalism in Islamic countries like Pakistan, Bangladesh, and the Maldives (Emerson, 1971); Sri Lanka and Bhutan are influenced by Buddhism, and Nepal by Hinduism. Obviously schools are used to propagate the nationalistic, social, cultural, and political values based on which the political systems evolved in South Asian countries, like everywhere else. They are also used to propagate, working in their own specific cultural contexts, values of religion that the country is wedded to. For example, Vedic schools in India focused on imparting Vedic values, Sikh schools in India and Pakistan on Sikh values, Christian schools on Christian values, while madrasas in Islamic countries – Pakistan, Bangladesh, the Maldives – and also in India focused on Islamic values, though all are attempting to modernize themselves. The curriculum in many of the schools also includes basic sciences, mathematics and languages. The mainstream schools in India emphasize secular and universal human values. While broad values remained unaltered, over the period they have undergone marginal to significant changes in intensity and direction; and these changes necessitated somewhat frequent curricular reforms, as political ideologies and overall development paradigms also changed drastically. For example, given the alleged links with militancy, madrasas in India and also in other countries are subject to curricular reforms and modernization (Bano, 2010). Many other reforms are also introduced in the education systems in South Asia in the wake of globalization and growth of neo-liberalism.

The introduction of new policies and policy reforms in education are certainly influenced by political economy factors in almost every society. In fact, no policy reform takes place in a vacuum. Severely affected by several invasions and a long period of colonial rule, many countries in South Asia have been struggling to reform their education systems. Though they have not been able to develop their own indigenous systems replacing the colonial system of education, a phenomenal expansion has taken place in education mostly on the lines of the colonial model. Alongside, it has been crippled with a plethora of problems, partly accentuated by globalization.

Education development may be evaluated in terms of the quantity, quality and equity dimensions that form a triangle, an “elusive triangle” (Naik, 1979). In terms of all the three dimensions, South Asian countries have fared poorly in comparison with the more advanced regions of the world and they have a long way to catch up. Even within South Asian countries, there exists wide variations in education development.

To sum up the overall education development and prospects for future in terms of human capital index (World Bank 2020), South Asia fares very poorly compared to many other regions of the world. Among the 174 countries for which such an index has been developed, all the countries of the region, except Sri Lanka, figure in the second 100 only, as shown in Table 12. The value of the index ranged between 0.29 (Central African Republic) and 0.88 (Singapore), and it ranged between 0.4 and 0.6 among the countries of the South Asian region. The index captures “the amount of human capital a child born today could expect to attain by age 18, given the risks ... that prevail in the country where [the child] lives.” If so, as the index shows, the educational future of the South Asian countries should indeed be a matter of serious concern of all.

Table 12 Human Capital Index in South Asia, 2020

	<i>Index</i>	<i>Rank</i>
Afghanistan	0.40	148
Bangladesh	0.46	123
Bhutan	0.48	121
India	0.49	116
Nepal	0.50	109
Pakistan	0.41	144
Sri Lanka	0.60	71
Maldives	NA	NA

Education in many South Asian countries suffers from a policy crisis which can also be described as policy paralysis (Tilak, 2015). A coherent education policy, formulated based on a long-term vision for the development of society, is an important pre-requisite for building India has announced a visionary policy in 2020. a strong education system that will help in the social transformation, economic progress and nation-building. Of all the necessary requirements, a nation's political will is an important determinant of the nature, kind and pace of growth in a country's education framework and the public investments made in it. Unfortunately, most South Asian countries, with the exception of Sri Lanka, have shown a lack of strong public commitment toward education (Haq and Haq, 1998; Jahan, 2021). The complex challenges facing South Asia require exploring creative policies in education, by learning from each other's present and past, including ancient experiences and from other countries of Asia and the rest of the world.

Introduction

The geographical notion of East Asia or Northeast Asia has been defined in many different ways. Following the usage of East Asia and Northeast Asia in previous regional integration literature (i.e., [Cheong, 2005](#); [Li, 2007](#); [Kuroda and Passarelli, 2009](#)), in this article, Northeast Asia is referred to as the three major Northeast economies of China, Japan, and South Korea, with East Asia covering Northeast Asia, as well as Southeast Asia (comprising the ten ASEAN countries), unless otherwise specified. The East Asian region, however, is extremely diverse and complex (e.g., including Hong Kong and Taiwan), and does not easily constitute a single political, economic, or cultural entity. Within East Asia, the Southeast Asian region was, in many aspects, more advanced in multi-lateral higher education cooperation efforts than their Northeastern counterparts, and made much progress over the years through many programs (i.e., the ASEAN International Mobility for Students: AIMS program) administered by the Southeast Asian Ministers of Education Organization Regional Institute for Higher Education and Development (SEAMO RIHED hereafter) and ASEAN University Network (AUN hereafter). However, certain changes are being detected in this situation. The most notable change is the “CAMPUS ASIA” program, a multi-lateral student mobility program among the three countries, launched with a purpose to develop further into a more comprehensive higher education cooperation framework within Northeast Asia and beyond.

Nevertheless, due to the bitter history shrouding Northeast Asia, interregional higher education cooperation and one of its major projects in the form of the CAMPUS ASIA program is inevitably affected by the ever-changing geopolitics in the region. One of the major conflicts in this region occurred in 2017 when the U.S. deployed Terminal High Altitude Area Defense (THAAD) missile system on the Korean Peninsula, which caused heavy backlash from the Chinese government against South Korea, in the form of business sanctions, boycotts and tourist restrictions. Subsequently, the Korean government announced its New Southern Policy (NSP) that signaled its strategic shift toward Southeast Asia, in response to escalating tensions with China. To make matters worse, a 2019 Korean Supreme Court ruling on “comfort women” rekindled old colonial tensions between Japan and South Korea and ensued a trade dispute. Furthermore, Chinese suppression of democratic protests in Hong Kong and attempts to extend geopolitical influence through international education (e.g., Confucius Institutes), continuing missile tests by North Korea and the ongoing US-China trade war has pushed Japan to lean on its alliance with the US more than ever before, furthering its divide with China, while South Korea has been left in a precarious position of balancing its geopolitical position between the US-Japan alliance and China. These geopolitical conditions have cast an unpredictable outlook for the future of regionalization of higher education in Northeast Asia and threaten to undermine the achievements of the CAMPUS ASIA program so far.

Against this backdrop, the purpose of this article is to (i) overview developments in the regionalization of higher education in Northeast Asia, particularly focusing on China, Japan, and South Korea, and then to (ii) investigate the geopolitics surrounding higher education in the region, and the impact it will have on the outlook for the region.

¹This article is based on [Byun and Um \(2012\)](#). However, many parts of this article were updated and rewritten mainly by Bawool Hong in order to reflect the developments since 2012, when the manuscript was originally published.

Intraregional dependence among Northeast Asian countries

Economic interdependence in Northeast Asia

Kuroda et al. (2010) observed that “behind the concept of the East Asian Community lies a situation where the weight of this region in the world economy is expanding ... a comparatively more independent economic system that does not rely on the Western economy is forming (5).” To provide some empirical data in line with this observation, we examined the relative importance of the three major Northeast Asian economies in relation to the world, and also investigated how they depended on each other. **Table 1** presents the economic profiles of China, Japan, and South Korea in terms of their share of the world's total in population, GDP(PPP), trade, and FDI (inflows) in 2019.

It is evident from the data below that China, Japan, and South Korea are key players in the global economy. These three countries account for over twenty percent of the world's population (20.49%) and GDP (22.95%), respectively. The Northeast Asian economy has grown rapidly so that it is now larger in economic size than that of North America and even greater than the EU in terms of GDP (PPP). In addition, the Northeast Asian region represented by China, Japan, and South Korea occupies 16.83% of the world's traded goods and services, the second largest among the regional blocs in the world economy, although it still lags behind the EU and North America in terms of Foreign Direct Investment (FDI) inflows.

Statistics have indicated that economic inter-dependency among the Northeast Asian countries has increased rapidly since the start of the 21st century, albeit having slightly slowed down in the past decade. **Table 2** below shows the changes in trade volumes in terms of both exports and imports among China, Japan, South Korea, and the US from 2001 to 2019. Upon close examination of **Table 2**, in general, the economic inter-dependence among these three countries has been increasing, while trade dependence between the three Northeast Asian countries with the US in terms of both exports and imports, has gradually decreased over time.

With China's ever-growing presence in the world economy, the share of trade in both Japan and South Korea with China has drastically increased in terms of exports and imports. For instance, South Korea's imports from China rose from US\$ 13.3 billion or 9.4% (of South Korea's total imports) in 2001 to US\$ 107.2 billion or 21.3% in 2019. The share of South Korea's exports to China also increased to US\$ 136.2 billion or 25.1% in 2019, up from US\$ 18.1 billion or 12.1% in 2001. Similar patterns can also be observed between Japan and China. For China, the share of trade with Japan and South Korea also substantially increased in terms of total trade, while, percentage-wise, slightly decreased for Korea (exports: 4.7 => 4.4%; imports: 9.6 => 8.3%) and decreased significantly for Japan (exports 16.9 => 5.7%; imports 17.6 => 8.2%).

Furthermore, the trade volume for all 3 Northeast Asia countries in term of exports to and imports from the US, at least percentage-wise, has sharply decreased during the same period (China 20.4 => 16.7%, Japan 30.4 => 19.8%, Korea 20.8 => 13.5% on the export side, and China 10.8 => 5.9%, Japan 18.3 => 11.2%, Korea 15.9 => 12.3% on the import side). These data clearly indicate that, despite the fact that Northeast Asian countries still heavily rely on exports to countries outside the region (i.e., the US), intra-regional trade has played an increasingly important role for these countries' economies. Thus, China is currently one of the most important trade partners of Japan and South Korea in terms of both exports and imports.

Growth & diversity of cross-border higher education in Northeast Asia

As was illustrated in the previous section, the interdependence of the Northeast regional economy has grown substantially over the past two decades. Moreover, when closely examining recent developments of cross-border higher education activities in the region, similar trends can also be identified in the area of higher education as well. This section describes some of the recent developments in cross-border higher education among the three Northeast Asian countries, especially in terms of intraregional student mobility.

Table 3 below shows the international student flow in Northeast Asia over a span of nearly 2 decades (2000–2019). The data indicate that during this period all 3 Northeast Asian countries (China, Japan, South Korea) experienced exponential growth in recruiting international students within their territories, which demonstrates growing student mobility in this region. For instance, the number of international students in South Korea increased by almost 48-fold from 3373 in 2000 to 160,165 in 2019. The

Note: Statistics include all forms of international students (e.g., study abroad, language programs etc.).

Source: The Educational Statistics Yearbook of China, Ministry of Education of the People's Republic of China (en.moe.gov.cn), Japan Student Services Organization (jasso.go.jp), Korean Educational Development Institute (kedi.re.kr), Korean Ministry of Education (moe.go.kr), UNESCO Institute of Statistics (uis.unesco.org), Open Doors (opendoorsdata.org).

growth in international student enrollments at China's HEIs was even more astounding in terms of sheer quantitative mass, whereby over 440,000 additional international students were admitted at Chinese HEIs within the past 20 years. As for Japan, although not as exponentially as its other Northeast Asian counterparts; the number of international students still increased at a relatively rapid rate, especially when compared to the US.

In addition, similar trends were observed for outbound student mobility as well. China sent 662,100 students abroad in 2019, representing almost a five-fold increase from 2000, while Korea sent 142,009 more students abroad than it did in 2000. Japan on the other hand experienced a slight decrease in outbound students between 2000 and 2009, before experiencing a sharp increase in the past decade. With that in mind, it can be empirically assumed that international student mobility over the past 2 decades has grown faster, in terms of growth rates and absolute numbers, in the Northeast Asian countries, and even more so in relative terms to the traditional center of international student mobility: the US.

Furthermore, such rapid increases in inbound international students to these 3 Northeast Asia countries, have also changed the makeup of international students in each respective country, as shown in [Table 4](#) below. In 2000, the Northeast Asian countries were the top 2 feeder countries for each other. In the case of China, South Korea accounted for 32.2% of all international students while Japan came in second at 26.5%. And for Japan and South Korea, Chinese students constituted the majority of international students at 47% and 35% respectively, while the two countries (Japan & South Korea) were each other's second highest feeder country of international students. By 2019, the Northeast Asian countries were still each other's top feeding country and increased their sending numbers quantitatively, but also expanded their makeup to include a Southeast Asian country as their second largest feeder country (Thailand rose to be the second largest feeder country for China, while Vietnam emerged as the second largest feeder country for both Japan and South Korea).

This showed that not only did cross border higher education in Northeast Asia increase quantitatively, but also became increasingly more diversified. China being the prime example, branched out to even include more students from South Asia (Pakistan and

²It is noted that number of student flow by itself is not the best indicator for quality of mobility. Information on how long (on average) students spent abroad was not included due to limited statistics and data on student mobility in Northeast Asia.

India as third and fourth largest feeder countries respectively), while Japan too expanded its reach to South Asia (Nepal as third largest feeder country). South Korea would take a slightly different route by attracting more students from Central Asia (Uzbekistan and Mongolia as third and fourth largest feeder countries respectively). This increasing diversity of international student makeup in Northeast Asia, lies in sharp contrast to the US, whereby the international student body over the past 2 decades has increasingly become more concentrated on China and India.

To summarize, the data presented in this section suggest that, since the early 2000s, cross-border higher education activities in Northeast Asia have drastically increased and has led to form a certain degree of de facto integration of higher education in this region. This growing inter-dependence of higher education systems in Northeast Asia has also resulted in the development of a more concrete regional higher education cooperation framework in Northeast Asia. The next section further explores this issue.

Regionalization of higher education in Northeast Asia

Emergence of regional higher education cooperation framework in Northeast Asia: a historical overview

Contrary to Southeast Asia, where ASEAN has played a pivotal role in developing a regional identity and systematic higher education cooperation frameworks over the last couple of decades; there is no regional body comparable to ASEAN in Northeast Asia, that enables a multilateral approach. This is probably due to several intertwined factors having shaped the complex geopolitical situation in Northeast Asia: (i) the political tension among countries in Northeast Asia during and even after the Cold War era, (ii) rivalry between Japan and an emerging China, and (iii) the complicated historical legacies between China, South Korea, and Japan, in particular, of the first half of the 20th century (Chapman, 2010; OECD, 2004). For these reasons, in Northeast Asia, discussions on regional higher education integration started only since the early 2000s. In particular, to avoid this delicate geopolitical situation in Northeast Asia, at the beginning, these discussions usually took place in a much broader context, such as ASEAN + 3 or East Asian Summit (EAS) where ASEAN in most cases played an important mediating role.

The first critical momentum to facilitate close cooperation among these three countries was brought on by the East Asian financial crisis in the late-1990s. The crisis provided East Asian economies with a new perspective on regional cooperation, which actually introduced several significant government-led regional integration processes in East Asia. For instance, in response to the crisis, the leaders of China, Japan, and South Korea were unofficially invited to the ASEAN's 30th anniversary, which paved a way for forming the ASEAN + 3 mechanism. Through this newly created mechanism, all three major Northeast Asian countries participated in the discussions, for the first time, on intra-regional higher education cooperation in a much broader regional context of East Asia. The importance of higher education cooperation in East Asian countries has since then been actively discussed at ASEAN + 3 meetings, and

Table 5 Major recommendations & declarations emphasizing the regional integration of East Asian higher education involving China, Japan, and South Korea.

<i>Regional process</i>	<i>Attention to higher education</i>
East Asia vision group (EAVG) prospect report in 2001	To work together with cultural and educational institutions to promote a strong sense of identity and an East Asian consciousness, and to promote East Asian studies in the region through cooperative programs, teaching or languages, establishment of networks; expanding the ASEAN University Network (AUN) to the rest of East Asia, and profiting by existing bilateral initiatives between ASEAN and China, Japan, and South Korea (EAVG recommendations, section Conclusion “Social, Cultural and Education Cooperation”, points 98 and 100)
ASEAN + 3 leaders’ declaration at the 7th ASEAN + 3 summit in 2003	To promote lifelong learning programs; credit transfer systems; scholarships and exchange programs for students, faculty, staff; research and development cooperation; “centers of excellence,” including e-learning; and curricular development as bases for common regional qualification standards among interested centers/institutions (recommendations adopted in the area of education)
Kuala Lumpur declaration at the 1st East Asian summit in 2005	To enhance people-to-people exchange aimed at developing a “we feeling”; to encourage the sharing of ideas through greater interactions between students, academicians, researchers, artists, media, and youths among countries in East Asia; to conduct regular exchange of intellectuals, members of think tanks, religious personalities, and scholars, which will benefit from East Asia and the world through deeper knowledge and understandings so as to fight intolerance and improve understanding among cultures and civilizations (Articles 6, 7, 8)

Note: Modified from Yepes (2007).

sometimes in an even broader context, such as the EAS that started in 2005, which expanded its membership further to Australia, New Zealand, and India. Some of the most important recommendations and declarations emphasizing the role of East Asian higher education cooperation from various regional processes involving China, Japan, and South Korea, are summarized in Table 5 above.

However, the most dramatic change in the developments of higher education cooperation framework in Northeast Asia was brought about by the establishment of the trilateral summit meeting among the leaders of China, Japan, and South Korea. Not surprisingly, as was the case with the initiation of discussions on establishing an East Asian community at the ASEAN + 3 Summit; the development of a leaders’ network among the three Northeast Asian countries was again the most important factor in accelerating recent talks on the regionalization of higher education in Northeast Asia. The trilateral summit meeting, involving exclusively China, Japan, and South Korea, first took place in 2008. Since then, these three core countries in Northeast Asia have met annually under the formal institutional framework of the China-Japan-Korea Trilateral Summit (the Trilateral Summit hereafter). This shows that these three countries consider, on top of the greater ASEAN + 3 option, the Northeast Asian option as one viable regional scope for more fruitful regional cooperation.

Seen from European experiences, however, the success of regional integration is dependent on the development of a true regional identity. This point was well stressed by then Japanese Prime Minister Hatoyama’s proposal of establishing an “East Asian Community” at the second Trilateral Summit meeting held at Beijing in October 2009, and which was again reflected as a key item in “the Joint Statement on the 10th Anniversary of Trilateral Cooperation among the People’s Republic of China, Japan, and the Republic of Korea”, adopted by the leaders of the three countries (Yonezawa and Meerman, 2010). The Joint Statement said that “we have agree [d] ... [to] continue to conduct exchanges among all sectors of the three countries, particularly friendly youth exchanges and exchanges among universities[to] consider establishing a long-term mechanism for youth and media exchanges, encourage academic institutions and local authorities, and promote closer trilateral cooperation in areas such as ... education”

In the area of higher education, this agreement had an immediate impact on the ongoing movement toward establishing a common regional framework to encourage student exchanges among the Northeast Asian countries. To implement this agreement, the governments of the three countries set up a “Joint Expert Committee for Promoting Exchange and Cooperation (Joint Expert Committee hereafter)” to discuss and develop guidelines to support exchange programs among universities in China, Japan, and South Korea. On May 29, 2010 in Jeju, South Korea, the leaders of China, Japan, and South Korea convened again at the third Trilateral Summit Meeting and agreed on the early realization of the CAMPUS ASIA program, the Northeast Asian version of the European ERASMUS program.

At this Summit, the leaders of the three countries also adopted a “Trilateral Cooperation VISION 2020”, articulating “[we] share the common recognition that by presenting specific goals and visions to be achieved through cooperation by 2020, our future-oriented comprehensive cooperative partnership will be more solid.” These two historic documents at the Trilateral Summits have so far been the most high-profile and comprehensive agreements on higher education cooperation among the three Northeast Asian countries, which finally resulted in the CAMPUS ASIA program. It was the first and most concrete multilateral student exchange initiative taken by the Northeast Asian countries, which has high potential to be further developed into a more comprehensive regional higher education cooperation framework in this region.

CAMPUS ASIA program (China, Japan & South Korea)

The CAMPUS ASIA program implemented its small-scale pilot program from 2012 to 2015. A joint call for pilot program proposals was announced in May 2011, and ten consortiums were selected through a two-stage evaluation process (one by each country and the other by a joint trilateral evaluation). Then in January 2016, the first South Korea–Japan–China Education Minister Meeting was held, whereby all three countries agreed to expand the pilot program into a full-fledged program that would include 17 consortia. As a result, the official CAMPUS ASIA program was launched in December 2016, along with the first Trilateral Rectors' Forum. And as of 2019, the CAMPUS ASIA program has expanded to include 17 consortia consisting of 40 universities. Table 6 above, shows the list of CAMPUS ASIA consortia and participating universities from South Korea, Japan, and China, along with their areas of cooperation.

Unfortunately, however, throughout the life of the CAMPUS Asia program, the Northeast Asian region has gone through a complicated geopolitical rollercoaster, with tensions between Japan–Korea constantly being rekindled over historical (i.e., comfort women) and territorial sovereignty (i.e., Dokdo/Takeshima Islands) issues, strained relations between all three states due to military issues (e.g., North Korean military threat, deployment of American THAAD missile system in Korea, Japan's increasing military presence), while the looming US–China trade war has further pushed a geopolitical wedge in the region.

As a result, the progress of the CAMPUS ASIA program has come to a stall in recent years. According to the plan agreed upon by the three countries' government in 2016, the three countries participating in CAMPUS ASIA program have been seeking to expand the scope of the program in the second stage to link it to universities in the ASEAN region, but discussions have not progressed at all due to the recent political tensions among the three countries. Therefore, in addition to the CAMPUS ASIA program among the three countries; South Korea (2016) and Japan (2013) have also participated in the AIMS program, a government-backed official student exchange platform where 7 ASEAN partner countries (Malaysia, Indonesia, Singapore, Thailand, Vietnam, Philippines, and Brunei) and 2 Northeast Asian Countries (Japan and South Korea) are involved.

Challenges for regionalization of higher education in Northeast Asia

Substantiated policy frameworks so far aimed at the integration of higher education systems in East Asia, were initiated first at the sub-region level on the assumption that (i) higher education cooperation frameworks at the sub-regional level would create better opportunities for countries in the sub-region to take full advantage of geographical proximity, and more intimately shared cultural and educational heritage of neighboring countries, and that (ii) once they matured, these sub-regional cooperation frameworks would then ultimately contribute to the formation of a Pan-East Asian higher education community. Initially it seemed as if this approach would be very efficient and somewhat inevitable at least for a while, given the huge diversity and developmental gaps existing across various sub-regions in East Asia. From this viewpoint, the regionalization of higher education in Northeast Asia was interpreted as a first step or a building block toward forming a greater East Asian higher education area.

From a more practical perspective, significant complementarities exist between China, Japan, and South Korea. For instance, in the case of South Korea and Japan; they have a strong domestic capacity to provide higher education, as domestic enrollment rates in these countries have continued decreasing in recent years due to the decline of college age students, while China still remains as the top feeder for both countries. Thus, closer regional higher education cooperation is inevitable in the near future, as it will provide both resources and markets to each other.

However, the engine that once accelerated the movement toward regionalization of higher education in Northeast Asia, has been losing steam as of late. The governments of the Northeast Asian countries are facing many complicated issues at hand, such as escalating geopolitical tensions, leadership issue over the region, the US influence on Northeast Asian higher education and most recently, the outbreak of COVID-19.

Geopolitical tensions in Northeast Asia

The geopolitical situation in Northeast Asia is much less conducive to the regionalization of higher education than the situation in Europe or in Southeast Asia. Territorial and political conflicts remain unsettled, and regional factors driving regional integration seem far more complicated in Northeast Asia (Seliger, 2011).

One important momentum triggering heavy geopolitical tensions in Northeast Asia was initiated by the deployment of the Terminal High Altitude Area Defense (THAAD) missile system (in South Korea) by the US in April of 2017, generating deep discontent in China. The Chinese government responded by embarking on business sanctions and pulling back on Chinese tourists, which hurt the sales performance of major Korean companies such as Lotte, Hyundai and Kia in China, as well as businesses in Korea's Jeju Island, whereby nearly 90% of tourists come from mainland China (South China Morning Post, 2017). Despite various efforts, it was difficult for both sides to come to a mutual diplomatic agreement, as there was a gap in understanding on the intentions of each side. This placed Korea in quite a precarious position, as it was forced to find a "middle way" between its military partnership with the US-Japan alliance, while protecting its economic partnership with China (The Korea Herald, 2017). It was during this period where Korean President Moon Jae-In declared Korea's New Southern Policy (NSP), signaling the country's strategic pivot toward the ASEAN region so as to diversify away from Korea's heavy economic reliance on China. It would also reprioritize Korea's diplomacy toward the so-called "Big Four" (US, China, Japan, Russia) in the region (The Korea Times, 2020).

Geopolitical tensions in the region were further escalated when in 2018, the South Korean Supreme Court ordered Japanese firms to compensate Koreans whom they had used as forced labor. Two Japanese companies had their assets seized in Korea, while Mitsubishi Heavy, one of the firms involved, refused to comply with the court order (BBC News, 2019). In addition, the Japanese government tightened control on exports of three chemicals essential for making semiconductors and flat panel screens used in smartphones and TVs, and by doing so threatened Korea's high-tech economy. The Abe administration then turned up the heat in August 2019, by formally taking Korea off its "whitelist", which meant Japanese companies now needed government approval to export sensitive materials to Korea (Nikkei Asia, 2019). This sparked a nation-wide boycott of Japanese goods in Korea, with anti-Japanese sentiment being spread through social networking services and other major media outlets. Hence, it ignited a mini trade war between the two countries, which not only troubled the region, but also the global supply chain system that was already reeling from a US-China trade war.

Regional leadership

With the above-mentioned geopolitical situation in mind, will the Northeast Asian region become a more coherent regional bloc of higher education integration in the near future? If so, what implications does this have for the establishment of a broader East Asian higher education area? Many scholars in the past (e.g., Kuroda and Passarelli, 2009; Mok, 2011) have argued that, as opposed to what has happened and is happening in Europe; the developments of regional higher education cooperation and its related institutions in East Asia can only be called nascent, as the majority of these agreements and institutional frameworks are either very shallow or rather sub-regional. For instance, Evans (2005, cited in Mok, 2011:20) argued that regional agreements for higher education cooperation in East Asia, such as the Kuala Lumpur Declaration, may comprise just "little more than talking and becoming familiar with one another (211)." And when considering the current state of affairs in the region, this view seems to still hold true even in the present moment.

There is not anything like the European Union or the Bologna process in East Asia. In addition, the government-level efforts in East Asia have taken place at a sub-regional level through agreements between neighboring states, rather than at a pan-regional level as in the case of Europe. For instance, ASEAN countries reached a consensus in 2003 to establish an ASEAN community, and South-east Asian Ministers of Education Organization—Regional Center for Higher Education and Development (SEAMEO RIHED) discussed an even more ambitious idea of creating a Southeast Asian Higher Education Area (SEA-HEA) within its own region (Aphijanyatham, 2010; Kuroda et al., 2010). In parallel, Northeast Asia also initiated the CAMPUS Asia program within its own regional boundary as well, however these efforts are still lagging behind in terms of becoming a truly pan-regional approach.

Why is this the case in East Asia? The underlying reasons behind the present situation need to be understood. First of all, East Asia is complex and diverse. There is less common cultural, linguistic, and religious ground in the East Asian region than in Europe. This extreme diversity poses various challenges for regional integration in East Asia, that would be difficult to settle in a short time period. Second, contrary to Europe, there is no powerful supranational body that is able to accelerate a multilateral approach. ASEAN, EAS, and Asia-Pacific Economic Cooperation (APEC) do not have enough institutional capacity to forge a strong consensus that cuts across national agendas. This is largely in part due to the emerging intra-regional rivalry between China and Japan, as a rapidly rising China aims to expand its sphere of influence in the region, while Japan leans heavier on its US-led alliances in order to control China's growing influence.

US influence on Northeast Asian higher education

Another salient feature characterizing Northeast Asia is the strong influence of the US in this region. The US is "an indirect political and economic factor in Northeast Asian integration (Seliger, 2011:4)." The area of higher education is not an exception for this US influence. As shown in Table 4 of section **Intraregional dependence among Northeast Asian countries**, Chinese and South Korean students still make up a large percentage of international students that choose to study in the US as a favored study destination, due to the ever-growing role of English as well as its better quality of higher education. These patterns and trends were threatened with the rise of American isolationism during the Trump administration years, and it seemed as if Northeast Asian countries would be coerced away from US influence in the area of higher education. However, the Biden Administration that tends to favor more multi-lateral approaches to government policies, may influence the status quo into a new direction once more.

Although in the past decade the rate of growth of cross-border activities between Northeast Asian countries and the US has slowed down; at the end of the day, the US will still inevitably influence the speed and shape of future regionalization of higher education in Northeast Asia. Yet, until now, no political consensus has yet emerged as to how this strong interdependence between Northeast Asian countries and the US can properly be taken into account in achieving a higher education integration in Northeast Asia.

Conclusion

The outbreak of COVID-19 has posed an unprecedented threat to Northeast Asia across all facets of society. In 2020 alone, the total number of confirmed cases was over 60,000 in South Korea, 87,000 in China, and 230,000 in Japan (Worldometer, 2020; World Health Organization, n.d.). The region faced similar difficulties during the 1997 Asian Financial Crisis and 2008 Global Recession, however, never has there been such a global biological threat, that has either legally prevented international students from studying abroad or caused them to voluntarily choose not to go due to health concerns. This has only further stalled the regionalization of higher education in Northeast Asia, as students, faculty and government officials from each country are simply not able to meet one another in person like in the past.

Although there have been recent talks between governments on possible hybrid forms of student mobility (i.e., combining online and offline courses/educational activities); COVID-19 has cast a cloud over an already, bleak outlook for regionalization of higher education in Northeast Asia. Nevertheless, after the full-scale outbreak of COVID-19 in early 2020, the number of online courses offered has been rapidly expanding and its potential has been newly recognized by higher education policymakers and practitioners around the world. Given the situation we are now facing, geographical proximity may not necessarily be a key consideration of exchanges in the future, unlike before, due to the nature of online courses. However, it remains to be seen whether these new challenges brought on by COVID-19 will prove to be an opportunity or a threat to higher education cooperation in the Northeast Asian region.

In this sense, future developments for the regionalization of higher education in Northeast Asia are yet rife with uncertainty. The only thing that can be said for certain is that politicians of the three countries must change their approach toward historical and territorial disputes, if they truly wish to achieve regionalization in Northeast Asia, including the domain of higher education. Collaborative efforts to ease age-old tensions rather than aggravate them will be crucial.

Introduction

It is complicated to say whether small (and micro) states are more or less effective than large ones, not least because of the complexities associated with what is meant by a small state. Following small states scholars, we frequently use different terms interchangeably: small states, small vulnerable economies (SVE), microstates, small open economies, middle power, small islands developing states (SIDS),¹ to talk about small states (Armstrong et al., 1998; Commonwealth Advisory Group, 1997, 1985; Commonwealth Secretariat and World Bank, 2000; Read, 2004). In what follows, we use the term small states as a generic term to encapsulate all of the meanings above.

Many small states are considered SIDS and microstates, given their territorial and demographic economies of scale. While scale is a healthy prism to analyze the micro-climates of small states, it should not be the only way to examine the social realities of small states. Small states, which are primarily young post-colonial nations, have historically been singled out as cases for special attention, given that many of them have not achieved high levels of industrialization or economic diversification. The high degree of openness in their economies, stemming from high ratios of imports, also poses challenges to these states. While small states have sought to overcome their constraints, they are still saddled with high public expenditure on education and other social services. Moreover, many post-colonial small states are still aid-dependent, thus exacerbating the core/periphery challenge. On average, most small states receive 15% of their gross national income or USD 201 per capita from the Organisation for Economic Co-operation and Development's (OECD) Official Development Aid (ODA) program. As such, educational provision and attainment of global benchmarks in small states vary from Jamaica to Singapore. Small states differ significantly in their adoption and implementation of education reforms, with some achieving high rankings on global matrices such as the human development index, while others are perceived as vulnerable to "existential threats" (Girvan, 2010). As such, attention has been focused on strengthening institutional capacity, reducing vulnerability, adjusting to the international trade regimes, peripherality, aid dependence, and coping with the effects of globalization.

As Table 1 shows, many conceptualizations of small states are based on population size with an upper limit of 5 million. Regardless of their population size, the educational systems in small states face tremendous challenges in a changing global context. In the immediate post-independence period, the educational challenges of small states were centered on access and quality. Today, their challenges include meeting international commitments to the educational agendas of multilateral and financial institutions while implementing incremental educational reforms. While globalization has allowed small states to become less isolationary, it has also brought about unprecedented challenges for small states ranging from climate change to deregulated financial markets to changing global migration patterns to weak public sector capacity. Despite these challenges and the rise of the educational intelligent economy, many small states have managed to being closer to achieve universal access to basic education and gender parity in primary and secondary education as they have been the first to shift their educational priorities toward more pressing global commitments and issues of achieving quality, equity, and inclusion. Moreover, small states have remained committed to the educational priorities outlined in the Education for All for All (EFA) agenda, the Millennium Development Goals (MDGs), and the recent Sustainable Development Goals (SDGs).

Much of the recent literature on small states has avoided broad generalizations based on size and instead emphasizes how small states adapt to the changing nature of globalization and the onset of the fourth industrial revolution (Crossley and Sprague, 2017; Jules and Ressler, 2016; Salajan and Jules, 2019). Educational provisions in small states remain multipurpose and flexible, with schools having to accommodate the needs of diverse learners.

This chapter provides a literature review of education in small states. First, we discuss the difficulty of clearly defining small states. We present an overview of the different theories describing small states' smallness and vulnerability. We then offer a historiographical genealogy of small states research, focusing on the scholarship categorizing the two small state research generations. Third, we

¹The United Nations Department of Economic and Social Affairs (UNDESA) recognises 58 SIDS who share similar physical and structural challenges.

Table 1 Small States across the globe.

Region	Population < 1.5 million	Population, 1.5–5 million
Africa	Cape Verde; Equatorial Guinea; Gabon; São Tomé & Príncipe; Swaziland	Botswana; Central African Republic; Congo (Republic of); Eritrea; The Gambia; Guinea Bissau; Lesotho; Liberia; Namibia
Americas	French Guiana (FRORD); Suriname	Costa Rica; Panama; Uruguay
Arab States	Bahrain; Djibouti; Qatar	Lebanon; Mauritania; Oman; United Arab Emirates; West Bank and Gaza
Atlantic	Bermuda (BROT); Falkland Islands (BROT); Faroe Islands (DENSG); Greenland (DENSG); Iceland ; St Helena (BROT); St Pierre & Miquelon (FRTC)	
Asia	Bhutan; Brunei Darussalam; Macao-China (SAR); Timor Leste	Georgia; Mongolia; Singapore
Caribbean	Anguilla (BROT); Antigua & Barbuda; Aruba (NETHFA) The Bahamas; Barbados; Belize; British Virgin Islands (BROT); Cayman Islands (BROT); Dominica; Grenada; Guadeloupe (FRORD); Guyana; Martinique (FRORD); Montserrat (BROT); Netherlands Antilles (NETHFA); St Barthelemy (FROC); St Kitts & Nevis; St Lucia; St Martin (FROC); St Vincent & the Grenadines; Trinidad & Tobago; Turks & Caicos (BROT); US Virgin Islands (UST)	Jamaica; Puerto Rico (SGUT)
Europe	Andorra; Cyprus; Estonia; Gibraltar (BROT); Guernsey (UKCD); Isle of Man (UKCD); Jersey (UKCD); Liechtenstein; Luxembourg; Malta; Monaco; Montenegro; San Marino; The Vatican	Albania; Armenia; Bosnia & Herzegovina; Croatia; Ireland; Latvia; Lithuania; Macedonia FYR; Moldova; Norway; Slovenia
Indian Ocean	Christmas Island (AUST); Cocos Islands (AUST); Comoros; Mayotte (FROC); Maldives; Mauritius; Réunion (FRORD); Seychelles	
Pacific	American Samoa (UST); Cook Islands (SGNZ); Federated States of Micronesia; Fiji Islands; French Polynesia; Guam (SGUT); Kiribati; Marshall Islands; Nauru; New Caledonia (FRORD); Niue (SGNZ); Norfolk Island (AUST); Northern Marianas (SGCUS); Palau; Samoa; Solomon Islands; Tokelau (NZSAT); Tonga; Tuvalu; Vanuatu; Wallis & Futuna (FROC)	New Zealand

Countries in **bold** are members of the United Nations. Countries underlined are members of the Commonwealth. Data refer to 2008. *Abbreviations:* AUST – Australian Territory Administered from Canberra; BROT – British Overseas Territory; DENSG – Self-governing Overseas Administrative Division of Denmark; FROC – French Overseas Collectivity; FRORD – French Overseas Regions and Departments; NETHFA – Part of the Kingdom of The Netherlands with Full Autonomy in Internal Affairs; NZSAT – New Zealand Administering Territory; SAR – Special Administrative Region of the People's Republic of China; SGCUS – Commonwealth in Political Union with the USA; SGNZ – Self Governing in Association with New Zealand; SGUT – Self-Governing Unincorporated Territory of the USA; UKCD – United Kingdom Crown Dependency; UST – Unincorporated territory administered by USA Office of Insular Affairs.

Based on Crossley and Sprague (2012, p. 28).

explore education policies in small states. Finally, we offer some new directions in studying small states in the face of the fourth industrial revolution and the educational intelligent economy.

Toward a definition of small states

Despite the various attempts to define small states, there is still no single agreed-upon definition (Baldacchino, 2012a; Bacchus, 2008; Crowards, 2002; Crossley and Sprague, 2012; Jules and Ressler, 2017a,b). Most definitions of small states have created a “fundamental definitional ambiguity” (Long, 2017, p. 144) and are embedded in the colonial heritage of statehood. The colonial roots of current understandings of small states appear in the history of the Commonwealth Parliamentary Association (CPA), which was formed in 1911 to coordinate Britain's colonies and small protectorates and further centralize imperial power in the hands of the UK (CPA, n.d.). In 1981, the CPA recognized small states as having distinctive concerns that need to be addressed, and many formerly colonized small states have become members of the CPA. As such, current understandings of small states tend to begin with the definition derived “for” and “by” the Commonwealth States' London Declaration and are thus embedded in colonial hierarchies (Commonwealth Secretariate, 1949).

Early definitions of small states differentiated *small societies* from *small territories* and suggested that small societies exist in large states (Benedict, 1967). In this way, being small has been regarded as an impediment to state action and survival, and it is tied to “a specific spatio-temporal context” (Thorhallsson and Wivel, 2006, p. 654). However, small states have come to be defined by some common characteristics, which ranges from population size (1.5 million or less, though there are a few exceptions), geography (two-thirds of small island states are small states), land area, gross national product, vulnerability to natural disasters and climate change, their debt burden (which is usually higher for these countries than other developing countries), to how their characteristics make it difficult for them to fit the standard Western-centric post-colonial development model. However, as Table 1 shows, there are

challenges with these measurement characteristics, particularly around population size. For example, Kuznets (1960) sets an upper population limit of 10 million for small states; today, 134 countries could be considered small by this gauge. By the current measurement of between 1.5 and 5 million people (Armstrong et al., 1998; Bacchus, 2008; Commonwealth Secretariat, 2009; World Bank Group, 2016), a few large countries (e.g., Jamaica, Lesotho, Namibia, and Papua New Guinea) are also categorized as small since they share several of the same characteristics of smallness – including small Gross Domestic Products (GDP) (Commonwealth Secretariat/World Bank Task Force, 2000).

Additionally, the literature highlighting vulnerabilities associated with smallness typically makes assumptions that “small states share a high degree of conformity” (Jules and Ressler, 2017a,b, p. 21). However, changing global economies and definitions of scale mean that formal demographic characteristics defining small states may need to be re-examined. Jules and Ressler (2017a,b) argue that researchers should focus on the advantageous aspects of smallness rather than constraints in the absence of one clear definition of small states. Such thinking allows us to question categories such as “smallness” or even “state.” For example, some literature describes sub-national areas and jurisdictions within a large urban metropolis, such as the favelas of Rio de Janeiro, as exhibiting, facing, and responding to some of the characteristics that define small states (Straubhaar, 2017).

The discourse around small states frequently focuses on vulnerability narratives such as geography, demography, and economy to changing global markets, natural disasters, and limited productive and infrastructural capacity (Baldacchino, 2011; Jules, 2012). This narrative has led to a pervasive “deficit discourse” that centers on four perceived characteristics defining small states, including “exaggerated personalism, limited resources, inadequate service delivery and donor dependence” (Sutton, 2006, p. 13). The consequences of these vulnerability narratives have left small states frequently understood to be “passive recipients” (Jules and Ressler, 2017a,b) of uncritical educational transfer of global policy discourse. While all small states are unique, their smallness places the “idiosyncrasy of the state at the center of the stage” (Brock, 1987, p. 12) in their educational priorities.

While small states experience many of the same complex problems as big states, they are not smaller versions of large states but rather entities with distinct challenges, needs, and responses. Despite their distinct needs, educational policies in small states are often generalized copies of development trajectories that originated in states with very different contexts (Baldacchino, 2011; Brock, 1987; Brock and Crossley, 2013). The external push toward the educational policy transfer process that does not critically examine small states’ particular contexts is a challenge in and of itself. Baldacchino (2011) discusses the implications of this trend in education, where he argues that the transfer of policy used in large states has little bearing on the realities of small states and notes that “perhaps that is also one of the destinies, and definitions of a small state: not to be equipped with formal instruments of teaching and learning that speak directly and meaningfully to its social, economic, political and other narratives” (p. 461). Although small states are often viewed as takers of global policies, recently, we have begun to witness that as political and economic political and economic contexts become increasingly important in policy discussions, and the practice of uncritical policy educational transfer has declined (Jules and Ressler, 2016).

Small states face particular vulnerabilities that correspond to inherited colonial histories, population limits, and sensitivities to external markets; however, smallness can also operate as an essential strength in a rapidly changing global economic and political landscape. Many existing definitions of small states cite economic dimensions such as “limited institutional capacity and aid dependence” (Jules and Ressler, 2016, p. 30) as evidence of small states’ vulnerability. Some small states’ reliance on a single export for income has led to these nations’ characterization as being particularly vulnerable to external market fluctuations and shocks (Bacchus, 2008; Brock and Crossley, 2013). Moreover, small population size may prohibit small states from participating in economies of scale (Brock and Crossley, 2013). Baldacchino (2011) describes “small scale syndrome” as a defining characteristic of small states and small economies, in that it gives rise to the dynamics of “intimacy, monopoly, and totality, with the only realistic exit option being emigration” (p. 461). It has been argued that this particular narrative originated and is primarily perpetuated outside of small states themselves and tends to rely on stereotypical imaginaries of small states (Baldacchino, 2011).

Several essential considerations emerge in literature around small states’ strengths in responding to geopolitical and economic challenges: adaptability to change, the geostrategic projection of smallness, and the emergence of transnational coordination (Crossley and Sprague, 2017; Jules and Ressler, 2016). Frequently, small states, microstates, and particularly SIDS, are the first to experience the effects of climate change. Crossley and Sprague (2017) argue that “this ‘sharp end’ experience has positioned small island states as forerunners in the development of new ideas, approaches, and technologies to combat these challenges” (p. 44). Indeed, the “sharp end” experiences of small states have resulted in an increasing number of small states engaging with cross-sectoral approaches to sustainable development, including incorporating UNESCO’s Education for Sustainable Development (ESD) goals (Crossley and Sprague, 2014). The “Islands of Inspiration” report commissioned by the Commonwealth focuses on contextualizing good practices in small state education systems that seek to incorporate ESD goals. A similar argument is discussed by Jules and Ressler (2016) when they point to typical small-state behaviors like adaptability, strategic flexibility, and informality being invoked during times of crisis. Many small states have exercised their relative systemic flexibility to adapt to emerging crises better than larger states (Jules and Ressler, 2016). Additionally, Jules & Ressler (2016) argue that it is crucial to investigate how small states define themselves. Often, small states project smallness only when it is advantageous for them and do not necessarily identify as “small” otherwise (Jules and Ressler, 2016). This projection has been used in instances of cooperation where several small states share knowledge and resources to develop regional solutions to problems (Jules and Ressler, 2016). Several studies argue that much can be learned from reframing discussion of these challenges from chronic vulnerability toward investigating how small states respond to changes and threats (Brock and Crossley, 2013; Crossley and Sprague, 2017; Jules and Ressler, 2016).

It is clear from recent literature on small states that a new conceptualization of “smallness” that departs from the orthodoxy of the vulnerability or deficit discourse is necessary. A new model of analyzing small states in policy research could recognize the particular challenges that small states face, indicate their strengths, contribute to international policy discourse, and avoid over-generalizing the similarities between small states.

Historiography of small states research: deconstructing the different generations of small states studies

Given the lack of a clear definition of what constitutes small states, Jules and Ressler (2017a,b) argue that small states’ research can be broken down into “first generation studies,” and “second generation studies,” which are not chronological. *First generation* or “orthodoxy studies” are trapped in the vulnerability thesis, which exhibits the notion that small states are “special cases” for investigation. Spearheaded by “the international community that developed an interest in the explosion of smallish sovereign units onto the world stage after the 1940s” (Baldacchino, 2011, p. 458), small state research began with the September 1957 conference of the International Economics Association. Under this thesis, colonialization has created a high degree of conformity and distinctively open economies, and thus, until the formation of the World Trade Organization in 1995, small states had been able to utilize the networks of their former colonizers to secure preferential market treatment for their goods. However, “while this may be true, for example, within the Commonwealth grouping, it does by far not apply to all states that can be considered small based on certain formal criteria like population size” (Jules and Ressler, 2017a,b, p. 21). This line of inquiry often emphasizes how post-colonial societies of the South are poor, fragile, and vulnerable, and victims of an oppressive global economic system. In essence, these small states’ studies centered on population size, ecology, vulnerability to external shocks, limited human and natural resources, nature of their economies, cost per capita of services, and dependence on trade or tourism, and established that smallness was vulnerable and fragile (Briguglio, 1995; Bune, 1987; Jules, 2012; Holmes, 1976).

The work of the 1985 Pan-Commonwealth meeting resulted in the influential publication of *The Challenges of Scale* (Bacchus and Brock, 1987). In education, the work of Bacchus and Brock (1987) was the first to look at the “behavioral characteristics” of smallness by focusing on the economic impediments of development in areas like South-South migration (Bartlett, 2012); the politics of education in small states (Brock, 1988; Grant, 1993); size and survival (Lewis, 1976); implications of smallness for educational development (Bray and Fergus, 1986; Atwood and Bray, 1989); the role of indigenous knowledge development and values upon the policy process (Holmes and Crossley, 2004); expansion, improvement, and equality in education (Bird, 1984; Grant, 1987; Payne, 1980); the impact of isolation and dependence (Brock, 1984); research, institutional and evaluation capacity building (Crossley, 2008; Crossley and Holmes, 1999; Louisy, 2001); financial and human capital limitations (Jules, 1994); the impact of donor aid on local decision-making (Jules, 2006, 2010; Louisy, 2001); adult education in small states (Jules, 2006); higher education financing (Baldacchino and Farrugia 2002; Nkrumah-Young et al., 2008); cooperation and collaboration (Jules, 2008, 2012), and post-socialist transformation (Jules, 2014). These works shaped and perpetuated the vulnerability narrative while recognizing only a few strengths given that they tend to focus on “political and formalistic definitions of ‘capacity’ and ‘capacity building’” (Baldacchino, 2010, p. 65).

The first-generation studies used economic vulnerability as the critical measurement of “small size, insularity and remoteness, proneness to natural disaster, environmental factors, and other characteristics, such as demography and external dependency” (Jules and Ressler, 2016, p. 24) and thus characteristic of small states. In the words of Baldacchino (1995), illustrative concepts of smallness syndrome have

included vulnerability, scarcity, combustibility, non-viability, indivisibility and intimacy; while the metaphors of an overcrowded barracoon; a ship-wrecked community; a skeleton crew; a phoney terrestrial paradise; the flotsam and jetsam of empire; forlorn peripheries always meant to be part of something larger; boats set adrift; or envious paragons of beauty and democratic consensus, are poignant and evocative. (p. 264)

While many first generation studies are rooted in the perception of the weakness inherent in small states as they sought to respond to both endogenous and exogenous influences, a few scholars have focused on the ecology of smallness by highlighting that “insularity, smallness of scale and remoteness of location combine in different degrees ... to further promote locale-specific educational situations, the problems associated with them being less amenable to resolution through theories and methods developed from the experience of larger industrialized nations” (Brock, 1990, p. 3). Such locale-specific educational problems stem from the fact that “the style of educational development ... [in small states] is too frequently modeled on what is appropriate and fashionable in large states” (Commonwealth Secretariat, 1986, pp. 5–6).

Part of the reason for this limited scope of first-generation studies is the conceit that small states are often perceived as having to overcome smallness, territorial compactness, monocrops, and monoservice economies. First-generation studies did not identify educational advantages that small states possess, such as territorial compactness and economic diversification in executing educational policy reforms. Rather, these advantages were often downplayed, and the focus became on scale, isolation (spatial, political,

social, and cultural), dependency (economic, cultural, and educational), and remoteness (Brock, 1987). Yet, these characteristics have allowed small states to combine cooperation and small scale in education to establish and achieve the provision of tertiary education through entities such as the University of the West Indies (established in 1948 with 17² contributing members) and the University of the South Pacific (established in 1968 and jointly owned by the governments of 12³ member countries). In first generation research, such accomplishments, which are unique as these are the only two universities in the world to be jointly owned and simultaneously operated by several governments, are not marked as small state exceptionalism. Similarly, small states in the Caribbean have used cooperation to set up regional assessment and examination bodies such as the Caribbean Examination Council (CXC) and regional planning projects and programs such as the Pacific Regional Initiatives for the Delivery of Basic Education (PRIDE). First generation studies often overlooked the development of indigenous or regional models as their focus was on showing that small systems are prone to “incoherence in policy making” (Rodhouse, 1987, p. 30), thus leaving them exposed. Moreover, first generation scholars highlighted that limited capacity is exacerbated by power asymmetry and how smallness reduces competition and gives rise to monopolistic or oligopolistic arrangements in the marketplace rather than stressing the benefits derived from informality, intense personalization less hierarchical societies (Baldacchino and Wive, 2020).

In the second generation studies, small states’ definition is developed beyond measures such as population, landmass size, and vulnerability. Attention is placed on resilience and flexibility rather than vulnerability, since vulnerability implies that a state has little or no control. For instance, what constitutes vulnerability is frequently inadequate, and in certain respects, some small states are not more vulnerable than many big states. Moreover, vulnerability is a somewhat subjective concept that is often ideologically charged and deeply embedded in prevailing notions of (Western) progress. In this way, second generation studies move from *priori definitions* to *posterior conceptualizations* of smallness by problematizing concepts such as size and scale and offering evidence of a “small scale syndrome” (Baldacchino, 1997), which is based on a “syndrome of behavioral issues” (Baldacchino, 2012b). Instead, second generation studies concentrate on the role of globalized nation-states and their trading status – both intraregional and inter-regional – to emphasize GDP and resources spent in trade. In other words, second generation studies move away from the vulnerability and fragility thesis and place attention on the strengths of smallness “while at the same time recognizing the consequences of the fragilities and vulnerabilities that many small states possess as part of their inherited material baggage” (Jules and Ressler, 2017a,b, p. 24). Second generation scholars recognize that

globalization has proven to be a double-edged sword for small states allowing most of them to boost trade and avoid poverty, but at the same time increasing vulnerabilities and dependency for many as a consequence of unconventional security risks stemming from mass migration, terrorism, money laundering and environmental degradation.

Baldacchino and Wive (2020, p. 2).

These studies draw attention to how small states use forums such as South-South cooperation and transfer and mechanisms such as soft power to project a stature of influence to garner diplomatic leverage (Baldacchino, 2000). Scholars under this paradigm recognize that in an era of hyperconnectivity, the “deficit discourse” (Baldacchino, 2012a) and the “economic vulnerability index”⁴ – which measures small size, insularity and remoteness, proneness to natural disaster, environmental factors, and other characteristics, such as demography and external dependency – (Briguglio, 1995) are obsolete since large populations are no longer confined to particular spaces, topographies, and ecologies (Baldacchino, 2012b). They aim to highlight how small states use “strategic flexibility,” which asserts that many small states develop nimble responses to both threats and opportunities in a rapidly changing global environment (Baldacchino, 2012a,b; Briguglio, 1995). Thus, they argue that it is quite possible that “small states thrive in the modern global order” (Baldacchino and Bertram, 2009, p. 142) as they can in providing “niche-filling export strategy, flexible specialization, enhanced entrepreneurship and economic deregulation” (Briguglio, 1995, p. 1624).

Given that most small states exist as part of a geographical typology, second generation studies draw attention to how new hemispherical and regional players, such as customs unions, regional trade agreements, and “trans-regional regimes” (Jules, 2012) and the shift from “inter-regionalism” – the relationship between two distinct, separate regions – to “trans-regionalism” – that is, common “spaces” between and across regions that constituent agents shape (e.g., individuals, communities, and organizations (Dent, 2003)) – is reorganizing the ways in which we think about small states. In some cases, small states eschew globalization trends to pursue multilateralism at the regional level. Here we can see regional states amplifying their own educational initiatives. This multilateralism can be referred to as educational exceptionalism, wherein small states come together to create a “policy space in which educational policies, performances, and practices are inhabited at the regional level” (Jules, 2015, p. 2). In the second generation, scholars “accept that there is no unified definition of small states in an interconnected world where large populations are no longer confined to particular spaces, topographies, and ecologies” (Jules and Ressler, 2017a,b, p. 24).

²Contributing countries are Anguilla, Antigua, Bahamas, Barbados, Belize, Bermuda, British Virgin Islands, Cayman Islands, Dominica, Grenada, Jamaica, Montserrat, St. Kitts & Nevis, St. Lucia, St. Vincent, Trinidad and Tobago, Turks and Caicos. There are five campuses - Mona, Jamaica in 1948; St. Augustine Trinidad in 1960; Cave Hill, Barbados in 1963; Open Campus in 2008 and the Five island Campus in 2019.

³These are the Cook Islands, Fiji, Kiribati, Marshall Islands, Nauru, Niue, Solomon Islands, Tokelau, Tonga, Tuvalu, Vanuatu and Samoa. The main campuses are Laucala, is in Fiji, the Alafua Campus in Samoa the Emalus Campus in Vanuatu.

⁴The Economic Vulnerability Index is composed of trade openness, export concentration, dependence on strategic imports and peripherality.

The political ecologies of small states have been shaped by existential threats such as structural adjustment programs (SAPs), which saw the imposition of externally driven modules of development as a way to achieve images of Western modernity. Small states are indeed vulnerable to external shocks, but how they respond makes them a special case for studying. As such, second generation scholars have sought to move the pendulum away from fragility and vulnerability (e.g., economically or ecologically) and toward flexibility and strategic alliances; there have been new conceptualizations of what it means to be viewed as a small state. While smallness is often based upon institutional constraints in that

[A] small state is a state that either believes it is small, and/or else is seen to be one, and is expected to behave accordingly; also because of its historical unfolding and resource availability. '[Q]uite convincingly, it can be argued that a state is 'small' when it feels and acts small – implying that it could become smaller or less small at different points in its history.

Baldacchino (2012a, p. 31).

Jules and Ressler (2017a,b) advance that small states use “geostrategic leveraging” to rely on networks to constrain their efforts on the best possible solutions. Educational geostrategic leveraging refers to “the use of soft power grounded in strategic-level bargain and cooperation at the national level to achieve regional consensus” (Jules and Ressler, 2016, p. 28). This implies using soft power grounded in strategic-level bargaining and cooperation to project the perceived notion of smallness and fragility when it is strategically advantageous. In this way, size is viewed as providing states with opportunities since “decision-making and adaptation may be easier where there is a small population and shorter lines of communication” (Keating, 2021, p. 224) and “small state citizens may need to seek out and grasp every opportunity for purposeful economic activity” (Baldacchino, 2011, p. 457).

There is also a growing recognition that while small states may not have military strength or research capability, they may have opportunities that their larger neighbors may not. For example, they may be able to innovate and respond flexibly and rapidly to shifts in the external environment. Moreover, small states, especially islands, are the first to experience the impact of climate change. In this area, there is a lot that researchers can learn from small states and their strategies to cope with climate challenges. Thus, small post-colonial states are now global players.

An ecology of educational policies and priorities in small states

Small states face challenges that have essential impacts on these states’ education policies and provide valuable insights into potential responses to these challenges. The “social ecology” of these societies is such that they are “closely knit, integrated but open communities with highly personalized relationships” (Farrugia and Attard, 1989, p. 17). While small states are more responsive to educational reforms given their size, educational specialists in small states need different skills from their counterparts in larger states. Although various factors shape small states’ priorities in education, policymakers and planners may become dependent on external actors. The primary educational challenge for small states is providing quality education for a small number of students. Small states tend to exhibit a higher unit cost in their public expenditure devoted to education. They also lack local research capacity building. Several scholars have extensively discussed how resource dispersal issues, lack of capacity, institutional coordination, absence of professional collaboration, local research and evaluation, tensions between local educational content and international expectations, and barriers to information and communication technologies have challenged educational provision in small states (Baldacchino, 2010).

A significant criticism of education difficulties in small states is that these challenges stem from a system developed through pervasive colonial penetration and a peculiar colonial administrative legacy. Educational developments in small states are a product of Western colonization that was metropolitan orientated, and “governments have criticized the alien educational system they inherited with political independence: ‘Like Ruth amidst the alien corn’” (as cited in Baldacchino, 1995, p. 272). Bacchus (2008) points to the small population size limiting career opportunities and demand for workers with high education levels. While the number of trained personnel is limited, most external educational projects rely on foreign technical experts who do not know small states’ social and cultural roots. The “blocked mobility” (Bacchus, 2008) that characterizes small states’ career landscape causes highly educated people to pursue jobs in larger or more developed states. This trend extends into the teacher workforce that small states have available to them (Edwards-Gums, 2014). Trained teachers in small states may be recruited by large states with higher economic capacity and mobility, which severely limits small states’ ability to retain trained teachers (Edwards-Gums, 2014). In Anguilla, for example, much of their teacher workforce is made up of high school graduates who view teaching as a stepping stone for other career paths making teacher turnover and finding trained teachers a major issue (Edwards-Gums, 2014). First generation studies have maintained that relationship among individuals in small states tends to be communal instead of associational (Bacchus, 2008). This has consequences for education as well. First generation scholars view education as a means of improving cultural and material wellbeing as well as instrumental in endangering the social and economic mobility of the poor. Education in small states is therefore viewed as multipurpose.

The challenges associated with limited population are compounded by the population distribution trends in some SIDS, mainly where populations are scattered across large internal distances or several different islands, which affect educational provision. This distribution makes educational resources and infrastructure challenging to reach all populations (Bacchus, 2008). Other problems that come from the limited population include, but are not limited to, restricted internal markets for the products of small states,

difficulty in attracting investments or receiving loans (which comes with their propensity to remain poor and inability to provide the quality of education needed), uneven spending of public funds in urban areas in contrast with less populated areas (which creates difficulty to provide quality education in suburban and rural areas) (Bacchus, 2008). Given that small states have sometimes been characterized as economically vulnerable because of limited internal markets, high levels of income inequality, and reliance on tourism or a single major export which may be devastatingly disrupted during periods of global crisis or climate change, all have implications for these states' ability to fund and sustain their education systems (Bacchus, 2008).

The tendency of international discourse and literature to emphasize small states' vulnerabilities has led to a problematic view of these entities as passive recipients of global "best practice" and uncritical policy transfer (Baldacchino, 2011; Brock and Crossley, 2013; Jules and Ressler, 2017a,b). Prince (2012) argues that policy transfer frequently acts as a normative project where external, private sector consultants are increasingly tasked with making links between hegemonic projects and other nation-states. This kind of policy transfer has resulted in a lack of educational policies that are relevant and sensitive to the particular contexts and landscapes of small states (Baldacchino, 2011; Brock and Crossley, 2013). Education systems are essential for their economic growth, and "most small states have to depend on their human resources as the main factor in their production efforts and therefore the quality of these resources is key to their economic growth. A major consideration in preparing high quality resources for their labor force is their educational systems" (Bacchus, 2008, p. 132). Indeed, small states often achieve lofty global education development goals like accessibility and gender parity earlier than their larger counterparts (Crossley and Sprague, 2014). As such, reframing education policy discussion in small states is an essential step in moving away from a deficit discourse and exploring how the international community can learn from these countries (Brock and Crossley, 2013). Here we suggest that small states have responded to the challenges associated with their size and geographic realities in education policy by embracing regionalism, new mutualism, cooperative educational transfer, and educational geostrategic leveraging.

Recent literature on policy responses of small states suggests increasing participation in networks engaging with "new regionalism," or 'open regionalism' centered on open membership, regional and global trade liberalization, trade facilitation, and the inclusion of regional level into the global market" (Jules, 2012). New regionalism also departs from more traditional modes of cooperation between regions and moves toward cooperation within regions (Jules and Ressler, 2016). This new regionalism has implications for education policy in small states as well, as education governance moves away from states as the sole legitimate education authority and toward regional bodies. Regional educational bodies provide opportunities for the "mitigation of transactional costs, sharing of policy best practices and techniques, and dissemination of information" (Jules and Ressler, 2016, p. 32). The kind of regionalism documented among small states is characterized by new mutualism operationalized through cooperative educational transfer. New mutualism is the idea that the pooled resources of states forming a regional body will facilitate "regional solutions to national problems in an era of enhanced regionalism" (Jules, 2012, p. 270). Central to new mutualism is the process of cooperative transfer, which allows for national policy responses and best practices to be shared at a regional level and subsequently disseminated back to the national level through regional directives or benchmarks (Jules, 2012). In the Caribbean, the Caribbean Community (CARICOM) visibly engaged in new mutualism and cooperative transfer in their education policy response to the HIV/AIDs epidemic as multisectoral regional mandates shaped national reforms. Small states have adopted a similar model in the South Pacific through their Educational Quality and Assessment Program, which seeks to align educational approaches, practices, and goals across different member states (Educational Quality and Assessment Program, 2019). New mutualism offers a framework that explains several education policy responses in small states and aligns with increasingly important regional education bodies and goals.

It has been documented that many small states engage in geostrategic leveraging as a part of new regionalism and cooperative transfer (Jules and Ressler, 2016). Thus, small states use their comparatively flexible institutional and bureaucratic systems to strategically adapt to global changes in education areas. In many cases, smallness makes it easier for these states to reach specific educational benchmarks since "the small scale of their education systems has enabled many small states to move ahead relatively rapidly in terms of many of the international targets established for basic education" (Brock and Crossley, 2013, p. 399). These strengths position small states to attract investments, diversifying single-export economies that have typically been considered a significant vulnerability. In these ways, educational geostrategic leveraging demonstrates that the strategic thinking that small states engage in is often ignored in small state literature and indicates how small states are equipped to respond to external forces.

Much of the recent literature on education policy in small states argues that the international community can learn how small states respond to challenges through policy (Brock and Crossley, 2013; Crossley and Sprague, 2014; Jules and Ressler, 2016). Small state research that participates exclusively in the deficit discourse has historically surrounded small states ignores how smallness has been integral in many states' ability to respond to changing economic, political, and environmental landscapes. Additionally, the emphasis on vulnerability and corresponding tendency toward uncritical policy transfer limits broader international discussion about how policy, benchmarks, and success metrics are determined and implemented. Brock and Crossley (2013) argue that the distinct "small state experience can help to caution against the similar replication of a new set of fixed, universal and inflexible educational goals and targets" (p. 399) that have been typical of global educational policy discourse. Educational policy research surrounding small states must rigorously engage with new forms of collaborative governance, attention to contextual nuance, and grapple with changing definitions of scale.

In response to the multipurpose nature of education in small states and the developing smallness syndrome, regional cooperation in education or "educational regionalism," particularly in the small states of the Caribbean, has emerged as there has been a movement from an idea of national development and nation building, toward the notion that modernization comes through

regionalism and economic coordination. Today, small states realized that they must band together to fend off existential threats, and economic regionalization in functional areas, such as health, education, and transportation, has emerged as a way to define small state exceptionalism. Participation in regional projects is seen as engendering educational cooperation as educational developments in small states are now seen not as nationalistic instruments but as regional projects. Regional cooperation in education acts as a buffer against economic exploitation.

Conclusion

It is important to remember that small states are not just “scaled-down varieties” of large states. This chapter discusses the historical legacy and explanatory factors influencing small states, which tend to occupy a marginal position in global affairs and are often only heard once they band together. This chapter ultimately suggests that there are two generations of research on small states. The first generation focuses on almost exclusively on the vulnerability narrative, and the second generation pays attention to the strengths of small states. It then considered education in small states by paying attention to the challenges that small states face and how they have sought to overcome these, given that many small states suffer from economic vulnerability and are prone to external economic shocks. While the structures and constraints faced by small states, which are often ex-colonial states, are the same as those faced by larger states, what differentiates the two is how small states can circumvent these challenges. As Bacchus (2008) reminds us, the movement toward deeper economic globalization driven by the information age and knowledge society has only dismantled trade barriers and preferential systems that small states relied upon. The rise of the so-called fourth industrial revolution – which blends the physical with the cyber-physical and the “educational intelligent economy,” which is viewed as “the exponential production of digital data to measure, analyze and predict educational performance in comparative perspective” (Salajan and Jules, 2019, p. 1) – has had drastic consequences for educational developments in small states. No longer can small states choose to be insular or play second fiddle to other states. Instead, they must exert pressure where necessary and maximize their human development capacities. While the level of education is often higher in small states, and some small states have found success in educating human infrastructure for the global service economy through expanding access to basic education, they continue to struggle with producing quality education.

While several small states have met the poverty alleviation agendas and EFA and MDG objectives, many have a ways to go while working on SDG goals. Most small states have been marginalized from shaping international educational agreements in the last decade. For countries where data exists, many small states have net primary enrollment rates of over 90% but still face challenges of access and equity. With the advent of the knowledge economy and the transition to the educational intelligent economy, there has been a demand to expand education in small states. Today, small states must walk a fine line between promoting national values at home to engender development and promoting cosmopolitan values abroad (Baldacchino and Wive, 2020). With the rise of the educational intelligent economy, educational developments in small states will rely on their human resource development. As Bacchus (2008) reminds us, “small states will only be able to survive economically and culturally if their populations receive an education that helps them to perceive new opportunities and provide them with the competencies and dispositions that would equip them to adapt readily to the changing social and economic world environment” (p. 142). In this way, small states today need to have a higher degree of flexibility since they cannot change their size and disadvantages, given that they are on the global periphery and frequently rely on international aid. Finally, this chapter argues that small states are unique and require a distinctive category of analysis.

International organizations are central to the field of education, and particularly to the field of global education policy. Among other things, they are sources of policy and curricular ideas, provide leadership at various levels related to global goals and educational reform, engage in monitoring and evaluation of educational programs, offer financial and technical support for education projects, facilitate networks of education professionals, and partner with universities and schools to implement initiatives. Of course, international organizations can take many forms, and have many different missions. They can be multilateral in nature, as in the case of UN organizations, as well as bilateral, as in the case of international development agencies. They can also be a range of non-governmental or corporate organizations, such as think tanks, consulting and technology companies, philanthropies, or non-profit organizations with a social mission (e.g., Save the Children).

But regardless of the type of organization in question, it has been uncommon, or at least insufficiently common, for scholars in the field of education to bring theory to bear to explain the way these international organizations work. When we say “explain how they work,” we mean scholarship that theorizes what drives their activity, that is, theorizes what they do, their behavior, how they operate, and why. Because the work of international organizations focuses on policy in one way or another—whether making and implementing their own or contributing to the development and enactment of others’ policy—a discussion of international organizations’ nature and operation necessarily connects directly with this issue. However, it needs to be emphasized that we are not concerned here with explaining policy change, policy transfer, or policy borrowing at the country level or between international organizations. Rather, as noted, the discussion here is centered around characterizing theoretical approaches that shed light on the work of international organizations, though, of course, this work (of organizations) may have implications for policy movement more broadly. It should also be acknowledged that there are some theories that have been applied to both phenomena—that is, policy change within and beyond international organizations. In these cases, we will characterize the former (policy change within/inside the international organization) to the extent it is helpful to a discussion of understanding how the theory is applied to the latter (policy change beyond/outside international organizations).

Some scholarship does exist wherein theory has been applied, and a number of examples will be discussed in the sections that follow. Despite these examples, the point of departure for this entry is that there is a mismatch between the centrality and importance of international organizations, on one hand, and the extent to which theory is brought to bear in order to make clear how these entities are understood when it comes to their work, on the other. In other words, this entry takes as its focus those theories that attempt to explain international organizations because, it is argued, the idea of international organizations is routinely invoked but without making clear the theoretical assumptions or perspectives upon which authors are drawing when analyzing them. As one brief example, consider that the recent discussion of the “international architecture for education” by prominent scholars is characterized by a lack of engagement with theory that explains organizational behavior (e.g., Burnett, 2019; Heyneman and Lee, 2016; see also Benavot, 2011). This is a striking omission given that the entire purpose of this debate is, first, to diagnose what is wrong with how international organizations have carried out their work related to meeting international development goals and, second, to offer recommendations for how to improve their efforts going forward. However, while the omission is striking, is it not surprising, for it is a continuation of a larger trend where international organizations are discussed as actors involved in the politics

and provision of education but without a conceptualization of what it means to be—and what are the implications of being—an *organization*, nor any theorization of what guides their behavior.¹

Following from the above, the purpose of this entry is, first, to characterize a range of theoretical options for understanding the work of—and policy change within—international organizations, and, second, to argue for the benefits of a particular approach in that regard—known as the circuits of power model (Clegg, 1989). In addressing the first goal, the next section will characterize 10 approaches. The discussion of each approach will be relatively brief, given that this is an encyclopedia entry. The approaches over-viewed are intended to show the range of options available. They are indicative, not exhaustive. Moreover, they have been used by scholars of comparative and international education. The characterization of each approach is followed by examples of their application. As will be seen, examples focus on multilateral organizations such as the European Union; the Organization for Economic Cooperation and Development (OECD); the United Nations Education, Science, and Culture Organization (UNESCO); the United Nations Children's Fund (UNICEF), and the World Bank, since these are the organizations on which research has been conducted that provides insight into the issues of interest here. It is hoped that this entry can serve as a resource for those interested in international organizations, a resource that fills a gap in the existing literature by clarifying and bringing together in one place multiple options for theoretically approaching the work of international organizations.

In addressing the second purpose, this entry draws on organizational theorist Stewart Clegg, who developed the circuits of power approach in order to combine and to go beyond the core characteristics of many approaches to organizational change (Clegg, 1989). We see this approach as having certain benefits, particularly in the way that it is able to address the interaction of such things as structure, agency, and discourse. As will be more fully discussed, this framework, in explaining the work of organizations, is attentive to the interplay of agentic action, social relations of meaning, organizational structure, and exogenous environmental conditions. In focusing on this approach, the goal is to encourage more nuanced scholarship that overcomes historical divisions related, for example, to a focus on either political-economic structures, shared cultural values, discourse circulation, or the initiatives of individuals acting alone, among other tensions discussed in what follows. In other words, we see Clegg's (1989) approach as advantageous in that it brings together and extends the benefits of these other approaches discussed in the next section.

Theorizing the work of international organizations: ten approaches

Organizational theorists note that organizations are created in order to enable people to work together to accomplish tasks that would not be possible without coordinated activity. In their seminal paper, originally published in 1963, Blau and Scott (2003) write that “if the accomplishment of an objective requires collective effort, men [sic] set up an organization designed to coordinate the activities of many persona and to furnish incentives for other to join them for this purpose” (p. 175). Theoretically, however, there are divergent, though not necessarily mutually exclusive, perspectives on how to understand the behavior of these organizations, as discussed below. When it comes specifically to international organizations, four of the most prominent approaches, at least in the field of education, are World Culture Theory (WCT), international political economy (IPE), cultural political economy (CPE), and international relations/global governance. In addition to these, the next section discusses: historical and sociological institutionalism, principal-agent theory, institutional entrepreneurship, policy streams, organizational legitimacy, and science and technology studies (STS). These are then followed by a characterization of Clegg's approach in a separate section.

As the names of the approaches listed above imply, most of them are not rooted in organizational theory or do not emanate from the field of organizational studies. This is not seen as a weakness as the purpose of this entry is simply to map out approaches that have been used in the field of education to understand the work of international organizations. In accordance with this focus, we do not engage with deeper debates on how foundational sociological paradigms approach organizational analysis (for that, see, e.g., Burrell and Morgan, 1979; Clegg et al., 2006).²

World Culture Theory

In the field of education, WCT is commonly discussed in terms of how the spread of ideas has affected the ways that education systems are organized and in terms of what is taught. We will characterize WCT in relation to this area of application first and will then offer additional commentary on how organizations are theorized, before finally highlighting a few examples of the kinds of studies that look within international organizations.

¹Likewise, it is uncommon to theorize the way that international organizations engage with nation-states and other actors when trying to influence their policies. To this end, a recent systematic review of literature on the World Bank's influence on policymaking in education found that only 54% of the 77 studies analyzed clearly discussed their theoretical orientation (Edwards et al., 2021a).

²It should also be acknowledged that this discussion is related to but different from the discussion offered in a companion chapter entitled, “Globalization and education: Understanding and problematizing approaches to global governance and the global education policy field” (Edwards, 2021). The focus there was on characterizing diverse approaches for assessing the relationship between globalization and education in the field of global education policy. As such, that discussion, in addition to not having an exclusive focus on international organizations, was also centered around approaches that are broader in nature, in the sense that the kind of policy change of interest was not restricted to the context of international organizations. Thus, although three of the first four sub-sections below address approaches featured there, the discussion of these approaches here has been tailored to focus on their relevance and application to international organizations specifically.

Scholars writing within the WCT tradition see international organizations such as UN agencies and the World Bank as carriers of ideas that are freely taken up by nations around the world (Chabbot, 1998; McNeely, 1995; McNeely and Cha, 1994; Meyer et al., 1997; Ramirez et al., 2016). That is, from the perspective of World Culture Theory, through such avenues as international conferences and engagement with international organizations and their publications, policymakers at the national level are exposed to—and then adopt, as argued, often out of a desire to be seen as legitimate—prevailing ideas around what education systems should look like (Ramirez and Boli, 1987). This happens in the context of a “world society” composed of nation-states that have, especially in the post-WWII period, become increasingly dependent on seemingly rational, bureaucratic institutions, with the implication being that education is one among many sectors affected by this trend, a trend which, at foundation, is geared toward achieving “progress” and “modernization” through the spread and inculcation of liberal legal and cultural norms (e.g., primacy of the individual, consumption, faith in science, representative democracy, etc.) (Boli et al., 1985). When it comes to empirical studies of international organizations, World Culture scholars have tended to examine the extent to which educational policies, curricula, and textbooks reflect the ideas embedded in the discourse that is circulated in, through and by those international organizations (Chabbot, 1998; Kamens and McNeely, 2010). Differences between international ideas and globally circulated models, on one hand, and the forms they take at the national level, on the other, are attributed to “loose coupling” (Meyer and Rowan, 1977; Meyer et al., 1997).

The same assumptions of organizational imitation (i.e., “isomorphism”) for purposes of legitimacy are applied to international organizations as well. Writing on organizations generally—and not on national education systems specifically—Meyer and Rowan (1977), in their famous article, wrote that

organizations are driven to incorporate the practices and procedures defined by prevailing rationalized concepts³ of organizational work and institutionalized in society. Organizations that do so increase their legitimacy and their survival prospects, independent of the immediate efficacy of the acquired practices and procedures (p. 340).

This perspective on organizational behavior contrasts with the (functionalist) assumption that organizations “function according to their formal blueprints: coordination is routine, rules and procedures are followed, and actual activities conform to the prescriptions of formal structure. But much of the empirical research on organizations casts doubt on this assumption” (Meyer and Rowan, p. 342). In practice, and in contrast to the depictions of organizational charts, WCT stresses that “formal organizations are often loosely coupled,” meaning that their

structural elements are only loosely linked to each other and to activities, rules are often violated, decisions are often un-implemented, or if implemented have uncertain consequences, technologies are of problematic efficiency, and evaluation and inspection systems are subverted or rendered so vague as to provide little coordination.

Meyer and Rowan (1977, p. 343).

Whether or not organizations actually follow prevailing norms and expectations, they need to be perceived as doing so, for the sake of legitimacy, as noted.

More recently, Bromley and Powell (2012) have written on a related phenomenon, means-end decoupling. Even where internal systems, processes, and actions are tightly linked together, it may be the case that the activities of an organization (i.e., means) are misaligned with their stated goals (i.e., ends). It is suggested that this form of decoupling is growing in relevance in “an increasingly managerial world that emphasizes evaluation, standardization, and benchmarking, [whereas] the policy–practice form of decoupling may become less common” (Bromley and Powell, 2012, p. 3).

When it comes to research on international organizations, the WCT approach has been adapted through what Milana (2015) calls a global polity perspective in order to study, for example, the processes through which UNESCO “mobilizes” different education policies (p. 203). Milana (2015) highlights

three processes that cross geopolitical borders and professional interests: “landmarking”, by which a shared sense of a common past is created; “brokerage”, which helps shape a common future direction; and “framing”, which is used to convert ideational landscapes into material government-led actions (p. 203).

In these ways, UNESCO would be a source of “rationalized myths,” that is, narratives and expectations for education systems more broadly: “its work tends toward the homogenization of beliefs, guiding norms, values and ideas” (Milana, 2015, p. 210).

³Rationalized myths are accepted narratives “depicting various formal structures as rational means to the attainment of desirable ends” (Meyer and Rowan, 1977, p. 345).

Other studies have looked at decoupling within international organizations. Zapp (2019), for example, reviewed documents from 16 different international organizations during 2000–2015, revealing the “awkward entrenchment in the inconsistent goals of world culture: the formal celebration of cultural diversity, on the one hand, and the delegitimizing of such culture wherever it conflicts with the goals of equality and universalism, on the other hand” (p. 322). Zapp (2019) ultimately argues that international organizations are decoupled in that “their ceremonial commitments to culture and contextual adaptation of reforms are disconnected from their actual practices of promoting progressive cultural ideology and universalistic planning based on the premises of the social sciences” (p. 322). Elsewhere, Mundy and Menashy (2014) have drawn on the work of Bromley and Powell (2012) around decoupling to highlight “organizational hypocrisy” within the World Bank, where it is common to promote private schooling in rhetoric but uncommon to support related reforms through the day-to-day operations of the organization.

As a final point here, it is ironic that the studies that focus on the role of international organizations in creating or spreading norms that supposedly become or are globally-accepted, those same studies implicitly evince the importance of agency and material resources that a focus on cultural and rationalized myths historically sought to avoid. This is a tension to which the circuits of power approach responds, as discussed later.

International political economy

WCT has been critiqued for its lack of attention to the way that material power shapes organizational behavior (Carney et al., 2012; Downey et al., 2020). The contrasting perspective to WCT—known as IPE—takes this kind of power as its focus. However, just as with WCT, the use of IPE in the field of education has tended not to look *within* organizations. Rather, it has been more common to think about how organizational activity is connected to, or a consequence of, the larger political-economic structures within which it is embedded. As with the previous discussion on WCT, we characterize this broader, and more common, way of approaching international organizations from the perspective of IPE, before then drawing out the implications of this perspective for the internal work of such organizations.

For scholars operating within an IPE paradigm, the focus is on structure, power, and the nation-state as a site of negotiation among competing political and (capitalist) economic interests. Dale (2000), for example, in writing about what he labels the “globally structured approach to education” (GSAE), sees the role of the World Bank, through its loans and the attached conditions, as central to the settlement of national-level decisions related to education policy. When it comes to education, the important thing to note from the framework of GSAE, is that it (i.e., education) is at the heart of the process by which the government legitimates and generates consent to capitalist modes of production (e.g., through promises of education-based meritocracy and through the provision of the skills necessary to acquire jobs that will provide a decent quality of life). The role of the World Bank (and other institutions with similar ideology) is thus to promote (and to lobby for the acceptance of) policies that hold out the promise of improved education and certain outcomes (like enhanced productivity, increased employment, national competitiveness, etc.) without challenging the capitalist system of which the education sector is a part (Bonai, 2002). Scholars grounded in the general paradigm of IPE tend to examine the power-dynamics, processes, and structures that characterize the interaction of the World Bank and its government counterparts, as well as the pathways through which the World Bank is able to exert its influence (see, e.g., Edwards et al., 2021a; Moutsios, 2009, 2010; Samoff, 2004, 2009).

When shifting to look within international organizations from an IPE perspective, emphasis is still placed on understanding how larger-political economic structures affect behavior (Broad, 2006). Studies here question, for example, the extent to which international organizations should be seen as a “vector of the interests of their member states” (Wade, 1996, p. 5). For example, insightful studies have spoken to the extent to which World Bank policies, publications, knowledge production are shaped by whether or not they align with the accepted perspectives and paradigms for discussing international development, that is, the extent to which they align with the preferences of powerful actors (such as the US Treasury) who benefit from the reproduction of dominant approaches to development (Broad, 2006; Downey et al., 2020; Wade, 1996).

In the field of education, IPE’s preoccupation with political-economic structures has similarly led to studies that focus on how international organizations are able to use the material resources available to them to promote their ideologies (Edwards, 2018b; Klees, 2012; Mundy, 1998; Steiner-Khamsi, 2006). The World Bank has again been the subject of study from this perspective, perhaps unsurprisingly, given its prominent position in the field of global education policy and the fact that it is the largest international development organization—both in terms of its staff and in terms of the financial-technical resources available to it (Gilbert and Vines, 2006). Studies in this area have highlighted the way that the World Bank has been able to use its resources not only to produce research and other publications on an incredible scale (Klees and Edwards, 2014; Samoff, 1993) but also how it has been able to use its resources to leverage those studies globally (Edwards, 2018a; Edwards and Urquilla Loucel, 2016; Edwards et al., 2020) and to structure processes for participation by other international organizations (Bermingham, 2011; Verger et al., 2014).⁴ Importantly, this focus on how the production of knowledge and discourse affects subjective perceptions has been (more explicitly) taken up by a variation of IPE, discussed next.

⁴Interestingly, IPE’s focus on material resources overlaps here with Foucault’s emphasis on how the production of discourse leads to acceptance of certain ways of seeing the world (Clegg et al., 2006; Foucault, 1980).

Cultural political economy and the strategic-relational approach

In the past 20 years or so, scholars of political economy have been attentive to the absence of attention to the cultural dimension, that is, to how meaning is made and how commonly-shared meanings affect behavior. Increased attention to this area has led to a cultural turn in this field under the label of CPE. Jones (2008) writes that CPE is an extension of the Marxist tradition that explores “relations between the cultural (the world of *discourse and practice*), the political (actors and institutions) and the economic” (p. 1, emphasis added). Some scholars advancing CPE focus primarily on the production of discourse and meaning (semiotics)—within larger political-economic structures—and the way that actors interpret that discourse (Jessop, 2004). To that end, CPE introduces the issue of strategic selectivity, or what Jessop (2001a) labels the strategic-relational approach.

Per Jessop (2001a), individual policy actors, informed by discursive trends, participate in reform processes, in spaces where decisions are made, and in agenda-setting while engaging in structurally-oriented strategic calculations in that they analyze and take into account their institutional and political constraints and opportunities and subsequently “orient their strategies and tactics in light of their understanding of the current conjuncture and their ‘feel for the game’” (Jessop, 2001a, p. 1224). The point, then, is that, in extending the focus on ideas mentioned in relation to IPE (Hay, 2002), CPE makes an attempt to be less deterministic than IPE by emphasizing the role of individual agency, though that agency is still circumscribed by political-economic structures, by the vested interests of organizations, and the discursive context in which they are located (Jessop, 2010). The goal is to go beyond an analysis of policies as subject to political and economic constraints (already addressed by the IPE approach) to address as well the ways that policies, in practice, are brought to life in cultural contexts (including within organizations) that are imbued with their own “operational logics or instrumental rationalities” (Jessop, 2001b, p. 290). As will be further discussed later, these assumptions are also shared by the circuits of power approach (Clegg, 1989).

The CPE approach has been applied to the organizational context of the European Union. Through this approach, Jones’ (2010) study, for example, sought to accomplish the following:

to account for and explain the questions of why and how particular kinds of cultural, political, and economic processes develop at the [European Union] scale, the role that actors, institutions, and their mobilization and contestation of discourse play in these processes, and the extent to which the cultural, the political, and the economic are mutually constitutive in conditioning what happens within multilevel governance. In taking seriously the importance of actors and institutions, their discourses and practices, [cultural political economy] would clearly seek to place them in relation to the structured complexity of bigger economic, political, and social processes within the [European Union] (p. 34).

As can be seen from these goals, the CPE approach is demanding in analytic terms. However, where successful, its application can lead to nuanced insights. In the case of Jones (2010), CPE’s value was in that it offered:

a way to think about the extent to which: (1) the EU is becoming a site at which the governance of education is achieved; (2) the political context of the activities, including the discursive, which are pursued at this level; and (3) the importance of both the discourses and the realities of the economic context within which education reform can be pursued at the EU level (p. 38).

By shedding light on these dimensions, CPE manages to capture the whole policy translation process, including the emergence of different policy options (variation), which options are privileged (selection), and which are ultimately taken up for implementation (retention; Jessop, 2010).

International relations and global governance

A fourth group of scholars approaches international organizations through the lens of international relations and global governance (Barnet and Finnemore, 2005; Jakobi, 2009; Jones and Coleman, 2005; Jones, 2007a,b; Mundy, 2007). While there are multiple camps within international relations theory, the most basic two are idealist and realist in nature, with the former focusing on (or assuming) the inclination of nation-states to work together through organs of global governance (e.g., the United Nations) to make progress on liberal priorities (e.g., democracy, safety, health, universal education, etc.), while the latter has presumed independence and inherent conflict among states and, within the realm of global relations, “the pursuit of national interests in contexts of very uneven distributions,” including through multilateral organizations such as the World Bank (Jones and Coleman, 2005, p. 9). A third international relations perspective is neo-Marxist in nature and draws on world systems theory (Wallerstein, 1984). These scholars depart from a preoccupation with the capitalist world system and the way that nation-states occupy either core or peripheral positions within that system. From their privileged positions in this system, core nations use international organizations to their benefit and to extend the capitalist economic system (Mundy, 2007).⁵

However, since the 1990s, following the end of the Cold War, there has been a shift in the discussion by international relations scholars toward global governance (Mundy, 2007). The point is that, independent of nation-states, there is “an evolving set of processes and interactions ... that by definition involves heterogeneous private and public actors at multiple levels or scales of

⁵As can be seen, the world systems approach has much in common with—and indeed can be considered a form of—IPE analysis.

action: local, national, international, and transnational" (Mundy, 2007, p. 343). Within this space—which has been conceived as a global policy field in education (Lingard et al., 2005)—“multilateral organizations are seen as world actors in their own right, behaving as distinct components of global power relations and not merely as functional extensions of the systems that gave rise to them” (Jones and Coleman, 2005, p. 4; see also Barnett and Finnemore, 2005). A seminal study by Jones and Coleman (2005) has applied this perspective to explain the behavior of UNESCO, UNICEF, the United Nations Development Program, and the World Bank. Such research focuses on how “forms of international authority [grounded in norms and rational, bureaucratic organization] are socially constructed and historically contingent, rather than materially or historically fixed” (Mundy, 2007, p. 351). A number of studies beyond Jones and Coleman (2005) have also looked at the World Bank in order to explain its inner workings over time as well as changes to its position vis-à-vis other multilateral organizations (Jones, 1992, 2007a,b; Mundy, 2002).

Some recent scholarship that falls within the global governance umbrella shows that there is a point of connection between this approach, IPE, and CPE. For example, in drawing on critical constructivism (with its assumption that portrayals of reality reinforce actual power structures) and CPE (which is interested in how economic and political imaginaries are translated and institutionalized in structures), Verger (2014) emphasizes that such actors as the World Bank are key in global governance because of their ability to project visions of the world, to define problems that need to be solved, and then to mobilize ideas around which models are appropriate for solving those problems. This approach has been utilized to explain how the World Bank has framed and sold the idea of public-private partnerships in education (Verger, 2012; see also Samoff, 2012). We will discuss further below how the global governance perspective also connects with theorizing related to institutional entrepreneurs.

Historical and sociological institutionalism

Scholars of international relations, political science, and sociology have advanced different forms of institutionalism (Hall and Taylor, 1996). This section focuses on two variants: historical and sociological institutionalism. The first—historical institutionalism—is characterized by “attention to large questions with an explicit temporal scope that concern the creation, reproduction, development, and structure of institutions over time” (Fioretos, 2011, p. 372). Here, institutions are understood as

the formal or informal procedures, routines, norms and conventions embedded in the organizational structure of the polity or political economy. They can range from the rules of a constitutional order or the standard operating procedures of a bureaucracy to the conventions governing trade union behaviour or bank-firm relations.

Hall and Taylor (1996, p. 938).

More specifically, while taking into account pressures from the organizational context (e.g., developments in the global education policy field, such as the Sustainable Development Goals), historical institutionalism investigates how “periods of continuity [are] punctuated by ‘critical junctures’, i.e., moments when substantial institutional change takes place thereby creating a ‘branching point’ from which historical development moves onto a new path” (Hall and Taylor, 1996, p. 942). Finally, historical institutionalism is “attentive to the relationship between institutions and ideas or beliefs,” meaning the way that organizational arrangements reinforce certain ideas (e.g., in the case of the OECD, the way that its organizational arrangement has come to reinforce the Program on International Student Achievement, PISA) (Hall and Taylor, 1996, p. 942). As an additional example, historical institutionalism could be used to study how and why the OECD and the World Bank have changed their practices, rules, and even structures to work together in the 2010s to adapt PISA for low- and middle-income countries.

Studies that draw on historical institutionalism engage case study methods (interviews and archives) to produce “theory-guided narratives” (Capoccia and Keleman, 2007). These narratives center, first, on explaining critical junctures and “the main actors, their goals, preferences, decisions, and the events that directly influenced them” (Capoccia and Keleman, 2007, p. 357). Second, these narratives “reconstruct the consequences of the decisions that were taken” (p. 357). Importantly, these narratives explain how, during periods of “institutional fluidity,” influential actors “steer outcomes toward a new equilibrium ... in order to enhance their own position” (p. 354). As these quotes suggest, and in accordance with the strategic-relational approach discussed previously, historical institutionalism assumes that actors (i.e., individuals and groups within organizations) are knowledgeable, agentic, and reflexive, and that they “routinely (often intuitively) monitor the consequences of their action” (Hay and Marsh, 1999, p. 956). Moreover, in so doing, they “assess both the immediate and unfolding impact of their prior strategies in relation to earlier intentions and anticipated outcomes in the light of strategic assessments of the conduct of others” (p. 956).

In the field of global education policy, Menashy and Manion (2016) have combined historical institutionalism with sociological institutionalism. In their approach, sociological institutionalism is defined as “an examination of the dynamics within organizations by studying bureaucratic rules and associated behaviors” (Menashy and Manion, 2016, p. 321). More specifically, sociological institutionalism:

Draws ... attention to the cultural norms within organizations that shape how the bureaucracy operates and responds to external pressures (Barkin, 2006; Schmidt, 2008). Under this approach, policy-making processes are argued to be governed primarily by formal rules and procedures, shaping which ideas are considered and selected and thereby what actions are taken by an organization (Campbell, 1998, 2002).

Menashy and Manion (2016, p. 321).

Interestingly, the approach taken by [Menashy and Manion \(2016\)](#) not only demonstrates the plurality of approaches to institutionalism, but also, in this case, shows that sociological institutionalism can be taken to have contrary meaning by different authors. Whereas [Menashy and Manion \(2016\)](#) assume that behavior in organizations is driven by formal rules and procedures, other authors have used sociological institutionalism as a synonym for WCT ([Hall and Taylor, 1996](#)), which, as already explained, sees organizational behavior as driven by rationalized myths and as characterized by a policy-practice disconnect. In any event, [Menashy and Manion \(2016\)](#) use their approach to historical and sociological institutionalism in order to inform their examination of how “the organizational structures of UNESCO and UNICEF influenced the ways in which each organization interprets their educational mandates” (p. 320).

Principal-agent theory

The principal-agent approach draws on field of economics to examine the relationship between international organizations (agents) and the states to which they are accountable (principals). This area of scholarship asks such questions as: why do states delegate certain responsibilities to international organizations and, once they do, how do states attempt to control them? Within this relationship, international organizations are conceptualized as semi-independent actors with significant leeway in terms of how they do what they do, that is, how they “implement policy decisions and pursue their own interests strategically” ([Hawkins et al., 2006](#), p. 5). Just as with the global governance perspective discussed above, scholars concerned with this dimension of the principal-agent approach ask questions about how international organizations take advantage of the room to maneuver that is afforded to them by their principals—and how principals respond in order exert control.

To be specific, principals are defined as actors that have the ability “both to grant authority and rescind it” ([Hawkins et al., 2006](#), p. 7), while agents are those who “receive conditional grants of authority from a principal” (p. 8). The semi-independent nature of international organizations is a function of discretion, that is, the fact that agents are created to accomplish certain goals (the goals of the principal[s]) but they have latitude in the actions taken to work toward those goals. In this respect, the principal-agent approach connects with WCT theory, in that discretion can lead to decoupling.

Despite the focus on discretion, agency tends to be conceptualized at the level of the organization, rather than at the level of the individual operating within them. In other words, studies tend to discuss entire organizations (e.g., UNICEF, the World Bank, etc.) as the agents who principals seek to regulate (see, e.g., chapters in [Hawkins et al., 2006](#)). This focus is distinct from that of the strategic-relational approach, discussed above, or that of institutional entrepreneurs, discussed in the next section.

The principal-agent approach has not been common in research in the field of education. Scholars in this field have more commonly sought to understand the politics of how policies get made within international organizations (e.g., [Verger et al., 2014](#)). Where a principal-agent lens has been brought to bear, it has been extended, as in the case of [Mundy and Verger \(2015\)](#), who, first, take into account not only the relationship between the World Bank and the states that serve as its formal principals, but also the relationship between this organization and the civil society organizations who put pressure on it and to whom the World Bank must respond in order to manage perceptions of legitimacy. Second, they look within the World Bank to see how its leadership and staff use the organizational slack available to them to act in autonomous ways, thus going beyond the unitary focus mentioned above. Third, these authors are attentive to the ways that the World Bank is responsive to the exigencies and expectations of borrowing countries, who must be willing to borrow if the World Bank is to survive.

Institutional entrepreneurship

Beyond [Jessop's \(2001a\)](#) strategic-relational approach, discussed above, there are two additional, and closely related, approaches that the focus on the ability of individuals within organizations to act as change agents. One is institutional entrepreneurship; the other is the idea of policy entrepreneurs, associated with the policy streams perspective.

When it comes to individual agency, the first perspective aligns with historical institutionalism ([Hay and Marsh, 1999](#)) and reacts to sociological institutionalism ([Menashy and Manion, 2016](#)) and WCT ([Meyer and Rowan, 1977](#)). This is so in that institutional entrepreneurship zeroes in on the “activities of actors who have an interest in particular institutional arrangements and who leverage resources to create new institutions or to transform existing ones” ([Maguire et al., 2004](#), p. 657). The project of institutional entrepreneurship has been to reintroduce “agency, interests and power into institutional analyses of organizations” ([Garud et al., 2007](#), p. 957). Here, and as with historical institutionalism, the focus on “institutional analyses” in the previous sentence is meant to draw attention to the ways that actors, through their entrepreneurship, contribute to “deviations from some norm” within organizations ([Garud et al., 2007](#), p. 960). More fully, “to qualify as institutional entrepreneurs, individuals must break with existing rules and practices associated with the dominant institutional logic(s) and institutionalize the alternative rules, practices or logics that they are championing” ([Garud et al., 2007](#), p. 962).

Interest in understanding how institutional entrepreneurs can succeed in institutionalizing changes has brought attention not only to the material resources available to individuals. It has also generated a focus on the “linguistic and symbolic aspects of power where the focus is on the meanings that humans attribute to a situation which, in turn, influences how they act in relation to it” ([Garud et al., 2007](#), p. 962). In this way, institutional entrepreneurship connects with some of the core tenets of CPE and certain strands of IPE and global governance scholarship. As one example of scholarship related to this area, [Verger \(2012\)](#) examines the strategies of entrepreneurs in the context of different international organizations as they frame and promote the idea of public-private partnerships as beneficial for education sectors in low- and middle-income countries. Ultimately, this research “reveals

the complex way in which programmatic ideas, political actors, institutions, and material factors interact to strategically put forward policy alternatives in developing countries" (Verger, 2012, p. 110). An additional example can be found in the work of Auld and Morris (2016), who likewise inquire into the strategies of entrepreneurs from different international organizations, albeit with a focus on how they use data from international achievement tests to "construct and promote knowledge of transferable 'best practices'" (p. 202).⁶

Policy streams and policy entrepreneurs

Notably, both of the examples discussed just above focus not on change within international organizations but rather how actors located in them advocate for policy change in other entities, such as ministries of education.⁷ This is distinct from the work of Sumida (2017), who draws on Kingdon's (1984) policy streams approach to conceptualize agenda-setting processes within international organizations. Here, the term policy entrepreneur, as opposed to institutional entrepreneur, is employed. While the notion of the policy entrepreneur mirrors that of the institutional entrepreneur, the former is conceptualized as situated within an explicitly political process within which different organizations participate and compete as they advocate for different policy outcomes. This is different from assuming, as is often the case, that institutional entrepreneurs operate in the context of a given organization as they dedicate themselves to effecting change there.⁸ However, as Sumida (2017) has shown, the policy streams approach of Kingdon can be adapted to study the evolution of policy change within an organization. But what, then, is the policy streams approach, and how can it be applied to an organizational context?

In short, Kingdon's (1984) approach has three different "streams," which, when they come together, open a policy window. The three streams are the problem stream, the politics stream, and the policy stream. The politics stream refers to the political context wherein different political parties, governmental representatives, and other organizations vie for position and influence. The problem stream, which can be affected by the politics stream, refers to which issues are defined as needing to be addressed—usually through governmental action, since Kingdon's (1984) approach was developed with the US government in mind. The policy stream, then, refers to the many ideas, proposals, programs, and solutions promoted by a variety of actors, including researchers, academics, and interest groups. A policy window is said to open temporarily when these three streams align. However, in order for a given policy response to be taken up and to move forward as *the* solution, it typically must be championed by one or multiple policy entrepreneurs, with these individuals defined as those who are "willing to spend their resources, such as time, energy, reputation, and money, to promote their position [(i.e., their solution)] in return for future gain" (Sumida, 2017, p. 383).

Although, as indicated, Kingdon's (1984) approach has tended to be employed in analyzing domestic politics, Sumida (2017) adapted it to the context of global governance. More specifically, she applied it to understand how the initiative known as the Decade of Education for Sustainable Development came to be taken up as a formal policy initiative of the United Nations during 2005–2014. To do so, she examined how certain policy entrepreneurs were not only able to sell this initiative to decisionmakers within the United Nations, but also how they were able to take advantage of the predictable policy windows that periodically open within this organization, and, in so doing, how they positioned this initiative as a response to the problems of environmental degradation and unsustainable development.

Organizational legitimacy

Literature on organizational legitimacy has tended to emanate from the field of business and examines, for example, how companies respond to crises such as oil spills or factory fires (see, e.g., Desai, 2011; Massey, 2001). Although international relations scholars have begun to discuss legitimacy in the context of international organizations, the literature has focused on legitimacy as a function of the democratic management of these organizations (see, e.g., Buchanan and Keohane, 2006; Zürn, 2004).⁹ Put differently, international relations scholars have looked for the source of legitimacy within such organizations. However, given the socio-political nature of the field of global education policy (Lingard et al., 2015), wherein international organizations collaborate and compete for influence, it is important to look outside of organizations, to the ways that they interact and perceive one another.

Drawing on the theoretical literature on organizational legitimacy, a framework for understanding organizational legitimacy in this field has been developed by Edwards et al. (2018) by drawing on literature from the fields of organizational management, sociology, and communications (e.g., Bitektine, 2011; Dowling and Pfeffer, 1975; Massey, 2001). Although scholarship on multilateral institutions has suggested that legitimacy results from a "generalized perception ... that the actions of an entity are desirable or

⁶Note that the literature on education has not tended to engage with the concept of institutional entrepreneurs, at least not when it comes to the global education policy field. This characterization is also true of Verger (2012) and Auld and Morris (2016), who both use the term policy entrepreneur. Despite this difference in terminology, they are included here as examples of institutional entrepreneurship precisely because of the lack of examples in the field of global education policy, and because of the conceptual similarity in the notions of institutional and policy entrepreneurs. The difference is in their area of application—inside versus across organizations—not in the substance of what they are thought to do.

⁷Attention to the examples just above still fits with the focus set out at the beginning of this entry because, in these cases, the work of international actors was to change others' policies.

⁸This way of approaching institutional entrepreneurs is more common outside of education.

⁹In this sense, UNESCO is among the most legitimate multilateral organizations, due to its democratic structure, where each member country has one vote.

Fig. 1 Components of organizational legitimacy. Source: Edwards et al. (2018).

appropriate" (Suchman, 1995, p. 574), the framework put forth goes beyond the notion of "generalized perception" and to delineate a conception of legitimacy based on three interrelated components—socio-political acceptability, reputation, and status. These components are depicted in Fig. 1. As can be seen, an organization can dedicate itself to achieving socio-political acceptability by (a) adapting to its context, (b) responding to changing expectations, and (c) invoking or affiliating itself with symbols (or other organizations) that possess legitimacy. The other two components—reputation and status—are beyond the organization's direct control.¹⁰

Reputation has a specific meaning. It is defined as (a) the "prestige accorded" to the organization "on the basis of how they have performed particular activities in the past" (Jensen and Roy, 2008, p. 497); (b) the organization's "relative success in fulfilling the expectations of multiple stakeholders" (Fombrun and Shanley, 1990, p. 235); and (c) the perception of the quality of the work of organization (Rhee and Haunschild, 2006, p. 101). Reputation is therefore the counterpart to an organization's striving. That is, while an organization may strive for legitimacy, changes to reputation depend on how those efforts are perceived by others.

Socio-political acceptability and reputation are then linked to status. Though there are no guarantees, an organization can dedicate itself to improving the perception of its performance, fulfilling the expectations of its stakeholders, and ensuring that its work is perceived as high quality—in hopes of raising its status among peer institutions, where status is defined as the "prominence of an actor's relative position within a population of actors" (Wejnert, 2002, p. 304), and where increased prominence is associated with increased "deference behavior" (Huberman et al., 2004, p. 103). Of course, as status is based on perception, it is socially constructed and depends on agreement among the relevant actors in a social system (Washington and Zajac, 2005). Thus, while it may be sensible for organizations to strive to improve their status, it should be noted that "legitimacy is not something that can be claimed by organizations, but is instead something that is given by stakeholders" (Massey, 2001, p. 156).

Something that should not be lost here is the relative nature of reputation and status. The former is based on "relative success" while the latter is connected with "relative position." The implication is that actors in the global education policy field do not only judge an organization against the expectations which have been placed on it (socio-political acceptability), but also judge the performance of this organization in comparison to its peers (reputation), with that valuation affecting its overall position in the field (status).

Edwards et al. (2018) apply this framework to UNESCO. Having faced a crisis of legitimacy for decades, UNESCO sought, starting in the 1990s and early 2000s, to use both its coordination of the Education For All initiative and the production of its Global Education Monitoring Report to raise its status in the field of global education policy. The study by Edwards et al. (2018) provides insights into the successes and challenges faced by UNESCO in this effort. In using this framework, the authors were able to show how, due to UNESCO's efforts, this organization was able to raise its reputation by responding to the changing socio-political context, though it still could not elevate its status to match other organizations, such as the World Bank, which continued to pursue its own initiatives that helped to maintain its dominant position in the global education policy field.

¹⁰While they are sub-components of legitimacy in this framework, status and reputation have their own literatures. See Washington and Zajac (2005) for their excellent review of the theory on status and Fombrun and Stanley (1990) for their treatment of the literature on reputation. Bitektine (2011) provides a very thorough review of different definitions of legitimacy as well as the relationships among legitimacy, status, and reputation.

Science and technology studies

Research from the STS approach does not conceptualize directly the work of organizations. It is an area of inquiry that looks at the “sociology of knowledge processes” from a particular perspective (Gorur et al., 2019, p. 7). In drawing on Camic et al. (2011, p. 6), Gorur et al. (2019) emphasize that STS is concerned with “the day-to-day actions and processes through which the producers of social knowledge actually go about the on-the-ground work of making, evaluating, and disseminating the kinds of social knowledge that they are involved in producing” (p. 7). Of course, these processes do tend to play out within organizational contexts. However, rather than apply a ready-made theory of organizational behavior that separates structure from agency, the STS tradition looks at how assemblages of human and non-human elements are formed as they come into contact with one another (Latour, 2005). The idea is that these assemblages function as temporary structures that are co-constituted by the operation and intersection of human and non-human agency. In this way, STS encourages an approach to power that is “both relational and dynamic, rather than structural and monolithic” (Gorur et al., 2019, p. 4).

The avoidance of a priori theory means that STS depart from the perspectives of those who are embedded in the contexts and processes—or assemblages—of interest. One must explain phenomena from their perspective, rather than imposing conceptual categories or frameworks. In this respect, one can see how STS connects with approaches to global governance that are rooted in constructivism. A key difference, as noted above, is the focus on non-human agency. The core insight here is that “politics and power relations are distributed through ‘things’—materials and technologies, numbers and standards—things that often are underestimated or overlooked as agents in educational research” (Gorur et al., 2019, p. 4; Latour, 2005). The value of such an approach is intuitive when one considers that humans are constantly interacting with and, indeed, reacting to material and discursive elements as they go about their business (Koyama and Varenne, 2012).

Importantly, one goal of research thus oriented is to understand how temporary constellations of actors and objects allow for common understanding to develop and take hold among actors in a network. Drawing again on Gorur et al. (2019), STS scholars STS research, then, attempts to shed light on how categories for understanding come to be.

explore the mundane and everyday practices through which, eventually, ideas and fact-making are stabilized and systems are established. They attempt to open up the black boxes of the taken-for-granted and of common sense to reclaim the tentativeness and contingency by tracing their routes to naturalization.

(p. 4; see also Savage, 2019).

In the field of global education policy, the STS approach has historically received scant attention, though this is changing, as the special issue edited by Gorur et al. (2019) indicates. That said, there are still few studies that look explicitly at—or that connect with—the work of international organizations. Among the few exceptions, perhaps the most relevant to mention is the study by Addey and Gorur (2020), entitled “translating PISA, translating the world.” These authors drawn on the STS approach to argue that the adaptation of the OECD’s PISA test to low- and middle-income country contexts was not only a technical exercise but was also a political one, with both being necessary in order for country participation to make sense, and in order for the PISA results of these countries to be interpretable, that is, to have agreed upon meanings shared by those who come into contact with them.

A way forward: circuits of power

Each of the previously discussed perspectives brings a distinct approach to the issue of organizational work. While each perspective has its strength, we argue here that the approach of Clegg (1989), elaborated in his book, *Frameworks of power*, brings together and extends the benefits of these other approaches. However, before discussing further the ways that Clegg’s (1989) approach can be seen as an improvement, we first turn to explaining his approach.

In essence, there are two dimensions that work together. One is labeled the “sociology of translation,” while the other is “circuits of power.” The former is temporal in nature and has to do with the phases of activity that characterize (policy) change within an organization. The latter—circuits of power—must be taken into account during each phase, for its components affect the ability of change to take place over time. The combination of these two approaches enables one to engage in an analysis of policy change—or, really, any kind of substantive change that is made in terms of how things are done—within an organizational setting that considers such factors as individual and non-human agency, social relations, and organizational structures, as well as factors exogenous to the organization, among others.

With the above in mind, we note that Clegg (1989) understands organizations as a “locus of decision and action” (p. 197). The question becomes, within this understanding of organizations, how international organizations—but particularly those engaged in policy work—come to support certain reforms and not others. In other words, the analytic puzzle has to do with explaining the decisions and actions that lead to organizational change.

According to the approach of the “sociology of translation,” organizational change happens through four moments. In the first—problematisation—agents of an organization posit “the indispensability of their solutions for (their definition of) the others’ problems” (Clegg 1989, p. 204). For the second—*intéressement*—agents engage in “the process of ‘interesting’ or ‘enrolling’ another agent to one’s own agency” (p. 205). It is important to highlight that, here, the agent seeks to “lock in” what is meant or, we suggest,

Fig. 2 Organizational Circuits of power. Source: Edwards and Moschetti (2021), adapted from Clegg et al. (2006).

envisioned by the policy being advanced. The third moment—enrollment—then endeavors to transform the interest of other agents into “alliances and coalitions” (p. 205) around shared meanings. Conceptually, moments two and three are distinct, though they may difficult to separate empirically, since a given action can seek both to generate interest in a policy and to create a coalition—that may be more or less formal—to support it. The last moment is mobilization; it refers to “the set of methods that agencies [(i.e., actions, not ‘international agencies’)] use to ensure that the representations of interest ... are in fact themselves fixed” (p. 205). Put differently, mobilization is simply the actions (or “agencies” in Clegg’s (1989) terminology) executed by an organization and its agents for the purpose of ensuring that the policy or reform of interest is defined and understood in a certain way.

Thus, overall, the sociology of translation describes a rather straight-forward political process, and one that has echoes of other approaches, such as Kingdon’s (1984) policy streams framework. However, Clegg’s (1989) approach has the benefit, first, that it focuses explicitly on the *internal* dynamics of organizations (as opposed to being concerned with more general political systems and policy arenas) and, second, that brings a particular approach to conceptualizing individual agency. We turn to this latter issue next.

Clegg (1989) offers a way of understanding agency that is usefully nuanced. For Clegg (1989), organizational change is not explained by the internalization of institutional “myths” (as in WCT) or by relations of economic dependence (as with certain IPE strands and neo-Marxist international relations). Rather, organizational change is the result of the way that “episodic agency” operates in a matrix of “social relations” and “standing conditions,” with these dynamics then dialectically intersecting with two circuits of power—namely, the “circuit of social integration” and the “circuit of system integration” (see Fig. 1). To be clear, episodic agency is the term used by Clegg (1989) to refer to autonomous actors’ free-thinking, whereas standing conditions refer to resources and the means to which actors have access for the purpose of advancing their preferred outcomes. The circuit of social integration, for its part, is “concerned with fixing or refixing relations of meaning” (p. 224), while the circuit of system integration is focused on changes to strategies for discipline and production. Here, “production” can be understood as the daily business of the organization in question. Furthermore, as agents engage in actions to create shared understandings and to gain approval for new ways of doing things, these new meanings and techniques of production (or discipline) must successfully pass through required points of organizational regulation or approval, labeled by Clegg (1989) as “obligatory passage points.” Once these new meanings and practices are approved, they shift the social relations and standing conditions within which actors maneuver. Finally, as Fig. 2 depicts, the impetus for pursuing organizational change can result from factors that are both endogenous (i.e., coming from within an organization) and exogenous (i.e., stemming from external pressures and opportunities).

It may be helpful to restate the language of this framework such that what it envisions is easily grasped. There are four key points. First, individuals—in our case, organizationally-positioned policy entrepreneurs—act within a network of relations that are not only social (i.e., human) and non-human¹¹ but also based on their position vis-à-vis standing conditions (i.e., based on the extent to which they can access and can utilize resources). Second, these actions seek to produce certain kinds of intermediate outcomes (understood as actions or milestones) that contribute to a transformation of the existing “relations of meaning” (i.e., which policies are seen as desirable) and the “techniques of production” (i.e., how the organization does what it does; in the case of the World

¹¹We note that Clegg’s (1989) framework connects with STS in that it accommodates non-human activity as a form of agency. Clegg (1989) was clearly attuned to this form of agency, as when he wrote that “one has to withstand any ontological impulse to restrict the category of agency only to human beings” (p. 187), or, as an additional example, that “not all agents are human actors. Agency must be vested in non-human entities as diverse as machines, germs, animals and natural disasters” (p. 188).

Bank, for example, this can mean the reforms and models that it funds and attempts to implement through its loans and technical assistance). Third, for these transformations to occur, the proposed change has to successfully move through “obligatory passage points,” that is, mechanisms of control within the organization that are defined by the rules of how the organization operates. These passage points are often individuals in positions of authority who serve as what we would call “guarantors of the status quo.” Taking the World Bank again as an example, this could mean the loan approval process, with all its safeguards and legal requirements. Finally, if these transformations succeed, they will alter, in a dialectic fashion, the network of social relations within which an actor operates as well as their position within the organizational standing conditions. This makes sense: As an actor contributes to (positively perceived) change within an organization, their social standing in that organization will naturally rise.

Because organizational agents are constrained by their human/non-human relations and standing conditions, not to mention the circuits of social and system integration as well as obligatory passage points, they are not free to pursue any change they may wish. That is, they cannot freely pursue any desired change. As Clegg (1989) writes, “the interests of actors in organizations and the decisions that they make are necessarily contingent on various forms of organizational calculation” (p. 197). It may be the case that certain agents in international organizations have “high discretionary strategic agency” (p. 199)—and that such discretion, as principal-agent theory suggests, may be “organizationally creative, productive, [or] reproductive” (p. 200)—yet it is also true that “power will always be inscribed within contextual ‘rules of the game’” and that “these rules may be taken to be the underlying rationale of those calculations which agencies routinely make in organizational contexts” (200). In other words, the “interests” upon which agents act are informed by the representations (i.e., “discourse”) they encounter of what is important to the organization, with these representations, of course, being in part a consequence of the structural characteristics of the organization in which one is embedded. The implication is that this approach is not concerned with the “true interests” of organizational agents, but rather only in the actions they take to work toward certain outcomes within the relevant structures of opportunity (e.g., career advancement) and discipline (e.g., dismissal).

In combining the sociology of translation with the circuits of organizational power approach, the task for scholars is to explain how organizational agents move through the four moments of translation while navigating the dimensions of the circuits of power framework. An example is provided by Edwards and Moschetti (2021), who examine policy change inside the World Bank. They look at how advocates within the World Bank fought for the acceptance of the policy of community-based management of education. More specifically, they look at how this policy was adapted from the context of El Salvador, promoted within the World Bank, and then finally fully embraced as one of this organization’s flagship policies during the 1990s and 2000s.

Conclusions: strengths and possibilities

The previous section began by asserting that Clegg’s (1989) approach brings together and extends the strengths of other approaches. We return to that point here. As the discussion above has shown, the circuits of power approach:

- (a) Accommodates the dissemination of values and discourse (as in WCT) but without sacrificing strategic individual agency (as promoted by the strategic-relational approach, institutional entrepreneurs, and the policy streams approach);
- (b) Takes the discretion of the principal-agent approach but opens it up to avoid the assumption of unitary organizational actors (similar to the global governance approach but with much more theoretical specificity when it comes to understanding organizational dynamics);
- (c) Reflects the key tenet of STS that non-human agency must also be taken into account, but without the need to relinquish a focus on intentionality and actors’ interests, and also without the need to eschew a general, guiding theory of organizational change dynamics;
- (d) Maintains emphasis on structures, for example, those larger (or exogenous) structures within which the organization is based (as with IPE, CPE, and Kingdon’s (1984) politics stream) but also those structures internal (or endogenous) to the organization (as with the strategic-relational approach and institutional entrepreneurship literature)—though without assuming that either individual or organizational behavior is entirely determined by them;
- (e) Is able to explain change to internal organizational structures (as with historical institutionalism) but with more analytic guidance (beyond claiming attention to organizational context and the role of ideas or beliefs);
- (f) Draws attention to “bureaucratic rules and associated behaviors” within organizations (as in the case of sociological institutionalism; Menashy and Manion, 2016, p. 321) but reframes the rules-social relations intersection as mediated and influenced by additional factors; and
- (g) Attends to contextual pressures related to organizational legitimacy but usefully combines attention to this with a nuanced notion of what propels and constraints behavior inside the organization, as individuals react to external pressures.

With the above in mind, we conclude by returning to the goals set out at the beginning. Ultimately, in providing this overview of different approaches, this entry has sought, first, to make clear the options available for guiding research on international organizations, second, to emphasize an approach that is seen as particularly insightful, and, third, to encourage more explicit and theoretically-informed discussions of the nature of international organizations. This last goal is, we suggest, important given the centrality of international organizations and their networks to the field of education generally and global education policy specifically.

On this last point, about networks, it should be stated that Clegg's (1989) approach—and the broader discussion offered here—can indeed be extended further. Although Clegg (1989) has advantages over other approaches, his framework, too, can, and should, be further developed by bringing it into conversation with networks. His focus in this area is perhaps underdeveloped because his emphasis was on what happens *inside* organizations. On the other hand, Clegg (1989) might respond that his attention to “social relations” captures or subsumes a focus on networks. In any event, while there is not a substantive focus on this issue in Clegg's (1989) approach, networks and the phenomenon of network governance have garnered significant attention since the publication of his book (Ball, 2012; Edwards et al., 2021b; Olmedo, 2017). Thus, one promising area for future work—among others, such as bringing more critical attention to how his framework accommodates, or doesn't, a focus on culture within organizations (Anderson-Levitt, 2012)—would be to flesh out how these two areas of scholarship complement one another.

Introduction

The influence of the World Bank in shaping global education policies can hardly be disputed. Backed by the rationale of human capital theory, the quantitative and qualitative expansion of the World Bank's educational activities allowed this supranational organization to hold for many years a quasi-monopoly in the area of international aid for educational development. Interestingly enough, an institution that never had an explicit education mandate among its goals became the most prominent actor in the field of educational development. Changes in the economic world order, shifts in educational multilateralism and internal crises in institutions such as UNESCO resulted in the dominance of institutions such as the IMF or the World Bank in shaping the international agenda for development, in particular after the financial crisis of the early 1980s (Mundy, 1999). Even if the World Bank's influence appears to be dwindling and the organization is the object of mounting criticism, its power and ascendancy within the global education field remain unmatched.

For almost 60 years, the Bank¹ has exhibited the financial and technical capacity to become a prominent actor in education and development. However, its role has changed over time, from a more prescriptive and strict imposition of specific policies to a more versatile and flexible institution with a higher disposition to adapt to the needs of the borrowing countries. The debate about the nature of this change is open. A critical controversy is whether the organization has abandoned a neoliberal paradigm of development or has never done so, introducing only apparent or superficial changes that keep its ideology unaltered.

Nonetheless, and beyond this debate, there are visible changes in the policy orientation and programmatic priorities of the strategic sectoral papers that the Bank has produced in the last decades. The fluctuations in the World Bank's strategies have to be understood in a context of a changing landscape of multilateral aid. The legitimacy crisis of the Bank's neoliberal agenda, new international actors gaining higher presence in the field of international education or the globalization of targets and priorities in the field of economic and social development may explain why the Bank has shifted its priorities and strategies in education.

This chapter explores three main phases of the World Bank approach to education. The first one refers to the irruption and consolidation of the organization as a key actor in educational aid, especially through mechanisms of loan conditionality during the 1980s. A second period starts with the crisis of Structural Adjustment Programs (SAPs) and the opening of the Bank toward the Post-Washington Consensus in the 1990s. A change toward a less prescriptive and more comprehensive role was effected during the James Wolfensohn's mandate and the launch of the Poverty Reduction Strategy Papers. Finally, the third phase refers to the aftermath of the 2008 crisis and the importance given to learning in the international scene of educational development. New global agendas for education, new actors and changes within the organization that changed the balance of power explain a higher level of heterodoxy of the World Bank education policy, particularly visible in the 2018 World Development Report.

Although the three periods identified are not homogeneous in length, each one captures important shifts in the priorities and strategies in education set by the Bank. For each period, we describe the key features of the WB strategy and identify the main factors to understand its priorities and the reasons for the policy shifts. A final section concludes and reflects on the future directions that the organization may take in the current global scenario of the Sustainable Development Goals (SDGs).

The emergence of the WB as a prominent actor in education for economic development

Education as a capital investment sector was not part of the World Bank portfolio when the Bank was first established in 1944. Nevertheless, the formulation of Human Capital Theory by Theodore Schultz and Gary Becker in 1960 justified and opened the

¹The terms *the World Bank*, *the Bank* and *the WB* are used interchangeably in this entry.

door to the possibility of lending to education. Key works on the economic value of education gave a rationale for understanding the contribution of education to economic growth and valuing the concept of human capital (Becker, 1974; Psacharopoulos and Woodhall, 1985). In 1960 the International Development Association (IDA) was founded as a Bank affiliate to promote economic and social progress in the poorest countries. Education was considered a key sector for social progress and the improvement of living standards. For the WB, education was mainly understood as a key sector for social and economic development. From this perspective, investing in education became strategic for governments, since education was supposed provided returns to investment at both social and private levels.

The first WB education project was launched in 1962. Since then, the field of educational development cannot be understood without examining the role of this international organization. Despite education not being the most prominent sector of the Bank's capital investment, lending in education has accounted for proportions between 5% and 9% of the Bank's portfolio (Mundy and Verger, 2015). The arrival of Robert McNamara to the WB presidency in 1968 reinforced the role of the Bank as a social policy entrepreneur, and focused its role on the objective of poverty reduction and the satisfaction of basic needs. As Stephen Heyneman argues, by the end of the 1960s and during the 1970s, investment in education was seen as a key aspect for ensuring the necessary technical capacities for development (Heyneman, 2003). The focus on agriculture, industry and manufacturing increased the importance of recurrent expenditures -unlike the exclusive concentration on capital investment that characterized the first years of the World Bank- and put capacity building as one of the main goals for social development. Human capital needs were assessed through manpower planning forecast systems, which provided the rationales for lending in education.

However, and unquestionably, it was during the 1980s that the WB consolidated its position as the most influential and powerful agency in the area of educational development. The difficulties of many developing countries in facing their external debt in the context of an enormous increase in interest rates induced a change in the lending system of the Bretton Woods institutions. Their hegemonic position within the international market of financial assistance for development and the extreme dependency of highly indebted countries on international loans, mostly to refund external debt interests, completely shifted the relationship between the Bretton Woods institutions and borrowing countries. Both the IMF and the WB established a new system of loan conditionality based on the implementation of specific macroeconomic measures and institutional reforms. Loan conditionality thus allowed for the so-called Washington Consensus to become a blueprint for economic development. Through programs like Structural Adjustment Facilities, Extended Fund Facilities or Structural Adjustment Loans, both the IMF and the WB were able to impose the neoliberal paradigm of development to borrowing countries, regardless of the previous social and economic conditions. Countries receiving assistance needed to signal a strong commitment to fiscal adjustment, tax reforms, deregulation, trade liberalization, attraction of foreign investment and privatization in their plans in order to continue to have access to international funding (Cornia et al., 1997).

The translation of this loan conditionality in education was named by Stephen Heyneman as the "short education policy menu", visible in the 1980 *Education sector policy paper* (World Bank, 1980). Emerging from the rate of return analysis (Bennell, 1996), education policies were supposed "(i) to shift public expenditures away from vocational and higher education toward academic and basic education; (ii) to increase the private cost for attending universities; and (iii) to install loan schemes to set off the financial burden on individuals who now must face high tuition fees for higher education" (Heyneman, 2003, p. 325). In addition, the short education policy menu included cost-recovery strategies (including fees in basic education) and decentralization strategies to improve the efficiency of education systems. Interestingly, the priority for basic education bolstered the credibility of the Bank because it relied on apparently irrefutable arguments legitimated by the dominant paradigm of economics of education. It also allowed the Bank to appear as an institution concerned with the struggle against poverty and the expansion of educational opportunities. At the same time, the rates-of-return rationale legitimated other arguments favoring more user participation in the financing of post-basic education and the increase of the private sector in educational supply.

Structural adjustment programs and the adoption of the short education policy menu entailed a change in the political rationality of recipient countries (Morrow and Torres, 2000). Their higher dependency on multilateral funding changed the priorities and strategies for education and limited the number of options available. In this way, the new lending system did not only reduce national autonomy to set educational strategies, but significantly restricted the available policy options. Recipient countries were aware that they had to adopt the recommended policies to keep receiving funding from the WB.

A number of studies about the impact of SAPs on education (Reimers and Tiburcio, 1993; Carnoy and Torres, 1994) evidenced several negative effects on education indicators, such as the fall in educational expenditure as a percentage of the GDP, the reduction of per capita education expenditure, the increase in educational absenteeism and school failure or a contraction in access to primary and secondary education (Bonai, 2002). It is not clear whether these negative effects were the result of the direct effects of the short education policy menu or whether they were rather caused by the indirect effects of severe macro-economic adjustment measures dictated by international financial institutions, with clear implications on educational budgets (Dale, 1999). The rise of opportunity costs of educational investment for the poor (traditionally undermined by the World Bank estimations), the need to plan long-term investments to overcome poverty, the higher costs of education linked to cuts in public budgets and increasing privatization, or the opting-out of the middle classes from less protected and low-quality public services all are factors that can explain why SAPs had significant negative effects on public education in most developing countries.

Paradoxically, the failure of neoliberal policies in education did not induce immediate changes in the WB agenda. The creation of the World Bank's Development Economics Vice-Presidency played a key role in the "art of the paradigm maintenance" (Wade, 1996). The research department of this vice presidency played a critical role in legitimizing the neoliberal "free-trade"

paradigm for more than two decades. By means of hiring “adequate professionals,” creating incentives for internal promotion, discouraging dissonant discourses, selecting the presentation of data or projecting “rigorous and sound” research, the Bank reinforced its image as a knowledge Bank within the paradigm of neoliberal economics (Broad, 2007).

Nevertheless, and despite this art of paradigm maintenance, the reverse effects of SAPs on poverty explain the progressive abandonment of the strict neoliberal orthodoxy and the subsequent adoption of a development agenda that includes strategies complementary to a market-led model of economic growth. Thus, in the late 1980s, the Washington Consensus was experiencing difficulties in the face of a number of criticisms. The rise of poverty and subsequent complaints about structural adjustment effects led to demands for an adjustment with a human face (Ilon, 1996). Simultaneously, the success of East Asian economies opened claims for a different role of the State in development (Fine, 2001), which challenged the neoliberal assumptions of the Washington Consensus and claimed for context-based national strategies of industrialization to ensure the integration into the global economy (Gore, 2000).

Against such background, the Bank’s decision to join the 1990 World Conference on Education for All (WCEFA) celebrated in Jomtien can be mainly understood as an attempt to regain some of the organization’s lost legitimacy. Unlike UNICEF or UNESCO, the World Bank was more of a late and hesitant sponsor of the WCEFA (Chabbott, 2003). Nonetheless, the conference eventually came to be perceived within the WB’s education circles as an opportunity to regain a position of political leadership against a much-debilitated UNESCO, and to persuade other education agencies that the WB policy prescriptions were in line with the new education agenda then in the making (Jones, 2007a). However, efforts at the restitution of the World Bank’s credibility were not confined to the education sector—they also took place at an organizational level. As we will see in the next section, the opening of a debate about development that would eventually create the conditions for a Post-Washington Consensus owes much to the work of Joseph Stiglitz as Chief Economist, and to the changes introduced during the presidency of James Wolfensohn in the 1990s.

The World Bank and the Post-Washington Consensus

In the light of the mounting evidence on the negative impact of SAPs in education, by the mid-1990s, the “short education policy menu” started to show signs of exhaustion—outside but also within the WB education circles. While the commitment to the WCEFA allowed the Bank to regain a sense of alignment with the global education community, it could not entirely neutralize the internal and external legitimacy damage suffered by the organization. The publication of the *Strategies and Priorities for Education* policy document² in 1995 (World Bank, 1995) was a critical episode that laid bare the growing levels of internal dissent and the appetite for a change in the World Bank’s policy approach. Thus, the strategic document was prepared amid a climate of tension that pitted regional managers and operational staff against the Bank’s education staff based in the headquarters. According to Heyneman (2003), regional staff feared that the emphasis on the short policy menu would put at risk their relationship with borrowers. Their demands for a less orthodox approach were, however, largely ignored by the team in charge of drafting the new policy document. Thus, and quite predictably, the publication of the 1995 paper faced a considerable backlash within education policy circles internal and external to the Bank. The emphasis on the decentralization and privatization policies and the ratification of the short education policy menu did not bode well with the expansionist and aspirational spirit of the Education for All (EFA) agenda (Jones and Coleman, 2005), and the paper became the object of a number of replies and critical pieces (e.g., Lauglo, 1996; Samoff, 1996).

The poor reception of the 1995 paper gave rise to a period of soul-searching that would ultimately result in a reconfiguration of the World Bank’s discourse on education policy. As Jones and Coleman (2005) affirm, “much subsequent bank thinking and pronouncing about education [*post 1995*] needs to be seen partly as an attempt to project a softer, more inclusive and less strident view of education and its benefits” (p. 122). Thus, over the years to come, the World Bank education sector launched different initiatives oriented at appeasing its internal and external critics. However, and as discussed below, these changes left largely untouched some fundamentals of the short policy menu.

This relative appetite for institutional change within the Bank’s education sector needs to be understood in relation to broader changes affecting the organization. Thus, by the mid-1990s, the World Bank was close to a crisis of legitimacy. Different civil society campaigns had put the Bank under the spotlight, drawing attention to the regressive effects of SAPs (Vet-terlein, 2007). Prominent figures within the World Bank were also emphatic about the need for structural change—most notably, Joseph Stiglitz, appointed Chief Economist in 1997, and who would become a vocal critic of the Washington Consensus orthodoxy and market fundamentalism (cf. Stiglitz, 1998, 2003). In addition, the World Bank’s centrality as a development partner was being eclipsed by the emergence and consolidation of other development partners, including the Inter-American Development Bank and the Asian Development Bank. The market share of the WB was thus dwindling, and the Bank’s dogmatic approach proved increasingly problematic in responding to the demands of an increasingly heterogeneous pool of borrowers (Mundy and Verger, 2015).

²Note that although the paper was formally devised as a policy review, it had a distinctly prescriptive nature.

Thus, under the presidency of James Wolfensohn (1995–2005), the World Bank embarked on a process to boost its own credibility and reputation. Wolfensohn announced a revitalization of the Bank's focus on poverty alleviation as well as a willingness for the Bank to become more "client-centered"—which meant more responsive to the demands of its borrowers (Mundy and Verger, 2015; Mundy, 2002). Also, and as noted in the prior section, the Bank started to transition toward the so-called Post-Washington Consensus (Pereira, 2016; Gore, 2000). According to Fine (2001), the Post-Washington Consensus approach is openly critical of the Washington Consensus but rejects the State versus markets dualism. In this sense, and as observed by Mundy (2002), the new approach should not be understood as a radical departure from the belief in the power of the market or open trade, but rather as "an effort to understand the failures of various assumptions and expectations within the Washington Consensus package, based on the idea that package should be seen as a flexible set of policy options" (p. 496).

As part of Wolfensohn's attempts at institutional transformation, Poverty Reduction Strategy Papers (PRSPs) were promoted as a replacement for structural adjustment lending. PRSPs were national planning frameworks required for countries wishing to qualify for external assistance or debt relief. They combined elements from the Washington Consensus with a greater concern for human and social development and governance issues, thus bringing poverty-alleviation concerns into sharper focus and being one of the clearest manifestations of the Post-Washington Consensus (Mundy, 2006; Tarabini and Jacovkis, 2012). Another central component of Wolfensohn's new vision was the Comprehensive Development Framework (CDF), which promoted a multidimensional approach to development. The rise of the CDF entailed a crucial procedural change, for it required the inclusion of (or a dialogue with) the civil society organizations, NGOs and beneficiaries of the World Bank's projects in the very design of such interventions—as a means to guarantee greater country ownership and context-sensitivity (Jones, 2007a; Bonal and Tarabini, 2009).

However, and as noted by different authors, the combination of PRSPs and CDF did not clearly translate into a change in the WB's operational practices and policy approach. In the area of education, Klees (2002) noted that, in practice, many PRSPs showed little adherence to the principles of participation and continued to pay limited attention to social protection policies. It was thus soon apparent that the PRSP and the PWC did not entail a radical departure from the neoliberal principles that had long dominated much of the WB's activity. As noted by Bonal (2002), by the early 2000s, it was far from clear that the PWC had succeeded in truly altering the principles underpinning the Bank's education policy. The author thus observed that "basic features of WB education policy, like the rates of return rationale for educational investments, the importance of private education, and the marginalization of vocational education and training remain unaltered" (p. 13).

In fact, the 1995–2000 period can be characterized as one of internal inconsistency in which the gulf between the WB's policy positions and lending practices grew considerably (Jones, 2007a). On the one hand, the education sector continued to advance a neoliberal agenda and simply tweaked its language in response to the rhetoric of responsiveness and flexibility promoted by the WB leadership. On the other hand, regional managers and operational staff continued to ignore the centrally-formulated policy designs as a means to avoid alienating their borrowers.

Importantly, this is a period in which the WB's dominant position in the education for development area (both as a donor and as an agenda-setter) suffered a rapid decline. Particularly during the late 1990s, the quality of the World Bank's analytic work decayed (Jones, 2007a). This progressive weakening of the WB's technical capacity in education cannot be dissociated from the staff shortages that affected the educational sector during the late 1990s because of organizational reforms and budget cuts (Mundy, 2002). In parallel, education lending activity slowed down because of the combination of the World Bank's inflexibility regarding priority areas and lending instruments, and increased competition on the part of multilateral development partners (Jones and Coleman, 2005).

Matters were compounded by the fact that the publication of a new *Education Sector Strategy* in 1999 only succeeded partially in giving the World Bank's education sector a sense of direction. Thus, while the 1999 strategy signaled the abandonment of the short education policy menu and continued to put a premium on flexibility and diversity as *procedural* values, no new policy priorities were clearly identified, thus giving way to something of a "policy vacuum" (Mundy, 2002; Heyneman, 2003). On the plus side, this policy vacuum and the collapse of the short education policy menu allowed for greater heterogeneity in terms of policy responses and policy research—as noted by Jones and Coleman (2005), this is a period in which the range of research questions was significantly expanded.

The early 2000s were characterized by a certain return to the coordination between operational and policy work, while leading to a greater definition of the World Bank's education policy agenda (Jones, 2007a). Between 2000 and 2005, the WB defined new positions in a number of key areas, including higher education and the private financing of education. Thus, the Bank became an explicit supporter of the abolition of school fees in primary education (Mundy and Menashy, 2014) and recognized the need for greater public spending on higher education after years of ambivalence—a shift justified by the centrality of university education in the context of the knowledge economy (Mundy and Verger, 2015), patent in the higher rates of return of tertiary education (Verger and Bonal, 2012). The new position was summarized in the *Education Sector Strategy Update: Achieving Education for All, Broadening our Perspective, Maximizing our Effectiveness*, framed as an update of the 1999 Education Sector Strategy (World Bank, 2005). Remarkably, much of the new position embraced by the new strategy followed the approach already favored by the regional division and lending operations.

One of the most distinctive features of the new strategy was the relative loss of centrality of the rates of return analysis (Verger and Bonal, 2012). The document thus marked the abandonment of the obligation for borrowers to prioritize certain education levels and the advance to a more expansive and flexible approach to education spending. While this represented a clear departure from the prescriptive approach that had prevailed in the past, the new strategy also featured elements of continuity—most notably, the

insistence on a narrow set of policy options closely connected to the neoliberal agenda and the dominance of neoclassic economic orthodoxies, such as privatization and decentralization (Mundy and Verger, 2015). Indeed, the principles of choice and competition only acquired greater prominence during the mid-2000s.

The World Bank after 2008: building a partial heterodoxy

In the aftermath of the 2008 financial global crisis, the World Bank experienced important transformations that influenced its discourse and strategical approach to the education sector. According to Mundy and Verger (2015), two main geopolitical and political factors have affected the Bank in this most recent period. First, the increasing role of emerging economies, such as China, India and Brazil, as development actors and donors. These countries recently moved from being borrowers of the World Bank to influential international donors, particularly among low-income countries in Africa. The increasing relevance acquired by these countries in the international arena coincided with a period in which the historically influential members of the World Bank were still struggling with the consequences of the global economic crisis (i.e., low growth rates and increasing national debt). The second factor that has influenced this period was the presidency of Jim Yong Kim, who promoted a new institutional strategy (see World Bank, 2013) and internal organizational reform. Kim reinforced the “knowledge turn” (Zapp, 2017) embraced by the Bank in the mid-1990s, promoted the role of the Bank in the dissemination of best practices, and undertook a significant internal organization restructuring to better respond to this role.

Regarding the World Bank approach to the education sector, the most relevant policy document of this period is the *Education Strategy 2020* (ES2020), released in 2011 (World Bank, 2011). As different authors have pointed out, while this new strategy involved discursive changes in relation to the previous strategical documents, the policy proposals continued to be aligned with the most traditional paradigms of the World Bank (Verger and Bonal, 2012; De Siqueira, 2012). According to Edwards and Storen (2017), most of the policy ideas advanced by the ES2020, such as standardization, national learning assessments or accountability mechanisms, have been promoted by the Bank since the 1990s.

Despite the continuity in terms of policy options promoted by the World Bank, the ES2020 contained some relevant discursive transformations, one of the most relevant being the focus and centrality of learning. Although the World Bank recognized that significant achievements had been made in the past two decades in expanding access to education, the new strategic document considered that the main challenge faced by national governments, particularly in low and middle-income countries, was ensuring “learning for all.” In this way, the Bank recognized that access to education was not enough to ensure that students would learn at school, and highlighted the need to ensure students maximize the level of learning achieved during schooling. Based on the revised human capital approaches to the relationship between education and economic growth (see, for instance, Hanushek and Woessmann, 2007), the new emphasis on learning over access was justified by the World Bank because “growth, development, and poverty reduction depend on the knowledge and skills that people acquire, not the number of years that they sit in a classroom” (World Bank, 2011, p. 3). For the World Bank, the focus on learning as the main objective of education policies required to overcome the input-driven reforms and promote policy options to set the necessary incentives to boost learning. However, as Verger and Bonal (2012) point out, despite the emphasis on market solutions and demand-side interventions, the new strategy is ambiguous regarding the specific policy options that promote learning.

In line with the 2013 World Bank Group strategy, the ES2020 also entailed a significant change in the role that the World Bank was supposed to play in the definition of education policies. The new strategy emphasized and reinforced the role of the Bank as a provider of knowledge and technical expertise rather than as a prescriber of specific policy options (Verger and Bonal, 2012). According to this, one of the main initiatives included in the ES2020 was the Systems Approach for Better Education Results (SABER), which became an evolved and upgraded version of the previous Education Knowledge Management System (EKMS) program included in the 1999 Education Strategy. This new World Bank’s project, launched in 2011, had as its main objective “to collect and disseminate comparative data and knowledge on education policies, to help countries systematically evaluate and strengthen their education systems” (Rogers and Demas, 2013, p. 10). This knowledge initiative covers so far 13 different domains, from early childhood education to tertiary education. According to authors such as Zapp (2017) or De Siqueira (2012), SABER pretended to reinforce the “knowledge turn” of the Bank, becoming both a diagnostic and benchmark tool for policies and educational institutions.

Another relevant characteristic of the new education strategy is the renewed emphasis on non-state actors and market solutions. Although the World Bank has been a historical advocate and active promoter of the involvement of private actors and market mechanisms in the education sector, the ES2020 can be considered a step forward in this regard (Mundy and Menashy, 2014; Verger and Bonal, 2012). In contrast with the initial approach to non-state actors’ involvement developed during the 1990s, in which private provision was considered as a mechanism to alleviate the pressures faced by the public sector in addressing the expansion of educational demand, the new strategy considered that private providers play an essential role in allowing the access of poor populations, “especially in areas that governments do not reach” (World Bank, 2011, p. 20). Indeed, in the past years, the Bank has emphasized the need to establish collaboration schemes between national governments and private actors, mainly through Public-Private Partnerships (PPPs) (Verger, 2012).

To characterize the most recent WB education sector approach, the 2018 *World Development Report* (WDR) is worth mentioning. This edition of the WDR has a main area of focus in education, and it was entitled *Learning to Realize Education’s Promise* (World Bank, 2018). Although in this document, the World Bank continued to stress the centrality of learning and, even, considered

that there was a “learning crisis,” the report supposed a significant discursive switch regarding education for different reasons. First, the report framed education as a basic human right that “is central to unblocking human capabilities” (World Bank, 2018, p. 38). Both the recognition of education as a human right and the reference to human capabilities represent an important departure from the traditional approaches to education characterized by an economic-instrumentalist perspective (Menashy, 2013). Second, for the first time, the World Bank acknowledges the existence of a solid body of evidence warning about the potential negative effects of private provision. Indeed, the report recognizes that, in many contexts, the superiority of the private schooling sector can be mainly explained by the fact that private schools skim off the most academically or socially advantaged students and exclude those from the most socially disadvantaged backgrounds. The 2018 WDR even affirms “there is no consistent evidence that private schools deliver better learning outcomes than public schools, or the opposite” (World Bank, 2018: 176). The World Bank also recognizes that the dramatic expansion of private provision in some national contexts “can undermine the political constituency for effective public schooling in the longer term” (World Bank, 2018, p. 177).

Future directions: which role of the World Bank in the global education arena?

Although the role and influence of the World Bank in the education sector have evolved in the past decades, the current influence of the World Bank in the definition of the global education agenda cannot be overstated. Not only does it remain the largest funder of education in the developing world, but it also holds an unmatched power in the definition of education problems and adequate policy solutions. The role of the World Bank in global goal-setting is illustrative of the ideational and normative dominance this organization enjoys. Thus, while the direct participation of the World Bank in goal-setting processes has been somewhat erratic, global education goals have been invariably influenced by the Bank’s analytic work. Likewise, the ultimate impact of global education goals is often determined by the Bank’s interpretation of such agendas.

An example of this hegemonic position is the role of the Bank in the lead-up to the WCEFA celebrated in Jomtien in 1990. Despite the World Bank’s initial reservations about the project, the organization eventually managed to repurpose the conference and EFA as an opportunity to persuade the international community of the need to prioritize primary education—in other words, as a means to vindicate basic education as a development priority for both donors and borrowing countries (Heyneman, 2009; Jones, 2007b). Moreover, while other agencies were less enthused by this approach, and the EFA agenda was eventually settled in favor of a more expansive vision, the central role of the Bank in the implementation of EFA meant that, in practice, access to primary education became the overriding EFA priority.

More recently, the negotiation of Sustainable Development Goal 4 (SDG4) was directly shaped by the “learning turn” promoted by the World Bank in the mid-2000s. The decoupling of schooling and learning emphasized in a range of World Bank’s publications ended up permeating the priorities of the major development agencies over the years to come. The prominence of the learning outcomes in the SDG4 debates cannot thus be understood without reference to the normative, research and dissemination labor led by the Bank during the previous years (Moriarty, 2019; Fontdevila, 2021). And while, as a result of civil society advocacy, the final list of targets does not feature learning as the main priority of the SDG4, over the last years, the Bank has made an effort to reinstate learning outcomes as the centerpiece of the global education agenda. For instance, in 2019, the World Bank launched the Learning Target, which aimed to “reduce by at least half the share of 10-year-olds who cannot read:” by 2030 (World Bank, 2019, p. 21). While the Learning Target was introduced as aligned with the SDG agenda, it was also framed as a more feasible goal. The new targets thus appear to be reinterpreting SDG4 by prioritizing a subset of objectives and nudging countries toward focusing their efforts on a specific goal. This is why, even if the Learning Target was framed as an effort to complement SDG4, the initiative has raised suspicion within the global education community, being perceived in certain quarters as an instance of counter-targeting (e.g., Archer, 2019).

The indirect influence of the Bank in the configuration of the SDG debate is indicative of the considerable power it retains in terms of agenda-setting and issue-definition. Yet the role of the Bank in the years to come is more of a question mark. The aid landscape has experienced a rapid transformation over the last decade—a process described by Babb and Chorev (2016) as “the loosening of the development regime,” according to which the emergence of new actors has given rise to a multipolar development arena while the material and ideational power of the World Bank and the IMF has been declining. More recently, the COVID-19 pandemic has only magnified the overall sense of volatility and uncertainty about the future of the Bretton Wood Institutions (Babb and Kentikelenis, 2021; Verbeek, 2021). In the global education arena, in particular, a crucial shift has been the emergence of new pooled funds (most notably, the Global Partnership for Education (GPE)³ and the Education Cannot Wait Fund—Menashy, 2019), which have effectively disputed the centrality of the Bank not only as a donor but also as a producer of education policy ideas. Coupled with the rise in power of new bilateral and private donors, this means that the Bank operates today in an increasingly crowded marketplace of ideas—one in which a growing number of organizations vie for the visibility and influence of their own policy proposals.

In this multipolar environment, the WB can no longer afford to operate as a *siló*—a sharply-bound, self-referential entity. Nowadays, the World Bank has a stronger incentive to cooperate and engage with other multilateral and bilateral agencies perceived as

³While the World Bank enjoyed a prominent position in the management and administration of the Fast-Track Initiative (GPE’s precursor), efforts have been made since 2010 efforts demarcate clearer boundaries between the GPE and the World Bank (Menashy, 2017).

strategically aligned or ideological affine—not only in the delivery of development projects, but also in its analytic or ideational labor. Over the last years, the WB has launched a wide range of projects developed in collaboration with different development partners—recent examples include the Global Education Finance Platform, which is oriented at the mobilization of resources for education and established in consultation with the OECD, the GPE, the IMF, UNESCO and the Education Commission; or the Global Education Evidence Advisory Panel, aimed at synthesizing evidence on effective education interventions. Such collaborative initiatives arguably reinforce the WB's legitimacy as an organization committed to cooperation and to preventing operational duplicities. Yet the ultimate impact of such partnerships on the leadership and authority of the Bank remains to be seen. As noted by *Kranke (2017)*, growing expectations for regularized collaboration between international organizations are difficult to reconcile with the need of these organizations to differentiate themselves from other agencies (i.e., preserving a distinct area of expertise or a singular policy and research agenda).

Another transformation that renders unpredictable the future of the World Bank is the growing level of heterodoxy of its policy menu and the diversification of its education ideas. The discursive shifts advanced by the 2018 WDR have only contributed to further blurring the World Bank's agenda. While the times of “short education policy menu” are definitely over, and the legacy of the Post-Washington Consensus is at best uncertain, they have not been substituted by a coherent paradigm and clear policy programs. The flexibilization and diversification of the World Bank policy agenda have been largely welcome within development circles, but it has also taken a toll in terms of institutional visibility and distinctiveness. This paradox of greater flexibility and lesser orthodoxy can potentially make the Bank equally present in educational development projects and lending but less influential in setting the direction of the global education policy agendas.

Understanding how these developments affect the World Bank's position as a “global governor” represents an important empirical challenge. This is so as the loss of the Bank's hegemony has been paralleled by a deceleration of the academic debate on this organization. Thus, the paucity of literature on the World Bank's last decade contrasts with the vibrant scholarship this institution generated during the 90s and early 2000s. While recent episodes like the 2018 WDR have been the object of some comment, this literature has tended to adopt a normative or evaluative approach. Conversely, there is more limited scholarship on the inner workings of the institution, or on the changes in the bureaucratic culture that might explain this discursive evolution. Making sense of the World Bank in a rapidly-evolving global arena requires advancing toward more fine-grained accounts of the micro-politics of this organization, and of the institutional conditions in which it operates.

UNICEF—the United Nations Children's Fund—is the United Nations' agency tasked with humanitarian and developmental aid to children worldwide. It was established in 1946, in the aftermath of World War II as United Nations International Children's Emergency Fund. Since 1953, UNICEF has been part of the United Nations System consisting of the UN's principal organs,¹ specialised agencies² and related organisations.³ Today UNICEF is one of the most prominent global welfare organisations, with a presence in 192 countries and territories. UNICEF's activities include providing immunizations and disease prevention, administering treatment for children and mothers with HIV, enhancing childhood and maternal nutrition, improving sanitation, promoting education, and providing emergency relief in response to disasters.

The United Nations succeeded a previous intergovernmental body dedicated to global coordination and the pursuit of world peace in the aftermath of World War I—the League of Nations (1920–46). Together with its extended system of organisations and agencies, the UN was conceived as central part of a multilateral system to create and maintain a 'new world order', promote social progress and advance human rights. UNICEF is an indispensable part of this multilateral system and 'new world order'. Seen in this context, UNICEF and its activities have been affected by the current crisis of multilateralism as the 'new world order' of the second half of the 20th century and its legitimacy have become questionable. We discuss some of the implications, opportunities and challenges for UNICEF's mandate in the concluding section of this article.

Education for the new world order

There are four UN agencies that have historically been more committed to the development of international educational policy-making—the United Nations Educational, Scientific and Cultural Organisation (UNESCO), the World Bank, the United Nations Children's Fund (UNICEF) and the United Nations Development Program (UNDP). While UNESCO was the first to start supporting education in new nation states, by the 1960s all UN bodies were involved with educational development in nation states to some extent (Jones, 2006).

Today, three of these bodies are considered key players in the education field: UNESCO, UNICEF and the World Bank (Mahon, 2016; Menashy and Manion, 2016; Mundy et al., 2016). Among them, UNESCO and the World Bank received detailed attention in the literature (Edwards et al., 2018; Jones, 1990; Klees et al., 2012; Mundy and Verger, 2015). Although less explored in the academic world, UNICEF is arguably the best-known agency in the UN system amid the general public. Born as a humanitarian organisation, UNICEF transformed into a development agency (Beigbeder, 2001b). Due to its practical operations, in-country presence and its ability to respond to emergencies, UNICEF enjoys an overwhelmingly positive image in the public perception, especially when compared to the other UN bodies (Jones, 2006). It also occupies a prominent place across education multilateral organisations, where it challenged more economic approaches to education policy promoted, for example, by the World Bank.

Although UNICEF's main contribution has been 'on the ground' (Mahon, 2016), in recent years the agency has also played a major role as a global development agency and, more recently, a children's rights advocate. This chapter analyses the role of UNICEF as a global children's policy agency and its role in the construction of a global (early) childhood education space. We review the

³International Organization for Migration (IOM), Comprehensive Nuclear-Test-Ban Treaty Organization Preparatory Commission (CTBT PrepCom), International Atomic Energy Agency (IAEA), Organisation for the Prohibition of Chemical Weapons (OPCW), World Trade Organization (WTO).

process by which UNICEF evolves from a temporary humanitarian relief body to a children's rights advocate and a global player in (early) childhood education in the post war 'new world order'. We conclude with some thoughts around UNICEF's role in the emerging multi-polar 'new' world order of the 21st century.

The construction of a global children's policy agency

Initially a temporary agency of the UN focused on survival of marginalised children, UNICEF transitioned to an established and large organisation with a strong mandate 'to advocate for the protection of children's rights, to help meet their basic needs and to expand their opportunities to reach their full potential'. In the turn of the 1970s the agency started moving away from humanitarian relief and transforming into a 'fully-fledged member' of the global development agencies club (Black, 1996). According to Shusterman (2021) UNICEF did not lose focus on rapid relief, but rather shifted its footing on the relief–development continuum. UNICEF redefined itself in its role, where 'emergency action for children and women [became] a limited but significant part of its overall mandate' (UNICEF, 1996, p. 1). In the agency's identity and discourse, this dual mandate is presented as a comparative advantage, where UNICEF mobilises its presence not only during but also before and after emergencies and crises.

In the late 1990s, in a third key transition, UNICEF transformed itself into children's rights advocacy organisation. Following the adoption of the Convention on the Rights of the Child (CRC) in 1990, UNICEF started to firmly bring an emphasis on human rights as a program driver in education. However, the declaration was the achievement of a movement of non-governmental organisations (NGOs), mostly based in Geneva, in which the agency had played little part. To UNICEF, Human rights were a controversial field where the organisation's involvement could jeopardise its relationships—mainly its governmental network, since cooperation with national children programmes had become its main activity (Black, 1996). Yet, the General Assembly 'endorsed UNICEF as a practical vehicle for implementing the declaration's principles, thereby implicitly expanding UNICEF's role beyond relief and general child' (Beigbeder, 2001a: 22).

UNICEF was not explicitly included in the Declaration, but anonymously referred to in the preamble as part of the 'specialized agencies and international organizations concerned with the welfare of children whose statutes include special safeguards for children' (Assembly, 1989, p. Preamble). Other specialised agencies were not interested in making human rights the centrepiece of their agenda. The World Bank, for example, historically resisted that effort (Klees and Qargha, 2014).

While the responsibility for realising the CRC lies with states, UNICEF is to encourage its effective implementation and promote international cooperation related to the Convention (Beigbeder, 2001b). The agency's role has been to pursue the CRC's universal ratification, publicise and advocate for its implementation. Considering that the CRC is an aspirational and ambiguous document the organisation also plays a role in the interpretation of what it means to protect, provide, and promote children's rights in each local context.

The consolidation of UNICEF's role as a children's rights advocate did not mean losing its focus on either humanitarian relief or development. As Coleman and Jones (2004, p. 245) argue, UNICEF's 'key transitions – from a humanitarian focus to being a development agency and then on to human rights advocacy – have seen more of a mingling of these than the serial displacement of one by another'. UNICEF's trifold identity maybe ambiguous, or even contradictory, but it certainly functions as a strength for the organisation, helping it to keep a large base of support among the general public.

There has been, however, some vocal opposition to UNICEF's adaptation of a broad children's rights agenda. To give just one example, in 2004, the right-wing Oakland (US)-based think tank The Independent Institute (declared mission: '[...] to boldly advance peaceful, prosperous, and free societies grounded in a commitment to human worth and dignity.') published strongly worded criticism of what it terms 'UNICEF's implementation of its "children's rights" vision', especially in relation to UNICEF's focus on the rights of girls and women in family and society: 'Indeed, UNICEF's Medium Term Strategic Plan is more of a blueprint for social engineering along radical feminist lines' (<https://www.independent.org/news/article.asp?id=1443>). This is a clearly tendentious statement, aiming to undermine international advocacy for children's rights, considering it is coming from a right-wing organisation in the only country that has persistently denied ratification of the Convention on the Rights of the Child. It is questionable, too, as a meta-evaluation of UNICEF program evaluations by the OECD's Development Assistance Committee found that 'only one-third of the evaluations were able to demonstrate that UNICEF-supported programs effectively address gender equality' (OECD, 2013, p. 62). The authors conclude that 'UNICEF's performance with respect to gender equality is a serious concern' (ibid).

Some argue that, in the last decade, UNICEF is undergoing a fourth transition from a human rights approach into an equity focus, based on the argument that 'human rights cannot be realized so long as inequality persists' (UNICEF 2010, p. 19 cited in Klees and Qargha, 2014). This 'refocus' on equity can also be seen in the rationale of the Global Partnership for Education (GPE) and Education Cannot Wait (ECW). Founded in 2002, GPE is the largest multistakeholder agency in the sector; it is chaired by the World Bank and coordinated by UNICEF at the national level (Silva and Oliveira, 2021). ECW is a more recent multistakeholder global pooled fund that UNICEF has hosted since its incubation (Menashy, 2019). Some have questioned UNICEF's role in these partnerships, but specially in ECW, since the organisation may be both a funder and a potential fund-seeker on the ground (Menashy, 2019). In any case, this illustrates UNICEF has taken up a role in the relatively new trend of multistakeholder partnerships in international development.

Organisational configurations in times of change

With its particular history and tri-faceted role, UNICEF's organisational structure fundamentally differs from the rest of the UN bodies. While the World Bank and UNESCO are considered autonomous 'specialised agencies', UNICEF is accountable to the UN General Assembly (Beigbeder, 2001b; Menashy and Manion, 2016). Also, unlike other UN bodies, UNICEF's budget is met in full through voluntary contributions from different actors, including public national and supranational organisations (governments, European Commission, inter-organizational arrangements, global program partnerships and international financial institutions) (Mundy et al., 2016). A significant amount of the organisation's revenue comes from contributions of member states, with the United States of America, Germany, and the United Kingdom being the two largest contributors, which increases their decision-making power and influence (Mundy et al., 2016).

Private organisations and the general public are UNICEF's other contributors. This funding model has profound implications for the way the organisation operates. UNICEF is a donor-driven organisation that continuously needs to demonstrate and advertise its work not only to inform donors and the public about its work but, more importantly, 'sending public messages on its policies in an effort to influence national and international decision makers and obtain the support of public opinion for policies' (Beigbeder, 2001b, p. 145). Associated with this is fundraising, a central characteristic of UNICEF's identity, which brings it closer to how non-profit organisations operate.

As Mundy et al. (2016) argues, these features contribute to an organisational structure that is able to elude the criticism that has fallen on other UN bodies, such as UNESCO and the World Bank. Hence, compared to other UN agencies, UNICEF has a stronger legitimacy to advocate for children's rights. UNICEF's advocacy has consistently corresponded with a strong presence 'on the ground' and its presence in shaping the global (early) childhood agenda.

The construction of a global (early) childhood education space

UNICEF's initial agenda did not include education, except from maternal education programmes (Beigbeder, 2001a). The organisation struggled for decades to find its role and own positioning in the education field. In the new century UNICEF has been able to solidify its role as a major global player (Jones, 2006). In a rapidly expanding and diversifying network of development programs, the agency saw education as an area where it could position itself (Coleman and Jones, 2004). Its education advocacy started with an emphasis on informal education, rather than formal schooling. UNICEF's interests expanded progressively to most areas of education, from primary education and the education of girls to early childhood education and care (ECEC).

The concept of early childhood has entered UNICEF and other global players' agendas broadly since the beginning of the 21st century. That means it is not long ago that many international organisations, as well as national governments assumed young children to be primarily a domestic matter, with only very limited public or state responsibility for young children's care and education. Rather than providing education for all young children from a young age as a common good, early childhood services were often seen as necessary intervention in 'dysfunctional' families.

In many cases, state governments remain reluctant to enter the early childhood space for purposes other than general legislation and regulation, and services are often provided by non- and semi-state actors (e.g., charitable, community, or welfare organisations) and to a large extent by private-for-profit providers. A broad acceptance of the concept of ECEC helped promote the education and care of young children become to a global issue. This acknowledgment of ECEC and its expansion can be traced back to the rise of recent knowledge claims around young children (Mahon, 2016), including: the neuroscientific development of young children's brains; their economic potential as human capital and the return of investment on young children; the investment in ECEC as the 'greatest equaliser' of socioeconomic and gender inequalities; and the rights discourse, among other traveling ideas (Morabito et al., 2013). As in most international agencies, UNICEF's international webpage on early childhood reads

Children's brains are built, moment by moment, as they interact with their environments. In the first few years of life, more than one million neural connections are formed each second – a pace never repeated again. The quality of a child's early experiences makes a critical difference as their brains develop, providing either strong or weak foundations for learning, health and behaviour throughout life (<https://www.unicef.org/early-childhood-development>)

All these lines of argument are highly contested and are subject to interrogation, especially by scholars grounded in critical theory, critical pedagogy, anti-colonialist scholarship and indigenous epistemologies (e.g., Apple, 2003; Bloch et al., 2018; Brayboy, 2005; Chiara, 2020; Gupta, 2006; Nsamenang, 2004; Pence and Marfo, 2008; Steiner-Khamisi et al., 2018). Nonetheless, they have provided powerful arguments to increase attention and investment in early childhood education and care.

The discourse—and its critique—condense in a central concept that continues to drive international and national early childhood policy debate: *quality*. In itself a highly contested term, the quest for *quality* has become the most influential driver of early childhood policy globally. Its efficacy has been compared to 'the irresistibility of a steamroller' by German author Burkhard Müller in an early analysis: steamrollers are powerful, effective—but tend to flatten everything in their way (Müller, 1996, p. 8, our translation). It has led early childhood advocates into a dilemma that appears impossible to resolve:

Indeed, for those of us who value ECE but dislike the story of quality and high returns, the awkward fact is that the contemporary expansion of early childhood education would not have happened without this discourse gaining dominance.

(Moss, 2017, p. 14).

The core of the critique of the discourse of quality is that it renders a value-bound and hence contested and profoundly political social practice—the education of young children—as a practice of applied technology, certainty and, if done right, one of (pre)determinable outcomes. In the international discourse, *quality* has assumed a hegemonic position, has become unquestionable and, as such, amounts to early childhood education policy's very own regime—its *general politics*—of truth (Foucault and Rabinow, 1991; Urban, 2022 in preparation).

UNICEF and the politics of global childhood

With its global recognition and its programmes bridging the global south and north, it is not surprising that UNICEF activities and strategies are affected by—and contributing to—the dilemma of the construction of a global imaginary of children, childhood and early childhood education as captured in the debate about *quality* and other dominant paradigms. This becomes apparent, for instance, in anti-colonialist critiques of UNICEF and other global development operators' depiction of children in the global south in order to raise funds from donors in the global north. A recent analysis of UNICEF by the activist website karmacolonialism.org found 1390 references to the 'needy child' on UNICEF webpages, with the term 'twice as likely to be used on a page for Africa' than on pages referring to global north countries, and the 'needy' child in question overwhelmingly a girl (Alyson, 2021).

However, UNICEF has become an increasingly vocal advocate in the area of national early childhood policy development, policy monitoring, and accountability. Arguably, UNICEF's influence on national policies can be seen on a level similar only to the OECD's early childhood 'Starting Strong' policy initiatives (OECD, 2001, 2006, 2009, 2010, 2012; 2015a; 2015b, 2017). UNICEF's exercises its ECEC policy advocacy mainly through the UNICEF Innocenti Research Center, based in Florence, Italy. The Innocenti Center (officially: UNICEF Office of Research – Innocenti) was established in 1988 to 'strengthen the research capability of the United Nations Children's Fund and to support its advocacy for children worldwide'. According to its mission statement the center 'generates knowledge and analysis to support policy formulation and advocacy in favor of children; acts as a convener and catalyst for knowledge exchange and strategic reflections on children's concerns; and supports program development and capacity-building' (www.unicef-irc.org). One of the center's most recognised tools for policy advocacy are its 'report cards'—short, focused publications that measure countries' progress against declared early childhood policy aims. Unlike UNICEF's appeals for support of its programmes in the global south, these documents have targeted 'economically advanced' and 'rich' countries. Examples include the widely cited *Report Cards 8* and *16*: 'The child care transition. A league table of early childhood education and care in economically advanced countries' and 'Worlds of Influence: Understanding What Shapes Child Well-being in Rich Countries' (UNICEF Innocenti Research Center, 2008, 2020).

The OECD has been criticised for exerting significant but unaccountable 'soft power' on national education systems (Auld and Morris, 2016; Auld et al., 2019; Kaurel, 2020; Morris, 2016). UNICEF, arguably, has entered the very same space, albeit from a decisively children's rights-based perspective. With its global reach and visibility, UNICEF's approach is distinct from that of another influential 'global player' in the field of early childhood policy: the World Bank and its regional arms. Compared to UNICEF they have considerable 'hard power' at their disposal to shape countries' education policies through funding and loan arrangements (Klees et al., 2012; Steiner-Khamsi, 2013; Steiner-Khamsi et al., 2018).

Conclusion

In only six decades, UNICEF has evolved from a UN temporary humanitarian relief body to a global development agency, a children's rights advocate, and a driver of multistakeholder partnerships. As shown above, each of UNICEF's transitions did not imply a complete transformation, but rather a new dimension of the organisation's identity being developed. UNICEF continues to play a role in crises, while also implementing a global agenda on children's policies, all under the umbrella of children's rights. Its multifaceted role, we argued, is one of the keys to its success in being able to take part in the international organisation's 'club' but maintain an overwhelming positive image among the general public.

The involvement of UNICEF in education is quite recent. As argued in this chapter, the organisation struggled for years to find its place in the global education field. In fact, its approach to education did not solidify until the organisation undertook the mandate of promoting the UNCRC. Today, UNICEF is one of the main partners in the largest multistakeholder partnerships that promote education, and young children's rights. We have argued that UNICEF, with its different arms and strategies, exercises a significant but unaccountable amount of 'soft power', which may be rendered invisible since it comes from a decisively children's rights-based perspective.

The crucial question for UNICEF will be how and to what extent it will be able to use its 'soft power' in the dramatically changed context of the 21st century. Today, the 'new world order' that brought about UNICEF and its sister agencies in the UN space in the second half of the 20th century is fractured (at best). Its legitimacy has become questionable not least by the failure of UN

institutions to provide effective global governance, representing the interests of all of humanity as it faces a convergence of existential crises: climate, biodiversity, pandemic, democracy, equity. The apparent failure of global governance stands in contrast to UNICEF's efficacy 'on the ground', e.g., in providing concrete support for children through its programmes.

The litmus test, we would argue, will be whether UNICEF will be able to reposition itself as the boundaries between 'developed' and 'developing' countries, between global south and north, are increasingly blurred. This is particularly relevant in relation to young children, who as UNICEF warns are about to become the 'silent victims' of the globally entangled crises scenario (UNICEF, 2020). Where one UNICEF could safely focus on marginalised children in the global south, it is becoming apparent that, as Santos and other anti-colonialist scholars argue, the global south is no longer a geographical location (Chiara, 2020; Santos, 2018). Locating the new 'global south' has become a largely geo-political question, as the *terra firma* of 'us' and 'them' turns into a global archipelago of islands of deprivation, marginalisation and exclusion in a rising sea of inequality.

UNICEF underwent most of its transitions in the context of a post war 'new world order'. Its ground operations and its rights-based approach have helped the agency construct itself as a legitimate advocate for children. At a crossroads of multiple global crises, and with the world shifting toward multi-polar 'new' world (dis)order of the 21st century, will UNICEF grow into a possible new role as one of the legitimate agents of much needed global multi-lateral coordination?

Introduction

This article outlines the nature of the European Union (EU) as a *sui generis* political system with policy capacity in support of supranational integration and Europeanization and identifies the implications of this nature for European education policy developments. In so doing, it privileges the perspective of European governance and that which occurs at the EU level rather than in domestic education systems across Europe.

Since the creation of the EU with its particular, hybrid nature, scholars have mobilized theories, concepts, and methods from across disciplines (international relations, political science, and sociology) and subfields (comparative politics, policy sociology) to account for supranational integration within and beyond the European region (Wiener et al., 2019), the institutionalization of the EU (Georgakakis, 2011), and the way it functions as a political system (Costa and Brack, 2019), but also to examine the EU's influence on member states, and vice-versa, as well as the horizontal (across member states) diffusion of discourses, identities, political structures, and public policies (Radaelli, 2003; Graziano and Vink, 2008). Alongside these studies, a rich cluster of sociological and governance-focused frameworks have been adopted to understand broader EU dynamics (Rowell and Mangenot, 2016). Recognizing that neither EU institutions nor member states are monolithic actors (Kohler-Koch and Eising, 1999), these frameworks place actors at the center of analyses. Accordingly, some sociologists have been inspired by critical and post-positivist approaches to make the EU political arena their focus (Georgakakis and Weisben, 2010), while others have considered the multi-level, non-hierarchical configuration of the EU's socioeconomic and political system (Peters and Pierre, 1998) and examined interactions among actors (individuals and corporate; public and private), their resources, strategies, interests, and constraints (Rhodes, 1997; Rhodes et al., 1996). With few exceptions (cf. Bevir and Phillips, 2019), much of this literature disregards education as an object of study; nonetheless, scholars concerned with education policy across disciplines (education, sociology, and political science) often draw on these studies either explicitly or implicitly to assess the implications of supranational integration and Europeanization for education policy and the governance of education (including, among others: Dale and Robertson, 2009; Lawn and Grek, 2012; Lawn and Normand, 2015; Vatrella and Milana, 2019; Sørensen et al., 2021).

This article begins by providing an overview of supranational integration, Europeanization, and the EU political system so as to appreciate the position education has come to hold in this system and its implications for policy developments. The article then assumes the perspective of European governance and the instruments that substantiate it, particularly expert groups. This perspective acknowledges that both EU institutions and various policy actors matter for the formation of European education policy and the educationalization of public policy in the EU. In this vein, attention is also paid to the European Semester, a novel architecture for EU socio-economic policy coordination that is reconfiguring the policy capacity of a plurality of actors, as an aspect deserving of further attention by education policy researchers.

Supranational integration, Europeanization, and education policy

Officially formed as the EU in 1993 (when the Maastricht Treaty entered into force), this entity's foundation dates to the 1950s when a regional organization, the European Economic Community (1957), was established to bring about economic integration by setting up a common market and customs union among six countries. These countries had come together after World War II to integrate the coal and steel industry by forming the European Coal and Steel Community (1951) and thereby averting the mobilization of a new armed force in the region. Today, the EU is considered an important actor in the global economy, security, health, and international affairs, and plays a growing role in education. It represents a unique economic and political coalition of 27

countries (following the withdrawal of the United Kingdom's membership in 2019) located in geographical proximity to one another and which together cover an area of approximately 4 million km², a large part of the corresponding continent, and host a population of almost 447 million people as of 2020. The EU's uniqueness lies in its pooled sovereignty through which member states remain independent sovereign nations but delegate part of their decision-making powers to the institutions of the EU. Although these institutions act within the limits of the powers conferred on them by the founding Treaty, member states can opt to revise the Treaty. The Lisbon Treaty, enforced in 2009, purposely adjusted the EU decision-making process to increase the power of national parliaments and give more voice to European citizens (Costa and Brack, 2019). Unlike federations of states like the United States of America or international organizations based on co-operation between governments like the United Nations (UN) or Organization for Economic Cooperation and Development (OECD), therefore, member states in the EU not only coordinate their policies through intergovernmental cooperation but also engage in joint decision-making. This leads to supranational integration (CVCE, 2016) or "the formation of economic and/or political linkages among countries that are geographically near to each other" (Graziano and Vink, 2008, pp. 7–8) and brings about transformations in the institutions, policies, ideas, etc. that constitute and explain Europeanization (Graziano and Vink, 2013).

Since the creation of the European Communities, scholars have used various approaches to comprehend supranational integration, Europeanization, and the very nature of the EU as an entity that, as neither a federal state nor a typical international organization, represents a *sui generis* political system with its own institutional architecture (Hix and Hoyland, 2011; Costa and Brack, 2019). Originally, international relations scholars developed grand theories such as neo-functionalism or intergovernmentalism to explain supranational integration as a functional necessity (Haas, 1958) or the factors behind the construction of "an international regime for policy coordination" (Moravcsik, 1993, p. 480). Over time, both of these grand theories have come under critique. Neo-functionalism specifically has been called into question for viewing the expansion of EU institutions' authority from the economic to the political domain as a simple spillover over effect and underplaying the significance of domestic political processes and structures; intergovernmentalism has been criticized for giving too much weight to national leaders' rational choice to better manage their interests through supranational integration as the reason for their support of Europeanization (Costa and Brack, 2019). Although these theories might be seen as complementary rather than opposed (cf. Wiener et al., 2019), some scholars, drawing on comparative politics, reject both of these normative perspectives to assert an analytical recognition of the EU as a specific form of federalism with a factual decision-making center (e.g. the EU institutional architecture) in which member states' interests and willingness play a vital role (Börzel and Hosli, 2003).

New grand theories were thus developed following the Maastrich and Lisbon treaties. For instance, post-functionalism attempts to better capture the coupling of national and EU politics by granting attention to interest groups well outside the economic arena (Hooghe and Marks, 2001) whereas new intergovernmentalism recognizes the centrality EU institutions have acquired in important policy domains (e.g. economic governance) as well as the weakened relative role EU institutions play in determining the direction and nature of supranational integration (Bickerton et al., 2015). Alongside these developments, multiple middle-theories and conceptual approaches have also been formulated drawing on political science (particularly comparative politics) and sociology. For instance, different "new institutionalisms" (Hall and Taylor, 1996) largely "agree on the importance of institutions (*institutions matter*) and believe that they influence the political process and the EU's public policy and consequently confirm their impact on the European integration process in the long term" (Costa and Brack, 2019, p. 56, emphasis in the original). These approaches have led to studies examining the EU as a political system on its own terms (Hix and Hoyland, 2011).

Also in the wake of the Maastrich Treaty, scholars have employed various perspectives to investigate Europeanization, that is, the effects of supranational integration. As Costa and Brack (2019) note, these encompass: (1) a top-down or "downloading" perspective that casts member states as passive recipients of policy and visions consolidated at the EU level; (2) a bottom-up or "uploading" perspective that considers how national governments and other private and public institutions influence EU policy; (3) a "horizontal" perspective emphasizing the transfer of politics, policies and policy-making between member states; and (4) a perspective that, combining all of the above, conceptualizes Europeanization as the outcome of EU member states' constant interactions as well as horizontal diffusion processes. However, Europeanization as a research object also remains a matter of methodological debate as it is not always clear the extent to which it captures something which is substantially different from the effects of non-EU specific phenomena (e.g. globalization) (cf. among others Radaelli, 2002; Graziano and Vink, 2008). There thus remains a great deal of confusion as to the causes and effects of Europeanization (Costa and Brack, 2019). Having acknowledged all these points, a comprehensive definition of Europeanization points at:

a process of (a) construction, (b) diffusion, and (c) institutionalization of formal and informal rules, procedures, policy paradigms, styles, "ways of doing things", and shared beliefs and norms which are first defined and consolidated in the making of EU public policy and politics and then incorporated in the logic of domestic discourse, identities, political structures, and public policies.

Radaelli (2003, p. 30).

Accordingly, the making of EU education policy is not independent from the EU political system and the position education has come to hold within this system.

The EU political system and education

Although it is hard to establish a clear-cut separation between executive and political powers among EU institutions, the EU political system can be described as a quadripartite structure with the European Council and European Commission holding executive power while the European Parliament and Council of the European Union hold legislative power (Costa and Brack, 2019). The European Council, conceptualized as “a collective Head of State” (Costa and Brack, 2019, p. 76), is composed of the heads of state or government of all member states, the President of the Council, and the President of the European Commission. It decides on the overall political direction of the EU and sets its policy agenda and priorities. These often encompass education-related actions, goals, and long-term priorities. The European Commission (hereafter the Commission) has been compared to a government by virtue of its central administration and is comprised of one commissioner per member state as well as over 32,000 policy officers, researchers, lawyers, and translators. It represents the interests of the EU, implements its decisions, manages its budget and programs, and is the only institution empowered to initiate EU legislation and represent the EU outside of Europe. Much attention has thus been paid to tensions deriving from the nature of the Commission, with its combination of administrative functions and political leadership (Christiansen, 2006), and many concur that it has acquired increased political influence over time (Cisotta, 2013) on many matters, including education (Eeva, 2018; Gornitzka, 2009; Krick and Gornitzka, 2019). The European Parliament (hereafter the Parliament), and Council of the European Union (hereafter the Council) have been likened to “a kind of bicameral parliament” (Costa and Brack, 2019, p. 116). On the one hand, the Parliament, made up of representatives elected directly by European citizens, is a co-legislator on equal footing with the Council and co-responsible for adopting EU legislation; it also holds budgetary and supervisory powers. Each member of the Parliament may join both informal groups and formal groups based on political affiliation and specialized committees focused on education-related matters (e.g. Culture and Education—CULT, Employment and Social Affairs—EMPL Committee). Consequently, the Parliament’s political influence is seen to depend on its members’ ability to organize deliberations (Costa and Brack, 2019). On the other hand, the Council, an equal co-legislator with the Parliament, represents member states through their ministries and is organized into ten policy areas (e.g. Education, Youth, Culture and Sport—EYCS; Employment, Social Policy, Health and Consumer Affairs—EPSCO). The Council thus coordinates member states in relation to economic and fiscal policies, education policies (associated with culture, youth, and sport), and employment policies.

In accordance with the subsidiarity principle, the EU political system has exclusive competence over certain policy areas (e.g. the internal market, customs union, monetary policy for euro countries) and shared or supporting competence over others (e.g. social policy, health). Since the Maastricht Treaty, education has been among the EU’s supporting competences. Accordingly, a number of historical accounts employing diverse theoretical perspectives have revealed how complex intergovernmental cooperation in the educational sphere is in the EU, demonstrating that “actual cooperation [in education] proceeded only slowly, as a by-product of the gradual development of the common market” (Rasmussen, 2014, p. 19) but has intensified at an extraordinary pace following the Lisbon Agenda (2000) through the growing use of standards (Lawn and Grek, 2012) and interaction among actors (i.e. networks) (Gornitzka, 2009).

Although archival research shows that there have been discussions around the role of communitarian education initiatives in fostering the European project since the 1950s, no mention of education was made in the Treaty (1957) setting up the European Community (St. John, 2021). Vocational training has been a sensitive issue since the 1950s (Milana, 2008) and economic support for training activities has been available since 1951 via the European Social Fund; nevertheless, the idea of a common vocational training policy, for instance, initially had little impact. In 1975, however, this idea led to the creation of the European Center for the Development of Vocational Training (CEDEFOP), to support the harmonization of communitarian policies (Pépin, 2006), and its twin agency the European Training Foundation (ETF), in 1990, to support reforms in non-EU countries. Similarly, an action program for European cooperation in education launched in the mid-1970s through a Council resolution was met with resistance from the ministries of a few member states (Rasmussen, 2014) but nonetheless paved the way for more Community action in education and training from the 1980s onwards (e.g. Erasmus program) (St. John, 2021). Intergovernmental cooperation in education has gradually expanded from that point on (Rasmussen, 2014), leading to the introduction of the subsidiarity principle in response to member states’ fear that the EU would otherwise centralize power over education as well (Amaral et al., 2009). However, the subsidiary principle is open to diverse interpretations (Føllesdal, 1998) and does not necessarily stem EU “encroachment” on national education decision-making. For instance, from the mid-1990s onward lifelong learning became the object of EU policy changes aimed at tackling wide-ranging economic and social issues under the banner of economic policy (Volles, 2016). In contrast, it was the education ministries of 29 countries—all EU members (15) or candidate members (10) at the time, plus Iceland, Liechtenstein, Norway, and Switzerland—that first agreed on greater intergovernmental cooperation in higher education, thereby giving rise to the Bologna process (1999) with no direct involvement by EU institutions at that time. This development demonstrates that member states “were apparently prepared to loosen their embrace of the principle of subsidiarity” (Amaral et al., 2009, p. 7), and may explain why, when the European Council agreed on the Lisbon Agenda in 2000, member states not only opted for a EU frame to modernize education through intergovernmental cooperation (aka the Education and Training work program) but also set aside their original resistance and allowed EU institutions to become involved in the Bologna process.

Stipulated alongside the Lisbon Agenda (2000) was the Open Method of Coordination, a mechanism through which the European Council agrees on broad policy goals and guidelines that member states then translate into national and regional policies, as well as monitoring and evaluation benchmarks and indicators overseen by the EU political system (Eggermont, 2012). Many observers thus agree that, through the Open Method of Coordination, member states have given the EU political system a mandate to develop a regional approach and common objectives in education as well (see, among others: Hingel, 2001; Ertl, 2006; Nóvoa

and de Jong-Lambert, 2003; Milana, 2014). This is evidenced by the advancement of the Bologna process, now a complex mechanism supporting cooperation in higher education among 48 governments—representing almost the totality of the European continent—and the European Commission. Its current architecture, based on extensive standardization devices and monitoring practices operating under the Open Method of Coordination, has come to represent “a regulative technology designed to govern at a distance [that] reaches deep into the ontological matter of everyday working life in higher education organizations” (Brøgger, 2019, p. 4) across EU member states and beyond. While the Bologna process was initiated as a form of intergovernmental cooperation supporting horizontal integration, therefore, the Lisbon Agenda—a supranational process supporting vertical integration in multiple arenas including education—represented a turning point in terms of European integration efforts increasingly affecting education through European governance.

European governance, policy coordination, and education

European governance is the regional regime underlying public action in the EU (Bevir, 2019), action that is based on multi-level relations in that it creates connections among EU institutions, national governments, and other regional and local authorities. It supports supranational integration and Europeanization through a mix of “hard” and “soft” mechanisms (Trubek et al., 2005), with the former operating “through rules that arise from treaties, directives and regulations” while the latter create “non-binding rules that are nevertheless expected to produce effects in practice” (Maggetti, 2015, p. 252) through flexible structures and arrangements (i.e. committees, task forces, working groups, expert groups, etc.). As seen in the previous sections, hard governance manifests in the EU political system in charge of defining and guaranteeing the operation of EU institutions: this is stronger in the areas of exclusive EU competence (e.g. the internal market) and softer in areas, like education, in which the EU has only supporting competences. In addition, in areas of shared competences (e.g. economic, and social policies), the EU, like member states, sometimes passes laws and regulations that may have (intended and unintended) effects on education as well. There is thus a mix of hard and soft mechanisms operating in diverse policy domains that can influence European education policy, including the most deeply-studied mechanism of the Open Method of Coordination (see, among others: Brøgger, 2019; Chatzopoulou, 2015; Ravinet, 2008; Tholoniati, 2010; Walters and Haahr, 2005). In order for policies agreed on at the EU level to prompt action by national governments and other regional and local authorities in areas of supporting competence, however, European governance requires coordinated action. Both the Education and Training work program (2000-onwards) and the European agenda on adult learning (2006-onwards) illustrate this point.

In the wake of the Lisbon Agenda, with the agreement on *The concrete future objectives of education systems* (European Commission, 2001) a comprehensive approach to education was first laid out at the EU level with the aim of increasing the quality and effectiveness of national education and training systems, facilitating better access for all, and opening up European education and training systems to the wider world. This led to the *Education and Training 2010* work program as the agreement’s operational arm. In keeping with its implementation, the Council set up a Strategic Framework for European Cooperation in education and training: *Education and Training 2020* (Council of the European Union, 2009). This strategic framework, “spanning education and training systems as a whole in a lifelong learning perspective” (Council of the European Union, 2009, p. 2), served as a policy umbrella for several parallel processes in higher education, vocational education and training, etc. Alongside the progression of the Education and Training work programs, a dedicated agenda on adult learning was also established at the EU level, the developments of which were examined recently (Milana and Klatt, 2019). Initially, naming 1996 as the European year of lifelong learning and the Council’s *Resolution on lifelong learning* (June 2002) laid the groundwork for adult learning to emerge as a distinctive policy domain at the EU level. At this stage, the adult learning side of lifelong learning was teased out in dialog between EU institutions and went to bolster ties between education, training and employment policies. EU institutions then concentrated on existing statistical data gaps at the microlevel (learner-centered) and more robust knowledge exchange and collaboration across member states and with other international organizations with an interest in adult and further education (such as the OECD). With the 2006 *Communication of the European Commission Adult Learning: it is never too late to learn* (European Commission, 2006) and Council’s Conclusions on adult learning (Council of the European Union, 2008), adult learning was established as a clearly defined policy domain. However, the outbreak of the 2009 global financial crisis also impinged on efforts to fine-tune a dedicated agenda on adult learning, so in 2011 the Council approved a *Resolution on a renewed European agenda for adult learning* that reinforced the links at EU level between adult learning and other policy domains (e.g. education and training, employment, macroeconomic policies).

Both *Education and Training 2020* and the *Renewed European agenda for adult learning* rely on a variety of mechanisms and policy instruments to ease policy coordination efforts on the part of EU institutions (and the Commission particularly) and bring about changes in domestic education systems. However, policy influence does not necessarily take place from the top down (from the EU to member states); rather, it works as a loop in which a plurality of policy actors partake. There are several mechanisms and policy instruments that can be taken as illustrating this loop, including standard-setting, capacity-building, elite-learning, and financial redistribution. Various characterized in the literature on supranational governance (cf. Dale, 1999; Lawn, 2011; Martens and Jakobi, 2010; Ozga et al., 2011; Woodward, 2009), these mechanisms have been examined in recent research on the European governance of lifelong learning (Milana et al., 2020a). Each of these mutually dependent mechanisms relies on a set of policy instruments. Specifically, standard-setting (a mechanism) involves taking normative actions and setting common goals that converge to establish a single, clear-cut European model in a specific policy domain (higher education, adult learning, etc.). This mechanism operates through implicit and explicit benchmarks (an instrument), namely the EU-established standards by which member state

performance is measured and compared and their level of quality judged. However, EU benchmarks are themselves the result of complex negotiations among heads of states and governments and their ministerial complements at EU institutions. Such negotiations thus imply capacity-building (a mechanism) to orient heads of states and governments and their ministerial complements in the direction of identifying policy solutions to what are perceived as common problems (e.g. high rates of adults with low levels of education and literacy). Capacity-building is facilitated by various policy instruments such as data generation, mutual- and peer-learning arrangements, and expert groups assembled by the Commission under the Open Method of Coordination framework to tackle specific issues (e.g. digital skills) for a certain amount of time. These instruments work more fruitfully in interaction with one another than they do in isolation. Specially, data generation encompasses the work of gathering quantitative and/or qualitative data, the method used to generate such data, and the procedure through which data is organized. And yet one of the instruments through which generated data circulates, and more data is generated, is the set of mutual- and peer-learning arrangements catering to member state representatives together with Commission staff members (among others) to help them identify and learn about ongoing initiatives in a certain area (i.e. the upskilling of low-skilled adults). Increasingly, one of the main collective actors to take advantage of these types of arrangements are expert groups.

Table 1 illustrates how the above-mentioned instruments are concretized in practice, thus contributing to the influence loop among the plurality of policy actors involved in European education policy (cf. [Milana et al., 2020a](#)). Against this backdrop, expert groups merit particular attention.

Expert groups and the network governance of (European) education

Expert groups are consultative bodies set up by the Commission or its departments for advisory purposes, but which under the principles of the Open Method of Coordination are engaged in fostering mutual learning, the exchange of good practice, and socialization among their members. These experts include representatives from member states, candidate countries, European Free Trade Association countries, and relevant EU bodies or agencies (e.g. CEDEFOP, ETF) as well as education and training associations and European social partners (e.g. the European Trade Union Confederation). As mentioned above, the Open Method of Coordination has been used extensively since the Lisbon Agenda to promote supranational integration and Europeanization in education, and expert groups have become essential for coordinating education policy at EU level (cf. [Gornitzka, 2009](#); [Krick and Gornitzka, 2019](#)) through a form of network governance “which is substantially alternative to both centralized government at the community level and to national government in single member states” ([Milana et al., 2000b](#), p. 32).

Current education policy research employs different methodological approaches for analyzing networks, and recognizes these approaches to be valuable ([Menashy and Verger, 2019](#)). One of these is Social Network Analysis ([Borgatti et al., 2009](#)), an approach recently used to delve into the structural configuration of the networks, and relationships among actors, formed as part of the activity of the expert groups active under the Education and Training work program, and in the adult learning domain (see **Table 1**) ([Milana et al., 2020b](#)). By applying Social Network Analysis, this study was able to conduct a structural analysis of relational phenomena (i.e. the emergent effect of the bonds between institutional actors) generated and/or reinforced by the establishment of expert groups in each of the policy domains under consideration (education and training vs. adult learning). To clarify, the forms of network governance in these two domains are not independent but rather connected through a specific expert group (the ET2020 Working Group on Adult Learning, cf. **Table 1**) whose actors are thus involved in both domains. The analysis brought attention to the mutual constitutiveness of a social network and its members as well as the potential power within and of a network to contribute to developments in European education policy. For instance, striking similarities were found across education and training vs. adult learning considered as distinct policy domains, suggesting that two national agencies—the Flemish Department of Education and Training (Belgium) and Finland’s Ministry of Education and Culture—stand out as institutional actors displaying a high degree of cohesiveness in both forms of network governance (education and training vs. adult learning). Meanwhile, remarkable differences between the two policy domains attest to the centrality achieved by organizations lobbying on behalf of workers and trades at the EU level. For instance, while the three major unions (i.e. European Trade Union Committee for Education, European Trade Union Confederation, and European Federation of Education Employers) were among the main “brokers” in the education and training network, these organizations have comparatively less connectivity and brokerage capacity in the adult learning network. Theoretically, greater centrality in a network is thought to entail better access to the information, material resources and/or relationships that represent important factors in decision-making. Moreover, high rates of integration and brokerage connectivity in a network are understood to unlock more possibilities for influencing others. Both aspects are important for more efficient policy coordination in areas of EU supporting competence like education where EU policies are not prescribed but “formed” through soft governance mechanisms and policy instruments such as expert groups. At the same time, however, “the practical effects of a high level of centrality are also dependent on individual capacities and organizational backing” ([Milana et al., 2020b](#), p. 45), two aspects that the authors did not consider in their study and which merit future attention.

Complicating the picture of European governance, a novel socio-economic architecture for EU policy coordination known as the European Semester has been developing over the last decade, affecting many domains including education and is thus worth examining.

Table 1 Examples of policy instruments in practice.

<i>Education and training 2020</i>	<i>Policy instruments</i>	<i>The European agendas for adult learning</i>
ET2020 working group on vocational education and training ET2020 working group on digital skills and competences ET2020 working group on modernization of higher education ET2020 working group on promoting citizenship and the common values of freedom, tolerance and non-discrimination through education ET2020 working group on schools ET2020 working group on adult learning In-depth country workshops—focus on policy development and practice in selected member states with the aim of identifying key factors for policy success. Peer learning activities—involve national experts in learning together based on evidence and experience and sharing both positive and negative policy experiences. Peer-counseling—a voluntary tool that brings together “professional peers from a small number of national administrations to provide external advice to a country in the process of a significant policy development” (European commission, 2015, p. 1) Other—ad hoc peer learning activities, thematic events, peer reviews, and policy learning exchanges. Education and training monitor—includes quantitative, comparative analyses and country-specific recommendations based on eurostat and OECD data. Country reports—annual individual country reports identify where each country stands in relation to the ET 2020 benchmarks and other indicators. Studies and reports—(e.g. <i>Promoting adult learning in the workplace</i>. Final report of the ET, 2020 working group, 2016–2018 on adult learning, see: WGAL 2018) Guidelines—(e.g. 20 guiding principles for high-performance apprenticeships and work-based learning in the 2014–2015 period, see: WGVET, 2017). Policy conclusions—(e.g. Higher education institutions as centers of regional development and innovation, see: WGMHE, 2016). Other—recommendations, background papers, flash reports, etc. At least 95% of children should participate in early childhood education Fewer than 15% of 15-year-olds should be under-skilled in reading, mathematics and science The rate of early leavers from education and training aged 18–24 should be below 10% At least 40% of people aged 30–34 should have completed some form of higher education At least 20% of higher education graduates and 6% of 18–34 year-olds with an initial vocational qualification should have spent some time studying or training abroad The share of employed graduates (aged 20–34 with at least upper secondary education attainment and having left education 1–3 years ago) should be at least 82%	Coordinated working groups/networks Mutual- and peer-learning arrangements Data generation Benchmarks	Working group on the implementation of the action plan on adult learning Thematic working group on quality assurance in adult learning Thematic working group on financing adult learning National coordinators implementing the european agenda on adult learning Regional meetings organized by the working group on the implementation of the action plan on adult learning (2008–2010). Workshops with country experts to hold in-depth discussions of topics (e.g. improving quality in adult learning, effective policies for increasing adults’ participation in basic skills provision). Conferences sponsored by the european commission (e.g. Adult skills conference: Empowering people, 6–7 December 2016) or in collaboration with other international organizations (e.g. Equipping adults for the 21st century: Joining forces for action on skills and competences, 9–10 December 2013, with the UNESCO institute for lifelong learning). Literature reviews (e.g. <i>Improving basic skills in adulthood: Participation and Motivation</i>). Studies and reports (e.g. <i>An in-depth analysis of adult learning policies and their effectiveness in Europe</i>). “Best” or “good practices” compendia (e.g. <i>ERASMUS+: Good practices in the implementation of the European Agenda for Adult Learning, 2012–2016</i>) State of the art reports (e.g. <i>State of the Art Report on the Implementation of the European Agenda for Adult Learning</i>, by the european association for the education of adults). Design and management of multi-country surveys (e.g. the labor force survey and the european adult education survey managed by EUROSTAT or the education and training monitor) Final support to multi-country household surveys (e.g. the program for international assessment of adult competences managed by the OECD).

Policy coordination under the European Semester

The European Semester is a cycle of economic and fiscal policy coordination proposed by the European Commission, approved by the Council configuration for Economic and Financial Affairs (ECOFIN), and launched in January 2011. Framed as "a new framework for policy-coordination" at both horizontal and vertical levels, the European Semester "provide[s] a new socioeconomic governance architecture to co-ordinate national policies without transferring full sovereignty to the EU level" (Verdun and Zeitlin, 2018, p. 137). In extreme synthesis, the yearly cycle of the European Semester involves a preparatory phase (November-January), a phase of EU-level policy guidance (January-April), a country-specific phase (April-July), and an implementation phase (July-October). During the preparatory phase, EU institutions analyze the current situation of member states' budgetary and structural policies, as reported by the Commission. In the next phase (*policy guidance at EU level*), the Council studies the produced document and the Commission's recommendations, the Parliament expresses own opinions and, on these grounds, the European Council reaches an agreement on what policy directions should be pursued for the following year. During the country-specific phase, member states set their own objectives, policies, and plans, and these form the basis on which the Commission drafts Country-Specific Recommendations that are then subject to agreement, endorsement, and final adoption by the EU institutions. In 2021, this yearly cycle was adapted to allow member states to submit, in one integrated document, their national reform programs (as foreseen by the European Semester) together with their recovery and resilience plans to mitigate the economic and social impact of the COVID-19 pandemic.

Even before the outbreak of the COVID-19 pandemic and consequent EU mitigation strategy, scholars across multiple disciplines had begun to scrutinize the inherently supranational character of the European Semester through examinations of the political power and pivotal roles gained or lost by each EU institution (i.e. the Parliament, Council, and Commission) vs. member states, either in isolation or jointly (i.e. the European Council) (see Crum, 2018; Halleberg, et al., 2018; Maricut and Puetter, 2018; van der Veer and Haverland, 2018; Savage and Verdun, 2016; among others). The Commission emerged as the "core political driver" of the EU, with stronger powers vs. member states (Cisotta, 2013, p. 2–4, emphasis in original). A strand of the literature has focused on the (re)balancing of economic and social policy objectives within the EU (cf. Costamagna, 2013), questioning whether and to what extent the European Semester affected pre-existing relations between economic and social policies, including education and lifelong learning (cf. Stevenson, 2019a,b). Although empirical claims diverge, some point to social policy objectives being subordinated to economic ones (cf. Crespy and Menz, 2015a,b), with EU economic policy actors (the ECOFIN Council, among others) predominating in decision-making procedures (cf. de la Porte and Heins, 2014, 2015; Degryse et al., 2014) and education and other social reforms thus subordinated to economic imperatives (Stevenson et al., 2019). Alternative arguments, however, stress "a partial but progressive 'socialization' of the Semester" (Zeitlin and Vanhercke, 2018, p. 152). The European Semester, they suggest, is undergoing a progressive re-orientation to better balance economic and social policy objectives (including in education) and adopt a less hierarchical and more interactive decision-making process in which EU social and employment policy actors learn "to gain traction in 'evidence-based' deliberation with their economic policy counterparts" (Zeitlin and Vanhercke, 2018, p. 154), including on educational matters (cf. Stevenson et al., 2019). In short, many concur that the European Semester has produced a "shift of EU competences from the *soft* coordination of economic policies to a more binding and intrusive agenda-setting procedure" (Cisotta, 2013, p. 6, emphasis in original), "bringing together fiscal and macroeconomic coordination instruments with social and employment ones with the same cycle" (Louvais Fasois, 2017, p. 2). Under the European Semester's composite policy coordination process, therefore, both horizontal relations among EU institutions and EU-member states' vertical relations have been strengthened, including in education (Stevenson et al., 2019).

Conclusion

This article has outlined the EU as a *sui generis* political system with policy capacity in support of supranational integration and Europeanization and considered the implications of this for European education policy developments. Drawing on different theoretical perspectives, research on European education policy over the last two decades has acknowledged the supranational process supporting vertical integration triggered by the Lisbon Agenda and, lately, also the contribution to Europeanization made by the European Semester with its compound process of horizontal and vertical policy coordination. These findings have underlined that education (secondary, further, and higher education, as well as adult and vocational education) is not a stand-alone policy domain in the EU but part of “a complex interweaving” (St. John, 2021, p. 6) of policy domains increasingly built on the educationalization of social problems (Depaepe and Smeyers, 2008; Tröhler, 2016), a far more complex phenomenon if not an explicit strategy at the level of the EU (Sørensen et al., 2021; St. John and Murphy, 2019; Valiente et al., 2020). All this calls for stronger policy coordination across a large variety of actors with vested interests in education policy. This article has thus paid special attention to the need and capacity for EU policy coordination from a European governance perspective, thereby recognizing that both EU institutions and various policy actors matter for the formation of European education policy and the educationalization of public policy in the EU. Fittingly, major developments in European governance, encompassing the European Semester, address education (Milana et al., 2020a; Sørensen et al., 2021; Stevenson et al., 2020; Traianou and Jones, 2019), thus encouraging more research attention.

Introduction

National education systems and the World Trade Organization (WTO) might appear an odd pairing of institutions. After all, we teach and learn in one, and we regulate the global trading system in the other. However, this chapter will make the case that their relationship has emerged out of a growing view since the 1980s that education should be regarded as a service, that education systems can be construed as belonging to a services sector, that knowledge can be treated as a commodity, and that education services can be regulated through rules agreed to as part of the global trading system.

Understanding the history behind the World Trade Organization, the agreements that are invoked to bring education into the global regulatory system, and the mechanisms to manage disputes is important. This is because across many of the WTO member states, education services are now reported in international trade figures, while education activity is itself framed in very specific ways to articulate with the language of global trade. I explore these modalities, the politics of contestation that have accompanied efforts to bring education into trading relations and their regulations, along with new initiatives that have tried to side-step the challenges this contestation has presented with regards to the functioning of the WTO.

Early history of the WTO

The World Trade Organization (WTO) is a multilateral institution with 164 members as of 2021. It is also a relatively newer institution. The WTO was launched in 1995 and emerged out of the Uruguay Round of multilateral trade negotiations spanning the years 1986–1994. Up until this point it was the General Agreement on Tariffs and Trade (GATT) that coordinated global trade in the post WWII period. However, beginning in the 1980s there was a growing view particularly in the United States that services—financial, tourism, education, and health—should be included in the global trading rules. But while financial services and tourism have been commodified in systems of exchange, sectors like education and health in many parts of the world was considered a public service and not a consumer good.

The interest in transforming education into the services sector is because services make up a growing share of the economies of the developed world and is valued in the trillions of dollars. As the WTO notes:

While services currently account for over two-thirds of global production and employment, they represent no more than 25% of total trade, when measured on a balance-of-payments basis. This—seemingly modest—share should not be underestimated, however. Indeed, balance-of-payments statistics do not capture one of the modes of service supply defined in the GATS, which is the supply through commercial presence in another country (mode 3). Furthermore, even though services are increasingly traded in their own right, they also serve as crucial inputs into the production of goods and, consequently, when assessed in value-added terms, services account for about 50 percent of world trade

WTO website (2021a).

The GATT remained part of the WTO and was now joined by two new agreements: the General Agreement on Trade in Services (GATS), and the Trade Related Intellectual Property Rights (TRIPS). Both have important implications for education. In GATS all levels of education, from early years learning to adult and higher education, were specified as up for negotiation to be included in education services sector negotiations with Member States. Where knowledge took a proprietary form, it was increasingly regarded as intellectual property and included in TRIPS. This refers to music, books, research papers in journals, and so on.

The WTO's mandate was to "... formalize, deepen and widen an international system of trade regulation. It was also to bring greater coherence in global policymaking by drawing together the work of the WTO with that of the IMF, the WB as well as to

develop relations with other bodies” (Wilkinson, 2002: 129). Yet there were problems in defining services using the language of trade in goods. As Winham points out:

... services are processes, defining them is difficult, unless a strict functional definition is employed. ... The tasks for the negotiators at the Uruguay Round were to incorporate GATT principles of transparency, national treatment and reciprocity, as well as newer principles such as market access, into areas of trade that were conceptually dissimilar from trade in goods

Winham (2005: 101).

The result was a services agreement that was “... not yet complete, not terribly user friendly, with a complex geometry and *ala carte* obligations set against the backdrop of near universal coverage and sovereign immunity in liberalization matters” (Sauve, 2002: 3).

What does GATS involve?

Members who joined the WTO were required to opt into a series of legally-binding rules and a built-in agenda to engage in on-going negotiations leading to progressive liberalization. And while all sectors of education were included in GATS, it was then up to the negotiators as to which modes and sectors might be listed for agreement (Verger and Robertson, 2012). This is called a “positive list” approach.

GATS has three components. The first component is a framework of rules that lays down the general obligations governing trade in services, much as it does with the GATT. It lays out the basic elements such as: (i) *most-favored nation*—treating other nations equally so that one nation is not favored over another though some exemptions will apply; (ii) *national treatment*—treating foreigners and locals equally especially in the context of those operating within the boundaries of the country; (iii) *market access*—eliminating or reducing various kinds of tariffs that limit the possibility for some entities to get access to the market; and (iv) *transparency* of all domestic regulations at all levels of government and including also non-governmental bodies exercising governmental power or authority. This last element is important to make visible the various kinds of regulations which might act as a barrier to a provider of services regarding entry to the market (Robertson et al., 2002).

In a second component there are very detailed annexes on specific services sectors like education. A third component consists of “schedules of commitments” detailing the liberalization commitments of each WTO member.

The GATS distinguishes between “four modes of supply” through which services can be traded (see Box 1). These are: Mode 1: cross border supply; Mode 2: consumption abroad; Mode 3: commercial presence; and Mode 4: movement of natural persons. These are odd sounding categories from the point of view of education—largely as they borrow from the language of the GATT. Briefly, when applied to education, cross border supply refers to services that are delivered by a supplier in another country so that it moves across a national border—such as distance education. Consumption abroad refers to students from one country paying fees to study in another country. Commercial presence refers to an education provider, such as a university based in one country, establishing itself in another country and supplying education—such as a branch campus. Movement of natural persons refers to academics and researchers who are providing a service when they are working in another country on a temporary basis.

An exemption is only granted to a services sector under GATS Article 1.3; when it is supplied “... in the exercise of governmental authority” (Art 1.3(b)), and is “supplied neither on a commercial basis nor in competition with one or more service providers” (Art. 1.3 (c)). Governmental authority is interpreted in a narrow sense (WTO, 2021; see also Krajewski, 2016: 2–3). However, the idea of

Box 1 General Agreement on Trade in Services -modes of supply, definition and example

Mode of supply	Definition	Example
Mode 1 Cross border supply	Supply of a service from one MS territory to another	Distance education Education software
Mode 2 Consumption abroad	Supply of a service in the territory of one MS to the service consumer	Fee paying international student studying abroad
Mode 3 Commercial presence	Supply of a service by a service supplier in the territory of another MS	Branch campus Language training company
Mode 4 Movement of natural persons	Supply of a service by a service supplier of one MS through presence of natural persons	Professor, teachers, researchers working abroad on a temporary basis

governmental authority is only applicable to core sovereign functions and not applicable where there is any remuneration, or where there is evidence of competition, meaning there are one or more service suppliers. Were a commitment to be made, a reversal (such as renationalizing) would be difficult in that other WTO Members would have the right to refuse such a reversal, demand a similar commitment in another sector, demand compensation for the reversal, or ultimately to reject the reversal of the commitment. This has happened where a country wanted to make a reversal to health commitments made by a previous government that had liberalized and privatized their economy (see [Robertson et al., 2017](#)).

Education—from public services to a tradeable services sector

Public services in many countries around the globe have been encouraged to implement market mechanisms, such as competition and choice (quasi-markets), or because they are existing markets made up of buyers (families/institutions/countries) and of sellers (firms/countries) ([Verger et al., 2016](#)). Most education systems are mixed systems, with a private sector playing a role (even if their education offer—such as the type of degree—differs) ([Robertson et al., 2002](#)). Furthermore, fees exist even in public schools. Education systems were therefore unlikely to have qualified for the status of “governmental authority” flagged under GATS Article 1.3 at the time that GATS was launched in 1995. This is even less likely today given the extent to which education systems—as public services—have been unraveled and now include many non-state actors supplying a wide range of education activities ([Robertson et al., 2012](#); [Verger et al., 2016](#)).

[Kelsey \(2008: 234\)](#) argues that including education as a public service or public utility was off the radar during the Uruguay Round, largely because education was widely understood by governments and citizens to be a public good. However, this norm was challenged in the 1990s when (i) trade departments saw the potential value of the sector, (ii) entrepreneurs saw new opportunities opening up as education became more and more central to developing competitive economies, and (iii) families were under growing pressure to buy additional education services and other opportunities to ensure social mobility ([Brown et al., 2011](#)).

Despite efforts to list education commitments across the WTO members beginning in 1995, the GATS negotiations proved to be hugely controversial. Each annual meeting of the WTO was marked by protest. The iconic “Battle in Seattle” in 1999 was hugely resonant of the times. Between meetings, campaigners organized and promoted education as a human right, and not a commodity, though some countries did make education commitments. [Verger \(2010\)](#) shows that the extent of commitments was quite limited, and the density of these commitments quite varied. Those opposing the inclusion of education in GATS enrolled a competing narrative; of education was a human right and entitlement, as recognized in international instruments. The most prominent here was the International Declaration of Human Rights (1948), and the Convention of the Human Rights of the Child (1959).

In a specially commissioned report on GATS, the Special Rapporteur for Education, Katerina Tomasevski, pointed out that the “... rapid development of international trade law necessitated a decisive reaffirmation of education as a human right” (2001: 5). This led her to observe:

... the liberalization of trade in services, without adequate government regulation and proper assessment of its affects, can have undesirable effects. Different service sectors require different policies and time frames for liberalization and some areas are better left under governmental authority (p. 20) ... While the WTO Agreements provide a legal framework for the economic aspects of the liberalisation of trade, they focus on commercial objectives. The norms and standards of human rights provide the means of providing a legal framework for the social dimensions of human rights ... A human rights approach to trade liberalisation emphasizes the role of the State, not only as negotiator of trade rules and setter of trade policy, but also as duty bearer for human rights

[Tomasevski \(2001: 10\).](#)

In her Report, the Rapporteur pointed to ways in which GATS would exaggerate social inequalities in education. For example, in Mode 1 (cross border supply) those advantaged by virtual suppliers were those who had the necessary infrastructures, such as the Internet, to access education. Mode 2 (consumption abroad) could lead to the introduction of a dual market of fees and would exaggerate inequalities if governments did not have a way of ensuring cross subsidization. Under Mode 3 (commercial presence), if user fees were introduced, then education would likely become more expensive, and it would not always be easy to regulate foreign suppliers. Finally, under Mode 4 (presence of natural persons), while it might enable knowledge transfer and remittances to be returned to the sending country, it could also lead to brain drain. Locking countries into their schedule of commitments, and penalizing them for seeking reversals, revealed the tension between commercial interests and societal interests. In making this point the Rapporteur observed:

From a commercial perspective, holding countries to their commitments to liberalise is important to ensure transparency and predictability in international trade and the payment of compensation is a legitimate commercial response to the settlement of disputes. From a human rights perspective, however, the focus is less on predictability and more on the need for flexibility to modify or withdraw commitments to liberalise services where experience demonstrates that a commitment constrains or limits the enjoyment of human rights. The need for flexibility is particularly relevant for developing countries given that they are in a dynamic process of building infrastructures. ... Moreover, while compensation to affected parties might be appropriate in some cases upon withdrawal of commitments, a human rights approach would question whether states should be sanctioned for taking action to protect human rights

[Tomasevski \(2001: 28\).](#)

Other influential commentators, including academic activist Jane Kelsey (2003, 2008), argued that GATS would have important consequences for the marginalized and poorer sectors of societies, including indigenous peoples, women, and girls, as GATS rules did not provide for any recognition of indigenous rights or cultural identity. And Frederiksen (2004) pointed out, the irony was that if a child does not get the education he/she is entitled to according to the Convention of the Human Rights of the Child (para 28 and 29), there is no way to force that government to meet its commitments. However, if a company trading in education services loses its right to trade in a particular country, that country where the company is based will have, according to the WTO rules, the right to compensation. Rules concerning trade seem to be much stronger in international law than rules concerning human rights. Similar concerns were aired, and statements issued, by the higher education sector. These concerns, along with growing disquiet among many developed and developing countries as to what free trade really meant for them, resulted in WTO negotiations grinding to a halt by 2005 (Kelsey, 2008).

In sum the inclusion of education as a services sector in the WTO's General Agreement on Trade in Services in 1996 marked a radical shift in understanding as to the purpose of education in society. From being a means of socializing individuals into a society as both economic and political citizens, GATS reframed education as a global services sector to be governed through global rules of trade. And while some countries had committed aspects of education sectors, well organized global protests around including the services sectors more generally resulted in limited progress by the GATS negotiators. This, if course, should not be read off as a success for the protestors. What emerged out of this impasse was that trade negotiators took a bilateral rather than a multilateral route.

Forum shifting—Regional Trade Agreements

Following the challenges facing the GATS negotiations, free trade advocates and corporations shifted their efforts to new forums to keep advancing the “trade” agenda. Forum shifting took a number of forms. Using the UK as a lens (and mindful that the UK was still in the European Union and the trade negotiators were in the European Commission's DG for Trade and Industry), we can see multiple movements and scales of activity.

At the national level, interested education services providers approached nationally located regulatory bodies to make claims to enter the sector (Robertson and Komljenovic, 2016). At the regional level, agreements like European Union's Directive on Services were advanced and finally agreed to in 2006. At the bilateral level, a significant number of Bilateral and Preferential Trading Agreements were advanced (Horn et al., 2010). In combination, these different forums to advance liberalization moved the trade agenda forward.

Here I will focus specifically on what are called Preferential or Regional Trade Agreements (RTAs). Horn et al. (2010) show that RTAs grew significantly in number when the World Trade Organization was launched—from 50 in 1995 to around 349 in 2021 (WTO, 2021b). A large part of this expansion involved agreements where either the US or the EC are at the center of the partnership. This has led some to argue that though the EC and US account for no more than 40% of world GDP and world trade, they account for 80% of the rules that regulate the functioning of world markets, and thus can be regarded as “regulators of the world” (Horn, 2010).

However, these newer RTAs are different from those formed prior to 1995. The earlier group focused on trade in goods and the reduction of tariff rates and quotas, while the post-1995 RTAs now included the regulatory aspects of services, and trade-related intellectual property (Sauvé, 2014). Commentators argue what is notable about this new generation of RTAs is that they tended to go further in their coverage of regulatory issues than under the WTO, and now include provisions and mechanisms such as: “... investment protection, competition policy, labor standards and protection of the environment” (see Horn et al., 2010: 1566). In a 2014 Trade and Development Report, the United Nations Conference on Trade and Development (UNCTAD) signaled concern over the steady erosion of national “policy space” as a result of RTAs “... some of which contain provisions that are more stringent than those covered by the multilateral trade regime, or they include additional provisions that go beyond those of the current multilateral trade agreements” (UNCTAD, 2014a: 19). They go on:

Provisions in RTA have become ever more comprehensive and many of them include rules that limit the options available in the design and implementation of comprehensive national development strategies. Even though these agreements remain the product of (often protracted) negotiations and bargaining between sovereign States, there is a growing sense that, due to the larger number of economic and social issues they cover, the discussions often lack transparency and the coordination—including amongst all potentially interested government ministries

UNCTAD (2014a: 19).

UNCTAD (2014b) also shows that there has been a steady rise in investor disputes cases; by 2021 UNCTAD (2020) reported this figure had gone over 1000 cases. UNCTAD also notes that the ad-hoc tribunals established to adjudicate disputes tend to display a pro-investor bias, and that there is a lack of transparency around the arbitration process. Research by van Harten (2012: 6) confirms this. Drawing on empirical evidence, he shows that there is systematic bias in the arbitration resolutions in favor of the major Western capital-exporting states. The secretive nature of the arbitration process, and the lack of any requirement to consider precedent, allows plenty of scope for creative adjudications.

The sharp rise in contentious arbitrations is interpreted as the result of companies learning to exploit ISDS clauses, going as far as buying firms in jurisdictions where they apply simply to gain access to them. Shopping around for firms in jurisdictions where they can make a claim is not just a case of “forum shopping”—a term used to describe firms who look around for agreements that will give them most “return” regarding potential investor pay-outs—but also of “place hopping”; that is, looking for those places, or jurisdictions, that enable them to launch a more lucrative claim—much as tax havens and states with a low taxation floors have been used. This uneven terrain is the result of different degrees of economic and political liberalization in countries. Most importantly, ISDS gives exclusive rights to foreign investors—rights not available to domestic investors or citizens. Foreign investors are not even obliged to exhaust the domestic legal system before turning to ISDS to make a claim.

The Trade in Services Agreement (TISA)

The origins of the Trade in Services Agreement (TISA) come from frustrations by a selective number of WTO members in the lack of progress by the WTO in negotiations including education. The TISA is thus an ad hoc coalition of WTO member countries willing to advance services negotiations outside of the WTO formal structures. These negotiations were initiated by the US and Australia (Peng, 2013: 614); both countries who have a huge stake in the global education services market. Calling themselves the “Really Good Friends of Services,” the parties to TISA are negotiating services independently of the GATS/WTO though they argue that they hope to inform them (Peng, 2013: 613). More broadly, the “Really Good Friends of Services” are predominantly OECD countries. Historically, the inclusion of services in the WTO was a concession for developing countries (Gould, 2014: 9) and Gould argues that the “... TISA negotiations are essentially a replay of the negotiations that produced the GATS, but this time without the delegations [developing countries] present in the room that might have pushed back against the more extreme demands of the transnational services lobby” (Gould, 2014: 9).

The negotiations formally began in March 2013, and a basic text was agreed by September of that year indicating which service markets participants were prepared to open, and to what extent. By August 2016 there were 23 negotiating parties: Australia, Canada, Chile, Chinese Taipei (Taiwan), Colombia, the EU (representing its 28 member states), Hong Kong China, Japan, South Korea, Mexico, New Zealand, Norway, Pakistan, Switzerland, Turkey, the United State. Costa Rica, Israel, Iceland, Panama, Peru and Mauritius. By November 2016, there had been 21 rounds of negotiation (EC, 2022). Sauve (2014: 7) notes that TISA was being advanced without the formal ascent of the broader WTO membership, negotiations were taking place in Geneva but outside of the perimeter of the WTO, it was at arm’s length to the WTO Secretariat, and the RGFS do not allow observers in, including the WTO.

The ultimate outcome in Sauve’s (2014: 5) view, is that TISA is likely to face the very same fate of the services negotiations under the Uruguay and Doha Rounds; a stand-off between the developed and developing world. Given the secrecy surrounding the negotiation of the TISA, the final outcome regarding how education will be included remains uncertain. The “negative list” principle for national treatment adopted in TISA means in principle, no service is excluded. As under the WTO/GATS, only those services that are services supplied in the exercise of “governmental authority”—see Article 1.3(b) (WTO, 1999)—are exempted.

The exclusion of such countries was broadly political. There was a widely shared view that the EU and US were attempting to create a set of rules for the global economy that work in their specific interests (cf. Bhagwati et al., 2015) regarding the share of global trade. Yet it is clear China (outside the TISA group) has become a major force in the global economy—though not a major exporter of education services. The USA continues to dominate global trade figures, while Germany has moved from second to third place as the powerhouse for the EU (WTO, 2021). Overall, however, TISA can be viewed as largely a failed project. Since 2016 there has been very little activity suggesting that like the WTO negotiations this project has stalled.

Trade related aspects of intellectual property rights

TRIPS was the second major agreement launched at the time of the WTO’s inception alongside GATS. TRIPS has important implications for education systems as producers and users of knowledge, and particularly so following the extent to which knowledge is being digitized.

A key claim of contemporary knowledge-economy policy agendas is that knowledge is Intellectual Property (IP) protected through law (e.g., patent, trademark, and copyright law). New digitally mediated innovations have enabled the creation of new products and services, with data and information now a form of currency (Curtis, 2012). Information is an important building block for new products and services around the creation, storage, analysis, sharing and innovative recombining of data and information. For instance, large student satisfaction surveys about their university experience are carried out by companies like i-graduate or the Princeton Review; these firms gather data and sell information to students and universities regarding where best to study. They also sell information back to the sector to enable institutions to see how their competitors are doing.

Curtis (2012) argues there have been rapid changes in intellectual property and policy due to the intersection between international trade and the numerous international trade agreements that have been bought into force more recently. Driving this dynamic are the developed countries who export intellectual property rights (music, writing, patents, trademarks, and so on) and who pressure other countries to change or create intellectual property rights–related policies and regulatory instruments to accommodate the exporter’s interests. As a result, have been major changes in intellectual property (IP), law and policy over the past 20 years. Realizing the terms of conditions for “rents” depends on legal infrastructures that bind producers and users into a contractual relationship.

Yet as [Curtis \(2012: 8–9\)](#) points out, there is a tension between the rights of *creators* and the rights of *users*. Lawyers are largely concerned with the rights of creators, turning those rights into intellectual property rights. Economic policymakers are more interested in determining the cost-benefit ratio between the rights of creators and the rights of users in terms of innovation, economic growth and productivity. This is because in particular circumstances, limiting access to products and services through putting a price on them, in turn slows down innovation. Similarly, copyright protections aimed at creators can limit creativity in that it makes it difficult for some texts to be easily accessed in sufficient volume by users. How closed and how open systems of regulation are to ensure that the creators of things (goods, services, artifacts, performances) get some financial return on their labor, is pitched against the costs or not for users.

Since the mid-1990s, global trade and intellectual property rules have come together with a view to regulating them through the World Trade Organization's Trade-Related Aspects of Intellectual Property Rights (TRIPS) (1996). TRIPS was later followed by the inclusion of IP standards and obligations in many regional and bilateral Free Trade Agreements trade agreements beginning in 2000.

Though many countries have been developing their own infrastructures, the United States dominates the digital economy and digital trade; that is, commerce in products and services delivered using the Internet in cross border information flows ([Aaronson, 2016](#)). The United States is also behind efforts to develop trade rules to govern cross border flows. Ranked by market capitalization, the United States is home to eleven of the fifteen largest internet-based businesses, including Apple, Google, Facebook, Amazon, LinkedIn and Twitter. China is home to four; Alibaba, Tencent, Baidu and JD.com ([Aaronson, 2016: 7](#)). No companies from Brazil, Canada, the EU28, India, Japan, or Korea are listed among the top fifteen digital corporations.

The stakes of who regulates the Internet has increased since 2008 following the global financial crisis, with governments around the world viewing the Internet and digital technologies as an economic savior. The global pandemic as a result of Covid19 in 2020 will have escalated this given the movement of education delivery to online learning. However, countries also worry about the dominance of the United States in issues of competition, human rights, and infrastructural policies. Education sectors include individuals and organizations (e.g., administrators, teachers, researchers, students, test and textbook producers, performance artists) who are both creators and users of intellectual property. As creators, their outputs may or may not be owned by the institutions in which they work. They may well sign away their rights as creators to publishers for a fee, or a share of the royalties.

More broadly, the global education publishing market is massive, and accounts for 15% of global media and entertainment ([Wischenbart, 2016: 4](#)) estimated to be worth over US\$1 trillion. The total world market value of publishing education in 2016 was estimated to around €95.6 billion and growing ([Wischenbart, 2016: 2](#)), with markets in the USA and China taking the major share. Figures reveal that the Chinese publishing industry is expected to grow further as a result of domestic consumption within China, and as a result of aspirations for a better education among the middle classes in urban regions ([Wischenbart, 2016: 3](#)). Recently e-books have revived a shaky book market, particularly in the US and the UK, both with strong export profiles. The global pandemic in 2020/21 has also created a major boost for electronic books given that access to physical books was made difficult if not impossible in some countries.

As users of digitally based intellectual property, many education providers have invested in virtual learning platforms to manage their teaching and learning interfaces. This applies to physically located institutions, as well as purely on-line providers. Massive Open Online Courses (MOOCs), which emerged around 2010, now sit on platforms enabling learners from around the world to connect to bespoke courses offered by universities, sometimes with a small fee collected by the MOOC platform owners from the students who enroll in exchange for a certificate of participation. Start-up companies like LinkedIn have been purchased by the technology giants like Microsoft, not only connect data on the learning and employment profiles of individuals but use this information to create new services around recruitment ([Komljenovic, 2019](#)). Many education institutions also use Google's Gmail system, as well as other services, such as DropBox. The Cloud is also routinely used to store education-related data from libraries of papers to large datasets. Facebook is used by education institutions to bring groups of learners and other study groups together, as well as being a means of keeping in touch with alumni. However, these global companies do not reach into each country; China for instance places limits on the operation of digital firms inside its borders—such as Facebook and YouTube.

Conclusions

I began by suggesting that educators are likely to look askance at the pairing of education systems with the World Trade Organization in that what is implied is that education might be part of the global trading system. Yet it is evident that there has been an ongoing project since the 1980s to bring services into the regulatory systems that operate globally, and that education should be treated as sector to be included in the ongoing negotiations. The WTO's two agreements, GATS and TRIPS are particularly relevant to education. It is also clear that WTO Members have been rather unwilling to negotiate over education, and the level of commitment has been quite low. In essence what the developed countries were seeking were ways of entering another country's education sectors either through providing education services, ensuring education professionals could operate on a temporary basis in another country, or it can provide services—such as on-line learning—across national borders. The critical thing was that foreign providers would be treated the same as local's which could also include eligibility for local provisions, such as access to state funded student loans.

The WTO has nevertheless not managed to get a high level of buy-in regarding commitments to open up. This is not to say that of liberalization of education has been stopped in its tracks. Far from it. Other means of liberalizing education system to open them to

a wide array of non-state actors headquartered in another country have been pursued, such as the Preferential or Regional Trade Agreements, which commentators argue have been even more aggressive than the WTO disciplines, or simply letting the logic of the market shape the dynamics of the sector. Where the WTO rules will matter if education has been committed is how to wrest education back from the logics of profit and market expansion were other politics to emerge which challenged this framing.

Introduction

The United Nations Educational, Scientific and Cultural Organization (UNESCO), is an agency of the United Nations (UN). As a key UN agency and an International Organization (IO) for education, science and culture, UNESCO has worked in a wide variety of areas including protecting heritage, strengthening biodiversity (especially ocean sciences), fostering freedom of expression, preventing violent extremism, and sustainable development.

UNESCO's stated mandate is to establish the “intellectual and moral solidarity” of humanity to prevent war and build peace.¹ One of the key activities that UNESCO aligns with this mandate is to “foster the free flow of ideas and knowledge sharing”.² UNESCO realizes this vision through three sets of interrelated activities:

- i. Knowledge generation and dissemination through data collection, reports, development of curricula, handbooks, guides and manuals. This function is not different from other IOs, such as the World Bank (WB), which positions itself as a knowledge bank.
- ii. Coordination, evaluation and monitoring of the various international commitments or goals. This is often referred to as the accountability function in education.
- iii. Advocacy through conferences, meetings and policy briefs, referred to by the staff as its “convening power”.³

It has its headquarters, nine education institutions, national and regional offices, networks and institutes across the globe that support these functions in varied ways, as discussed below.

UNESCO's website⁴ identifies its two key priorities which are Africa and gender equality. UNESCO has a presence in all 54 countries of Africa. Its Africa programming concentrates on six flagship areas that include: (1) education systems for sustainable development; (2) science for sustainable resource management and disaster risk reduction; (3) building on culture for sustainable development and peace; (4) freedom of expression and media development; (5) peace and non-violence; and (6) science, technology and innovation for sustainable development.⁵ With regards to gender equality, UNESCO has adopted a three-pronged approach of: (1) integrating or mainstreaming gender across its programming; (2) developing specific programmes on gender; and (3) monitoring and evaluating the progress on gender equality goals (UNESCO, 2019). UNESCO's Gender Equality Action Plan 2014–2021 (revised in 2019) defines gender equality as a human right and lays down a time-bound plan of action for achieving its targets. Much of the organization's programming and publications, especially in its first three decades, have been driven by these priorities.

UNESCO is located within a range of diverse IOs comprising various donors/bilateral agencies, specialized agencies of the UN, such as UNICEF and UNDP, and Bretton Woods institutions such as the World Bank (WB), the International Monetary Fund (IMF), international non-government organizations (INGOs), alliances and networks, such as Global Alliance for Vaccine and Immunization (GAVI), the Global Campaign for Education (GCE), and philanthropic foundations such as the Bill and Melinda Gates Foundation. In this complex and diverse set of institutions, UNESCO, as this paper argues, has sought to ensure its hegemony over the global education agenda competing for space with, for example, the WB and the UN Children's Fund (UNICEF) whose education vision and orientations differ from those of UNESCO. What sets UNESCO apart from most other IOs and UN agencies is that it is governed by its member states. This means that each country that is a member has an equal say, a rare example of democratic participation in policy making in the UN system.

In this context, this paper examines the functioning of UNESCO as part of the international global architecture for development and as part of the field of global policy, in general, and education policy, in particular. We pay particular attention in this paper to the intellectual evolution and trajectory of UNESCO's education ideas and how it constitutes its space in the multilateral global field and the tension and contradictions that result from this. In particular, we seek to provide an ideational genesis of the education policy and programmes that populate UNESCO's work showing how its vision shifts and alters shape within specific conjunctural and spatial moments and periods as a result of its interactions with its own members and in relation to other IOs.

This paper draws on a general review of the UNESCO Digital Library⁶ over nearly eight decades of its existence. This library contains a large volume of publications about education. It has directly produced 127,381 publications and has sponsored 2659 publications, most in the English language. These publications include many types of documents predominantly program and meeting documents (77,185), books (12,821) and articles (17,988). The Digital Library classifies conference material (47,305) as the most frequently published type of UNESCO and UNESCO-sponsored publications. These publications are cataloged under a large variety of topics with the most prominent during 2000–2021 being higher education (8556). Geographic regions covered by these publications include Latin America (5506) and Africa (5016) as the two regions with the highest number of publications. Navigating the Digital Library is challenging because of the volume of publications and also because the topics that are cataloged are not mutually exclusive. Analysis indicates that these publications could be more coherent if they were classified by tracking UNESCO's intellectual history as we do below using particular publications to explain UNESCO's vision of education over time.

The paper is organized in five sections including this first introductory section. The second section positions UNESCO's educational agenda in the larger context of its emergence, its centrality in UNESCO's programming, and vis-à-vis other IOs. The third section traces the intellectual trajectory of UNESCO's educational agenda around certain key phases in its history. The fourth section builds on this tracking, and engages with two major intellectual reports of UNESCO to show how significant shifts in these reports are reflected in the practice of education. The fifth section juxtaposes the changes in the educational discourse with the flash points in UNESCO's multilateral politics. It also investigates how UNESCO's educational agenda is positioned as a UN agency and among the many IOs in the sector.

Positioning UNESCO's educational agenda: an overview

UNESCO originated from the League of Nations and the Committee on Intellectual Co-operation in 1922. It emerged from inter-governmental cooperation for the rebuilding of education, science, and culture in a post-World War I world. In particular, UNESCO was an outcome of the Conference of Ministers of Education of the Allied Governments and the French National Committee (CAME) that was first convened in London on November 16, 1942, and continued to meet until 1945. The first meeting was organized by the Board of Education of the United Kingdom (UK) and the British Council, with the Ministers of Education of Belgium, Czechoslovakia, France, Greece, the Netherlands, Norway, Poland, and Yugoslavia. The intent was to initiate dialog on the concerns collectively experienced by these countries, particularly around education, both during wartime and afterward (De Capello, 1970). Based on the deliberations at CAME, the governments of France and the UK, called for a United Nations conference for the establishment of an International Organization for Education and Culture, during November 1–16, 1945, in London. This conference resulted in the drafting and adoption of UNESCO's Constitution. The preamble of the Constitution states, "since wars begin in the minds of men [sic], it is in the minds of men [sic] that the defenses of peace must be constructed".⁷ UNESCO's mission is "to build peace through international cooperation in Education, the Sciences and Culture".⁸ Niebuhr (1950:4) divides UNESCO's initial functions into three categories: (a) bridging the gaps in the free flow of ideas in the world community; (b) bringing the assistance of the developed nations to bear upon the educational problems of the developing nations; and (c) overcoming cultural and inter-governmental misunderstandings.

Given the emphasis on education at its pre-conceptualization stage, UNESCO's vision, discourse and programming have prioritized education. This makes UNESCO a unique agency of the UN in the education sector compared to other specialized agencies, for instance, the WB Group and the IMF that added education as an addendum to their primary agenda of global economic growth. It is also different from UN programmes and funds that have overlaps with the education sector, such as the UN Development

⁶<https://unesdoc.unesco.org/library> (Accessed on 25.11.2021).

⁷<https://www.unesco.org/en/introducing-unesco> (Accessed on 24.11.2021).

⁸<https://www.unesco.org/en/introducing-unesco> (Accessed on 24.11.2021).

Program (UNDP) and the UN International Children's Emergency Fund (UNICEF), in terms of the centrality, aims and scope of its educational agenda.

UNESCO's institutional architecture has eight Category 1 institutes or specialized departments that focus on education, as compared to one each in science and statistics. These eight education institutes include:

- The International Bureau of Education (IBE)
- The International Institute for Education Planning (IIEP)
- The UNESCO Institute for Lifelong Learning (UIL)
- The Institute for Information Technologies in Education (IITE)
- The International Institute for Higher Education in Latin American and the Caribbean (IESALC)
- The International Institute for Capacity Building in Africa (IICBA)
- The Mahatma Gandhi Institute of Education for Peace and Sustainable Development (MGIEP)
- The UNESCO Institute for Statistics (UIS)

Out of the program implementation arm of UNESCO's 81 Category 2 Centers, 15 have a dedicated focus on education. According to UNESCO (2021b:8), education has the highest percentage of staff (45%) in the program sectors, followed by the natural sciences (24%) and culture (16%). It currently has 400 staff members of which 120 work at the headquarters in Paris, France, while the rest work in education programmes in its 53 field offices. UNESCO is also the only UN agency that has a global network of 199 National Commissions set up by the member states to support cooperation on different areas of work, including education. UNESCO also launched the UNTWIN/UNESCO Chairs Program in 1992 to develop an international network for knowledge generation and sharing by creating Chairs in 850 institutions in 117 countries. The Chairs are seen by UNESCO as bridges between policy development, research and global inter-cultural understanding. UNESCO is financed by compulsory contributions of the member states with Japan, China and Germany as the top three contributors.⁹

Compared to other IOs that work in the education sector, there are also other distinctive structural and organizational elements of UNESCO that stem from its foundational aim of rebuilding the post-war world. Historically, as an intergovernmental multilateral organization, UNESCO's focus has involved conventions, agreements, recommendations, and declarations, at an intergovernmental level. It was not conceived as a funding organization or as a forum for delivering the agenda of alliances of developed countries. In the context of its multilateral origins, UNESCO's democratic foundational structure has three principal organs: (a) the General Conference which is the principal policy decision making forum of UNESCO with representatives from all the member countries; (b) the Executive Board elected by the General Conference for supervising the agreed upon mandates which, until 1993, comprised elected individuals rather than nominees from states; and (c) the Secretariat headed by the Director General. The decision making in the General Conference and the Executive Board is based on discussion and debate over each new program proposal where each of the member country representatives has the right to express concerns or objections. Each member country of UNESCO has the right to vote in the General Conference and in the election of the Executive Board that has representation from different electoral groups (Hite and Bray, 2010:688–693). This is in contrast to some other UN agencies and IOs,¹⁰ for example, the WB, where the voting power privileges the developed nations based on their financial strength.

The democratic structure of UNESCO not only shapes its education policy, but also frames its politics and functional challenges. From 20 members in 1946, currently, UNESCO has 193 member countries and 11 associate members.¹¹ The membership fluctuates as an outcome of multilateral politics between the member nations (as discussed below), significant events in the world history, and international relations (such as the collapse of the Soviet Union). As more states join UNESCO, particularly the developing countries, its focus has shifted toward education in the Global South. This shift has caused North-South tensions that have directed its future.

As a UN agency, since 2001, UNESCO has participated in the observance of UN International Decades that are relevant to its institutional mandate and has assumed the role of a coordinating and monitoring agency or a "convening body". The UN decades that UNESCO has observed are as follows:

- 2001–2010: International Decade for a Culture of Peace and Non-Violence for the Children of the World
- 2003–2012: United Nations Literacy Decade
- 2005–2014: Second International Decade of the World's Indigenous People
- 2005–2015: International Decade for Action, "Water for Life"
- 2010–2020: United Nations Decade for Deserts and the Fight against Desertification
- 2011–2020: United Nations Decade on Biodiversity
- 2013–2022: International Decade for the Rapprochement of Cultures
- 2014–2024: United Nations Decade of Sustainable Energy for All
- 2015–2030: United Nations Decade of Education for Sustainable Development
- 2015–2024: International Decade for People of African Descent
- 2021–2030: Decade of Ocean Science for Sustainable Development

⁹<https://en.unesco.org/themes/education/about-us> (Accessed on 24.11.2021).

¹⁰Personal communication with official to one of the authors.

¹¹<https://en.unesco.org/countries> (Accessed on 25.11.2021).

- 2022–2032: Indigenous Languages Decade

These UN International Decades have shaped UNESCO's education sector even though they have not always reflected its intellectual interests in areas, such as higher education and teacher education, which are key to its policy, programming, and knowledge functions.

UNESCO's intellectual trajectories

This section describes the UNESCO's educational history by tracking significant shifts over time (see section [Negotiating the politics of multilateralism and global education governance](#)). Particular attention is paid to how UNESCO's multilateral politics have impacted its knowledge production and its position vis-a-vis other IOs in an increasingly competitive arena of global education governance.

UNESCO is the only IO that has simultaneously worked in non-formal as well as formal education that includes adult education through literacy campaigns, school education, tertiary or higher education, teacher education and vocational education. Over time, the program priorities have shifted toward primary education, even though higher education is still included in its agenda ([Mundy and Madden, 2009](#)). This section discusses UNESCO's engagement with universal and non-formal education including higher education.¹²

UNESCO's vision of education includes a human rights perspective. At its founding, UNESCO intended its educational programming to contribute to global peace building and development even though its work in conflict and conflict affected contexts emerges much later in its policy, programming and knowledge production. UNESCO's education vision is based on four phases.¹³ The first phase is a focus on fundamental education orientated toward literacy. The second phase focuses on the period from the Jomtien declaration to the global education agendas of Education for All (EFA) and Millennium Development Goals (MDGs.) The third is the Dakar EFA and MDG phase that includes the dual millennium global education goals and the fourth is a discussion of the SDG, COVID-19 and lifelong learning.

Education for democratic redevelopment—the “education fundamental” approach

The first phase of UNESCO's intellectual agenda,¹⁴ from its inception to the 1970s, prioritized education as a fundamental human right and placed “education for all” centrally in its constitution ([UNESCO, 1945:5](#)). It launched the “Fundamental Education” program soon after its inception in 1947 that, while including all levels of education, emphasized adult education that was included in Article 26 of the UN's 1948 Universal Declaration of Human Rights. UNESCO's First International Conference on Adult Education (CONFITEA I) in 1949, defined adult education as “the true spirit of democracy and the true spirit of humanity” ([Elfert, 2019:539](#)). This included eliminating racial and totalitarian propaganda through re-education ([Elfert, 2019](#)).

UNESCO's initial approach to literacy has been critiqued in the literature from a post-colonial perspective as it adopted Western notions of education. For instance, [Wagner \(2013:21\)](#) states that

... UNESCO often found itself adopting the exhortatory approach of illiteracy ‘eradication’ (treating illiteracy as a disease), the ‘battle’ against illiteracy, and the comparison of literacy to a ‘light bulb’, in that a person is in the dark until liberated into the ‘light’ of literacy.

Despite this, UNESCO's published documents consistently demonstrate a commitment to a human rights approach in which adult literacy is a core founding priority.

By the 1950s, as UNESCO's membership grew, so did new multilateral priorities that included commitment to “functional literacy” ([Jones, 1988](#); [Mundy, 1999](#); [Limage, 2007](#); [Elfert, 2019](#)) that focused on the formal education system and redefined its conception of literacy. This shift is evident in the Experimental World Literacy Program (EWLP) (co-funded by the WB and the UNDP) from 1966 until the mid-70s which tested and demonstrated “the economic and social returns of literacy” ([UNESCO, 1966:2](#)):

Rather than an end in itself, literacy should be regarded as a way of preparing man [sic] for a social, civic and economic role that goes far beyond the limits of rudimentary literacy training consisting merely in the teaching of reading and writing ... reading and writing should lead not only to elementary general knowledge but to training for work, increased productivity, a greater participation in civil life and a better understanding of the surrounding world, and should ultimately open the way to a basic human culture.

¹²We are engaged currently in further research about the genesis and trajectory of UNESCO's interest and involvement in other education priorities such as teacher and teacher education.

¹³The four phase periodization partly draws on and extends [Mundy's \(1999\)](#) work on UNESCO which has periodized the work of UNESCO into three phases. It is important to recognize that this intellectual periodization is not strictly chronological—instead it uses a broad historical period as a basis to sketch the intellectual idea and thoughts that animate the education policy and programming of UNESCO.

¹⁴Based on a review of secondary and primary literature relating to UNESCO from its very inception until the first three decades of its history (founding late 1980s).

While critiqued for its failure to achieve its goals,¹⁵ this approach suggested a shift in UNESCO's education vision to one which privileged the economic utilitarian purposes of education, reflecting the WB's rates of returns and human capital approach to education.¹⁶

With the formal ending of colonization in the 1960s for many countries in Africa, UNESCO paid attention to higher education,¹⁷ in particular, to the inclusion of higher education in national policies, connecting higher education with nation-building and development. During the late 1940s until the 1970s, UNESCO established the International Social Science Council (1948), the International Association of Universities (1950), and the Tokyo based UN University (1975) (Lebeau and Sall, 2011:130). The regional conferences organized by UNESCO on higher education show that, unlike the case of non-formal education, the aim of higher education was the potential of economic returns. This reflected the priorities of the donors as well as the members. However, this donor interest in higher education had declined by the 1970s (Lebeau and Sall, 2011; Mundy, 1999; Limage, 1999).

The publications of UNESCO during this phase suggested a strong focus on a more expansive view of education. Two documents, in particular, signaled this approach: (1) *Learning to be: The world of education today and tomorrow* (Faure Report) (UNESCO, 1972); and (2) the *Declaration of Persepolis* (UNESCO, 1975). These documents, especially the Faure Report, asserted UNESCO's educational agenda that committed to a broad notion of "lifelong learning". Both documents allude to the role of education in nurturing global citizenship while acknowledging the economic aims of education. The Faure report states that

[t]he explicitly humanistic and democratic approach to education that permeates *Learning to be* is hardly recognisable in contemporary discussions, in which the right to permanent education ... seems to have been replaced by the duty to continue to learn throughout one's life ...

Biesta (2021:para 3).

Lee and Friedrich (2011) maintain that the Faure Report has been drawn from the radical ideas of Paulo Freire, Ivan Illich and democratic liberalism that signify UNESCO's assertion of its intellectual autonomy and multilateral character.

The global education goal setting: from Jomtien to the twin global agendas of the EFA and the MDGs

UNESCO's second intellectual phase can be traced to the oil crises of the 1970s and the global shift to the right ushering in a period of new public management politics and economics which reshaped social sector provision and social policy¹⁸ that caused UNESCO to rebrand itself (Mundy, 1999; Elfert, 2019; Edward et al., 2018). This is reflected in the biennial World Education Reports of UNESCO (1991, 1993, 1995, 1999) that presented the state of education in different countries, while avoiding controversies (for instance, see Spaulding, 1992).

First, UNESCO remained committed to an expansive and universal education as represented in its International Literacy Year programmes, *Learning: A treasure within*, also known as the Delors Report 1996 (UNESCO, 1996), and the hosting of CONFENTIA V 1997. The Delors Report sought to establish UNESCO's hegemonic intellectual positioning in education and was a riposte to The World Bank's (1995) report, *Priorities and strategies for education*, which was, according to Elfert (2015b), narrow and reductionist. The Delors Report identified four pillars for social progress: learning to be, learning to do, learning to become and learning to live together, which reasserted UNESCO's earlier position on education and challenged the human capital orthodoxy of development thinking. Biesta (2021:8) notes:

Learning: The treasure within ... can be read as a response to a rapidly emerging alternative policy discourse that was strongly characterised by an economic rationale and a focus on lifelong learning as the development of human capital ... the Delors report made a case for shifting the attention from social cohesion to democratic participation and from economic growth to human development.

Second, UNESCO organized the World Conference of Higher Education 1998, that resulted in the World Declaration on Higher Education (UNESCO, 1998) based on UNESCO's initial core values of ensuring equal access to higher education to all, improving the quality of the provisions, and identifying higher education as a public good. However, UNESCO increasingly turned its focus toward EFA as discussed below.

Third, this intellectual phase marks the beginning of a global movement toward global education goal setting. This has caused a disagreement between IOs about the leadership of this global agenda, especially UNESCO and the WB whose visions and values have frequently competed. This focus on collective global goal setting in education represents a significant departure from the

¹⁵See Limage, 1999.

¹⁶See Benell and Furlong (1998) and Tilak (2005) for an overview and critique of this approach.

¹⁷See also Mundy (1999).

¹⁸The oil crises brought with it the long period of the displacement of Keynesian economics in favor of liberal/neo-liberal economics beginning the 1980s onwards, intensifying in the 1990s, and then reaching the global goals at the turn of the millennium.

consultation of a global education policy and demonstrates how a global framing of education became the driver of education change.¹⁹

This focus on global goal setting occurs in a context in which neoliberal frameworks were shaped by globalization that significantly influenced education policies across the world (Rizvi and Lingard, 2010). The 1990s saw a return of the Structural Adjustment program of the 70s in many countries in the Global South in which state responsibility, support and expenditure on social sector spending was curtailed in favor of the neo-liberal market, privatization approaches to education delivery that included a results-based management, a focus on aid and global goal setting. This is discussed in *Negotiating the politics of multilateralism and global education governance* section of this paper.

The global goal setting approach to development manifested in The World Education Forum held in Jomtien in 1990 (World Education Forum [WEF], 1990) that represented an uneasy and fractious global alliance between different stakeholders, including competing IOs, such as UNESCO and WB, national governments, and Civil Society Organizations (CSOs). The adoption of the Jomtien Declaration and the corresponding *Framework for Action to Meet Basic Learning Needs* by UNESCO, steered its education policy and programming for the next 10 years or more laying the groundwork for its Education for All movement in 2000 (UNESCO, 1990). These processes were in addition to UNESCO's initiatives, like the Delors Report, that focused on the broader aims of education. Thus, within UNESCO, two approaches to educational agenda—one in which education was seen in a broad framework of human rights, and the other that restricted the aims of education to human capital development—were beginning to consolidate.

Mundy (2006) argues that this period of global education was marked by a lack of coordination, decentralization and disorganization between the IOs that officially cooperated on educational programmes, with multiple views of the aims and goals of education. The period could be seen as a “fractious epistemic community” with “very loose coupling between rhetorical commitments and practical activities—creating, in effect, a smorgasbord of priorities and approaches from which donor countries might choose according to their own geopolitical and economic interests” (Mundy, 2006:27–28). What was emerging, albeit in an inchoate and opaque manner, was the discursive constitution of a global hegemony of what is valued and is to be measured in education. This intensified competition between the WB and UNESCO in education policy over the Global South.

The Dakar EFA and MDG phase

The period between the World Education Forum in Dakar in 2000 and 2015 could be identified as the third phase in UNESCO's intellectual history as the custodian of the global education agenda. It sought to bridge the focus on an expansive right based education agenda with a narrower technocratic- and instrumentalist view of education.

The Dakar Conference, led by UNESCO in April 2000, and the adoption of the Dakar Framework at the WEF (2000) provided the first formalized set of six global education goals that established a global education policy agenda with measurable strategic actions and targets.

The six EFA goals are:

(i) expand and improve comprehensive early childhood care and education, especially for the most vulnerable and disadvantaged children; (ii) ensure that, by 2015, all children, particularly girls, those in difficult circumstances, and those belonging to ethnic minorities, have access to and complete, free and compulsory primary education of good quality; (iii) ensure that the learning needs of all young people and adults are met through equitable access to appropriate learning and life-skills programmes; (iv) achieve a 50% improvement in adult literacy by 2015, especially for women, and equitable access to basic and continuing education for all adults; (v) eliminate gender disparities in primary and secondary education by 2005, and achieve gender equality in education by 2015, with a focus on ensuring girls' full and equal access to and achievement in basic education of good quality; and (vi) improve all aspects of the quality of education and ensure the excellence of all so that recognized and measurable learning outcomes are achieved by all, especially in literacy, numeracy and essential life skills.

WEF (2000).

Following the Dakar WEF, the UN General Assembly in September 2000 (UN, 2000) announced the eight MDGs out of which only one directly related to education: “to achieve universal primary education”. The other goal indirectly related to education was to promote gender equality and empower women with a corresponding target to eliminate “gender disparity” in primary and secondary education. The MDG education targets were considerably narrower than the Dakar EFA targets and clearly omitted early childhood education, adult education, and quality education. The MDGs also narrowed down the EFA concept of gender equality to gender disparity. In so doing, the adoption of the MDGs in September 2015 set in motion a twin track global education agenda. This put UNESCO, as the custodian of the six EFA goals, in opposition to other IOs, in particular the WB that was supported by multiple donors and certain CSOs who saw it as the driver of the MDG agenda and a strong advocate of a narrowly defined understanding of education as mere physical access to schools.

Hulme and Scott (2010) trace how the MDGs emerged from a complex negotiated process that involved not just the UN but also the OECD, the World Bank, and the IMF. They elucidate how the MDGs were aligned with OECD International Development goals (IDGs) so that there would be only one set of goals to follow (Hulme and Scott, 2010:297). However, this alignment with the IDGs

¹⁹There were global goals in education before Jomtien. However, Jomtien represents the first formal process by which multilateral agencies, donors, Bretton Woods institutions, national governments and CSOs came together to develop a hegemonic view of what is globally desirable in education.

caused a disagreement between the MDGs and the Dakar EFA goals that resulted in a dual educational architecture with rival planning processes and organizational commitments which exerted parallel and dual pressures on national governments (Sayed et al., 2012:193). These developments, rather than drawing attention to the need for more robust education agenda, increasingly replaced the EFA goals with narrowing priorities in the global education policy.

During this period, UNESCO was given the role of coordinating and monitoring the progress toward these goals with a specific mandate to produce annual monitoring reports. The implications of this for UNESCO are discussed in the next section. However, this role increasingly narrowed the scope for UNESCO to define its own independent intellectual trajectory and reduced its agenda to producing Global Monitoring Reports of global education policy goals. Also, the execution of its monitoring role reveals the narrowing of the education vision evident in the two rival global education agenda, for example, in the use of monitoring indices as monitoring tools as pointed out by Tilak (2005:75)²⁰ who states,

As a whole, the EFA goals refer to six specific dimensions, while the EDI refers to four. By contrast, the Millennium Development Goals require countries to focus in the area of education only on primary completion rates and elimination of gender disparities All of this may create confusion, if not chaos, among policy-makers and education planners in developing countries in their approach to EFA. Economic and finance ministries interested more in the Millennium Development Goals and associated aid may, in turn, pressure education ministries to concentrate on these alone. In fact, the set of six EFA goals can be viewed as a minimum set. Indeed, the EDI and the Millennium Development goals clearly reveal a phenomenon of 'minimization of minimum goals of development'!

As the 15 years of MDGs neared completion, UNESCO published a report titled *"Rethinking education: Toward a global common good"* (UNESCO, 2015) partly to position how it influenced the next generation of global educational goals. This was conceptually at variance from the Faure's and Delors' Reports in terms of excluding lifelong education as a concern, and in recognizing alternate visions of development (Elfert, 2015a). However, it does reaffirm a humanistic approach to education that goes beyond its economic aims and the principle of education as a public and common good (Tawil and Locatelli, 2015). It is difficult to say whether the report has served intellectual purposes as UNESCO has transited to adopting and achieving SDGs.

In the context of higher education, given the internal push from some member countries, UNESCO has re-instated its interest in the sector partnering with the WB. This collaboration resulted in the formation of the UNESCO-WB Task Force on HE that did not last for long. Its report, *Higher education in developing countries: Peril and promise* (UNESCO-WB Task Force on HE, 2000) pointed to the emergence of the twin track approaches in higher education goals. Halvorsen (2016:79) believes this report signifies the "silent compromise" between "UNESCO values" and "World Bank values".

There were several other reports that UNESCO produced during this time in HE such as *Higher Education in a Globalized Society: UNESCO Education Position Paper* (UNESCO, 2004), *UNESCO-OECD guidelines for quality provision in cross-border higher education* (UNESCO-OECD, 2005), *Towards Knowledge Societies Report* (UNESCO, 2005), and *Ranking and accountability in HE* (Marope et al., 2013). These reports were primarily concerned with policies, practices and debates on quality assurance that have emerged from a neoliberal approach to higher education. There is a lack of agreement in the literature on whether or not these works represent a "real" commitment to UNESCO's core principles (for example, Blackmur, 2007; Halvorsen, 2016; Lebeau and Sall, 2011).

This phase in UNESCO's intellectual history in the field of global education sought to position its prominence in education, while other IOs developed rival visions pointing to a tension between a broad-based human-rights approach to education and a narrowed vision of "basic education" that was interpreted as basic primary schooling or "learning competencies" by some countries and implementing agencies (Muller, 2000; Sayed and Moriarty, 2020). This can be seen, for instance, in the 1997 OECD report, *Lifelong learning for all* (OECD, 1997) that interpreted learning as acquiring competencies to meet the needs of the global knowledge economy (Rubenson, 2006; Bagnall, 2000; Biesta, 2021). At the same time, as UNESCO took on the custodian role of monitoring the global goals, it began to frame what gets measured in education. The question that emerged in this phase is whether, in reporting of the attainment of the global goals, UNESCO was measuring that which is valuable and valued in education.

The quality turn, the return of lifelong learning and the Covid-19 pandemic²¹

The adoption of the Incheon Declaration on SDG4 in May 2015 at the World Education Forum may be seen as marking the beginning of the fourth phase for UNESCO's educational agenda. This phase traverses the period of the declaration of the SDGs in 2015 as well as UNESCO's response to the COVID-19 pandemic. During this phase, UNESCO asserted itself more firmly in the global education policy space notwithstanding its tensions and contradictions with other IOs. The SDGs aspire to address an ambitious range of economic, social and environmental issues globally by 2030. The SDG4 makes a commitment to "ensure inclusive and equitable quality education and promote lifelong learning opportunities for all". While this may signal a return of adult education in global policy as well as UNESCO agenda, critical policy literature on SDGs (Sayed and Moriarty, 2020; Elfert, 2019) delves into the political processes that shape these SDG4 concepts and their targets. Sayed and Moriarty (2020:212) document the complex struggles

²⁰In more recent times, the Global Education Monitoring Report, renamed from its original Global Monitoring Report, dropped the use of the EDI arguably due to the lack of utility and reductionism inherent in such an approach to monitoring.

²¹This we classify as the current phase encompassing both the SDG agenda agreed by the UNGA in September 2015 and the response to the Covid-19 pandemic.

during 2013 and 2015 with multiple intergovernmental meetings, such as in Dakar (2013), Muscat (2014) and Incheon (2015), between different alliances of stakeholders (mainly the MDGs and EFA alliances) negotiating their claims on the meaning of “quality”. The study has identified how SDG4 and its targets are based on a “pseudo-technicism” that omits “the rights-based understandings of quality, including inclusive and child-centered pedagogy, interactive teaching and learning processes in the classroom, a curriculum that encourages critical thinking, and respect for and understanding of human rights”.

Similarly, the inclusion of the concept of “lifelong learning” opportunities in the SDG4 sparks hopes for the return of the adult education agenda in UNESCO’s programming and global education policy. However, these are all speculations as the interpretations of lifelong learning could vary. In this context [Elfert \(2019\)](#) argues:

... two reports, both coming out of UNESCO, reflect divergent interpretations: The 3rd Global Report on Adult Learning and Education (GRALE) emphasises that the SDGs place a stronger focus on adult learning and education than did the MDGs ([UIL, 2016:15](#)), while UNESCO’s Global Education Monitoring Report 2016 observes that the 10 targets [of SDG 4] fail to deal explicitly with adult education. [UNESCO \(2016:222; see also p. 236\)](#).

The meaning of lifelong learning also needs to be seen in the post-2015 development context that is marked by a shift in investment attention of major donors toward secondary and higher levels of education. This shift is guided by the financial slump of 2008, that encouraged donors, such as the WB and the OECD, to focus lending programmes on higher levels of education that guarantee a better return on investment ([Mundy and Verger, 2015; Elfert, 2019](#)). In this context, the SDG4 framework of lifelong learning opportunities is an attempt to signal a focus on education beyond primary education especially tertiary education but not necessarily adult education ([Elfert, 2019](#)). This is evident from the recent exaggerated focus of UNESCO on higher, vocational and work skills-based education.²²

This phase is also marked by UNESCO establishing itself in the field of education amid the increased dominance and specialized programming of competing organizations, such as the WB, OECD, UNICEF, and INGOs (that are further discussed in [Negotiating the politics of multilateralism and global education governance](#) section). In this attempt, UNESCO has often collaborated with competing organizations in this congested terrain with a growing consensus on education for development or, what [Mundy \(2006\)](#) refers to as the “new development compact”. These collaborations have created a contradiction within UNESCO’s own programmes.

It is yet to be seen how Covid-19 pandemic will impact the SDG4 programming of UNESCO. UNESCO’s publication focus has understandably shifted to the Covid-19 pandemic education in the developing world since 2020. The focus of this has been on school closures, learning losses, digital divides, inequities in education, curricular and pedagogic challenges, socio-emotional learning, and psycho-social support. With Covid-19 triggering major humanitarian, social and economic crises in the developing as well as developed countries, the democratic goals of education also become as important as they were in the post-World War II context. UNESCO’s report, *Reimagining our futures together: A new social contract for education* (2021a), looks beyond the Education 2030 Agenda as discussed in detail below but a concerted effort to engage with the more complex education questions and contested issues is yet to be seen in UNESCO’s publications.

The assertion of UNESCO’s global education discourse: from the Delors Report to the Futures Report

As a producer of regimes of truth, UNESCO has developed global education through various reports. Four such significant reports have been produced by UNESCO since 1946. These are: (a) *Learning to be* (the Faure Report) ([UNESCO, 1972](#)) (b) *Learning: The treasure within* (the Delors Report) ([UNESCO, 1996](#)); (c) *Rethinking education: Toward a global common good* ([UNESCO, 2015](#)); and (d) *Reimagining our futures together: A new social contract for education* (henceforth the Futures Report) ([UNESCO, 2021a](#)).

The Delors Report (1996) was published at a critical juncture for UNESCO when the parallel educational discourses and compulsions were emerging in its work. The Futures Report, the most recent of its reports, was published at a time when aligning with the neoliberal frameworks and colluding with a narrowing economic view of education have impacted UNESCO’s educational agenda. In order to map this shift in the organization’s work, the discussions have been organized under four subsections.

Setting the problem

The Delors Report responds to a world in which education is “one of the principal means available to foster a deeper and more harmonious form of human development and thereby to reduce poverty, exclusion, ignorance, oppression and war” ([UNESCO, 1996:13](#)). Mindful of the global/local dialectic, it suggests that “people need to gradually become world citizens without losing their roots and while continuing to play an active part in the life of their nation and their local community” ([UNESCO, 1996:17](#)).

²² A large percentage of UNESCO’s publications cataloged in its Digital Library on higher education, skill development and technical and vocational education, were published 2015 in contrast to more recent publications on adult education and literacy. Thus, it can be argued that, despite its rights-based and conceptually broader policy choices, UNESCO’s work in relation to the SDG4 appears to delegitimize this as a priority. However, as SDGs are still being implemented, it is somewhat premature to draw a firm conclusion.

This report identifies globalization and its tensions, such as that between tradition and modernity, the equality of opportunity, and technology, as key socio-cultural challenges while noting the need for an individual humanistic education vision. In this report, the mission of education is “to enable each of us, without exception, to develop all our talents to the full and to realize our creative potential, including responsibility for our own lives and achievement of our personal aims” (UNESCO, 1996:19).

Coming on the back of the liberalization of economies in the 1990s after the fall of the Soviet bloc and changes in international world order, the report notes that:

[t]here exists today a global arena in which, whether we like it or not, the destiny of every individual is to some extent played out. World-wide economic, scientific, cultural and political interdependence – dictated by the opening up, under the pressure of free-trade theories of economic and financial frontiers, reinforced by the break-up of the Soviet bloc and finding an instrument in the new information technologies – is becoming ever more securely established ... What is more, the widespread realization that international relations are now globalized is itself a dimension of the phenomenon. Despite its latent promise, the emergence of this new world, difficult to apprehend and even more difficult to predict, is creating a climate of uncertainty, not to say apprehension, which renders the search for a truly global approach to problems even more half-hearted.

UNESCO (1996:39).

In this “new World”, the report advocates for an education which addresses inequity and plays a special role in the building of a mutually supportive world engendering a new humanism characterized by ethical principles. It also understands and respects different civilizations as a much-needed counterweight to a globalization that would otherwise be only in economic or technological terms (UNESCO, 1996:50).

The report also supports the strengthening of the nation state to ensure that it is not eroded and where democracy is a fundamental principle that nurtures “freedom, peace, genuine pluralism and social justice ...” (UNESCO, 1996:56).

The report does not view education as solely focused on economic growth but as “a broader perspective of human development” (UNESCO, 1996:69). It calls for establishing

new links between education policy and development policy, with a view to strengthening the bases of knowledge and skills in the countries concerned, encouragement of initiative, teamwork, realistic synergies taking local resources into account, self-employment and the spirit of enterprise.

UNESCO (1996:81).

Almost 25 years later, the Futures Report saw a global threat to the planet and humanity. Using similar language of interconnectedness and interdependencies, it advocates for a social contract arguing that the world is at a “turning point” and that development needs to recognize how the “quest for growth and development” has “overwhelmed our natural environment, threatening our own existence ...” (UNESCO, 2021a:1). In its analysis of the global context, it places a hopeful (and perhaps naive) belief in reason and knowledge “in creating better futures” (UNESCO, 2021a:1). The underlying idea and principle of a social contract invokes Rousseau’s ideals of “an implicit agreement among members of a society to cooperate for shared benefit” and as a starting point for “shared vision of the public purposes of education” (UNESCO, 2021a:2). Like the Delors Report, this report identifies multiple and interlocking crises and challenges including inequality, climate change, biodiversity loss, resource use that exceeds planetary boundaries, “backsliding in democratic governance” and disruptive technological automation (UNESCO, 2021a:3). Therefore, both reports draw on similar discourses even though the Futures Report does so in more subtle and non-controversial ways.

Knowledge and learning

The Delors Report identified four pillars of education with the aim of equipping each individual “to seize learning opportunities throughout life, both to broaden her or his knowledge, skills and attitudes, and to adapt to a changing, complex and interdependent world” (UNESCO, 1996:85). The Learning to know, Learning to be, Learning to do and Learning to live together framework, the commission believes, provides the basis for “meeting the challenges of the coming century” (UNESCO, 1996:85). Such an expansive view of education is designed

to enable each individual to discover, unearth and enrich his or her creative potential, to reveal the treasure within each of us. This means going beyond the instrumental view of education, as a process one submits to in order to achieve specific aims (in terms of skills, capacities or economic potential), to one that emphasizes the development of the complete person, in short, *learning to be*.

UNESCO (1996:86).

Unlike the Delors Report, the Futures Report pays more attention to education process in relation to curriculum, pedagogy and assessment as the new social contract proposed “needs to allow us to think differently about learning and the relationships between students, teachers, knowledge, and the world” (UNESCO, 2021a:3). Underlying the educational philosophy of this report is the following framework of principles:

- i. Organizing pedagogy around principles of cooperation, collaboration, and solidarity, to enable fostering of “the intellectual, social, and moral capacities of students to work together and transform the world with empathy and compassion” (UNESCO, 2021a:4). This pedagogy would also have to enable the unlearning of biases, prejudice and divisiveness and assessments would have to reflect these dimensions of pedagogy;
- ii. Curricula which emphasizes ecological, intercultural and interdisciplinary learning;
- iii. Professionalization of teaching, where collaboration and teamwork characterize the work of teachers, and wherein teachers are seen as “knowledge producers” and support is provided for their “autonomy and freedom” and their participation is “fully in public debate and dialog on the futures of education” (UNESCO, 2021a:4);
- iv. Schools as sites to foster inclusion, equity and individual and collective well-being and digital technologies. It highlights the need to support and not replace schools and that the schools need to also become “exemplars of sustainability and carbon neutrality” (UNESCO, 2021a:4);
- v. Learning, as not only taking place throughout life, but also in different “cultural and social spaces”, thus highlighting the need for education to be lifelong and encompass the right to “information, culture, science and connectivity” (UNESCO, 2021a:4).

This report takes a broad intersectional and decolonial approach to education arguing that:

[p]edagogies of solidarity must also recognize and redress the systematic exclusions and erasures imposed by racism, sexism, colonialism, and authoritarian regimes around the world ... Pedagogies of respect, inclusion, belonging, peacebuilding, and conflict transformation go beyond merely acknowledging or tolerating difference ... The world is rich in multicultural and multi-ethnic societies and education should promote intercultural citizenship ... The basis for intercultural citizenship is the affirmation of one's cultural identities. Knowing who you are is the starting point for respecting others. Intercultural education should not be used as a tool for the assimilation of cultural minorities, indigenous peoples, or other marginalized groups to the dominant society, but rather to promote more balanced and democratic power relations within our societies ...

UNESCO (2021a:52–54).

Based on the above vision for learning/education, the report sees knowledge as a pedagogical relationship formed by teachers and students in which teaching and learning “are both nourished by, and contribute to, the knowledge commons” and in which “... teachers and students need to form a community of knowledge-seekers and builders nourished by and contributing to humanity's knowledge commons” (UNESCO, 2021a:51).

While the Futures Report acknowledges the need to promote democratic power relations, it fails to articulate the basis on which socio-cultural difference is constituted. In an attempt to project a positive and hopeful view of the social contract, the report elides and simplifies difference and does not see how it is conjuncturally and politically shaped as a driver of conflict. It fails to provide a sound basis for dealing with the dialectic between sameness and difference. Similarly, while the report sees educational processes and knowledge generation as essentially participatory, without a corresponding understanding of difference that undercuts such action, it does not sufficiently support envisaging the systems where such vision translates to practice.

Realizing the education vision

The Delors Report recognizes that, to realize its vision for education, political choices/decisions need to be made by the “public authorities” in both developed and developing countries:

... the pressure of these demands, which fall largely upon the public authorities, necessitates organizational choices which are often in reality socio-political ones. Policy-makers are faced with conflicting interests: industry demands more and more skills and aptitudes; science wants funds for research and the kind of top-flight higher education that produces young researchers; the arts and academia want the wherewithal for improving school enrolments and general education; and parents' groups militate for more high-quality education ... a better supply of good teachers. The dilemma becomes especially acute when it becomes impossible to satisfy all these demands ... each demand is based on legitimate expectations that all correspond to one or other of education's basic functions.

UNESCO (1996:156–157).

The report emphasizes the role of democratic public debate “not only on the resources to be made available to education but also on its ultimate goals” (UNESCO, 1996:157). It advocates decentralized decision making, involving all stakeholders, encourages autonomy of schools in various decision-making aspects and in the presence of a strong central administration with a strong role for the state as representative of the whole community, in a pluralistic and partnership-based society where education is a lifetime affair.

Drawing from this, the report highlights that investing in education is more than a social investment; it is also an economic and political investment—in building the nation, citizenry and preparing the citizens for the world of work. In light of this, it lays emphasis on the role of public funds, as against a private funding/market, as one of education's central concern is not to “heighten social inequalities” so “large scale resources must be channeled toward the most disadvantaged ...” (UNESCO, 1996:167).

The Futures Report views a “massive commitment to social dialog, to thinking and acting together” as crucial to forge the new social contract for education which would “overcome discrimination, marginalization, and exclusion” (UNESCO, 2021a:5). Specifically, the report, while emphasizing the need for viewing education as a global public good and placing the central responsibility

on public authority, also suggests “more just and equitable cooperation among state and non-state actors. Beyond North-South flows of aid to education, the generation of knowledge and evidence through South-South and triangular cooperation must be strengthened” (UNESCO, 2021a:5). The international community is called upon to enable states and non-state actors to realize a common/shared vision of the new social contract. In this, it argues for a key leadership role for universities that are creative, innovative and committed to strengthening education as a common good for the future of education and in building the social contract.

International cooperation and UNESCO's role

The Delors Report argues for the need for global responses toward

... building a better-or less bad world [that] has become as never before everyone's business ... Co-operation in education should thus be viewed in the broader context of what the international community must do to stimulate awareness of all the problems requiring solution and achieve consensus on the issues needing concerted action; this action will involve international and intergovernmental organizations, governments, non-governmental organizations, business and industry, professional and labour organizations and ... those actively participating in the education system and the intellectual community, all working together as partners.

UNESCO (1996:177).

It highlights the need to radically rethink international cooperation through not only aid policies but also partnerships which foster exchange and cooperation within regional groupings, promote and encourage the education of girls and women through strong international cooperation for policy, encourage debt swaps to offset adverse effects of adjustment policies and strengthen national policies through international cooperation, among other aspects (UNESCO, 2021a:189).

Within this strengthened and broadened international cooperation, the report sees UNESCO as especially suited to exercise its moral authority in the international sphere:

Although UNESCO is neither a funding agency nor a simple research institution, it has always had the task of developing human potential, in co-operation with its member states and its many partners and associates on the international scene ... The distinctive character of UNESCO lies in the scope of its responsibilities – not only education, but also culture, research and science, and communication – which make it an intellectual organization in the broad sense, less subordinate than others to a purely economic view of the issues ... As a moral authority and a setter of international standards, it pays as much heed to human development as to purely material progress. In the field of education, all these attributes predispose it to undertaking action on several fronts: helping Member States to build and reform their education systems and obtain the most benefit from the scientific and technological revolution, but also making the right to education a reality for all people throughout the world and promoting everywhere the idea of peace and the principles of justice and tolerance.

UNESCO (2021a:187 emphasis added).

The Futures Report calls for global solidarity and international cooperation and for a “renewed commitment to global collaboration in support of education as a common good, premised on more just and equitable cooperation among state and non-state actors at local, national and international levels” (UNESCO, 2021a:132).

The report describes the current atmosphere for international education cooperation as “increasingly precarious” with the “notion of a world society anchored in common universal values profoundly eroded” and global fora, such as the UN system, “responsible for establishing common goals and organizing global collective action” facing “harsh critique and fiscal constraint” (UNESCO, 2021a:132). It also points out the restrictions imposed on the work of non-state actors and civil society in an increasingly fragmented world which restricts their ability to build strong coalitions and also the difficulties of functioning in a post-pandemic world where finances are dwindling. This report advocates for the inclusion of diverse non-state actors in global governance through partnerships—a movement away from top-down toward multi-centric action—and new forms of regional cooperation, especially South-South and triangular cooperation (UNESCO, 2021a:133).

The report also looks critically at UNESCO's role over the years and highlights the complex context within which it works. However, it still highlights the advantages of UNESCO to forge the new social contract for education as follows:

UNESCO has faced many challenges over the past 25 years. While it has retained the formal responsibility for coordinating global dialogue and standard setting in education, and for ensuring achievement of SDG4 for education, it has struggled to meet these obligations effectively, and has faced severe criticism. It is sobering to note that despite the breadth of its mandate in education, science and culture, UNESCO's entire budget is smaller than that of many European universities. To play an effective role in our vision for sustainable educational futures, UNESCO will need to rethink its approach to educational development. Building on the principle of subsidiarity, it should see itself first as a partner whose job it is to strengthen regional and national institutions and processes. Secondly it is an evidence broker and an advocate for strengthened data and accountability to citizens at all levels of educational systems. While maintaining its unique role in fostering global dialogue for a new social contract for education, UNESCO must focus the bulk of its financial and human resources on regions where the right to education is most threatened – and particularly on Africa, where the vast majority of the world's youth will live and learn by 2050. UNESCO will need a clearer sense of its comparative advantage within the complex ecosystem of global and regional actors involved in educational norm setting, financing and knowledge mobilization. It should work with UN partners to find innovative solutions to ensure the right to education of involuntary migrants and displaced populations whose numbers are expected to multiply over the course of our uncertain century UNESCO has a unique capacity to convene and mobilize people and institutions around the world

to shape our shared educational futures. Herein lies its great strength. And it is precisely this strength that is needed to build a new, internationally agreed social contract for education and, more importantly, a new deal for implementing it.

UNESCO (2021a:138).

From the above, it is evident that the broad discourse, inclusive of the linguistic choices and their organizing principles, underlying the two reports presents a more nuanced view of education that goes beyond considering only the utility of education for economy. Both the reports conform to the humanistic principles of education and its centrality for civilizations and citizenship. Both the reports call for plurality in perspectives in understanding difference. However, the approaches of these arguments allude to a shade of difference in framing the educational agenda. While both the reports understand the role of education from a human rights perspective, the Delors Report, more assertively than the Futures Report, underlines education as a fundamental right thereby calling for greater interest in and resources for it. Similarly, the Delors Report, in critical and direct terms, calls for a global response to the neoliberal paradigm of education and development, whereas the Futures Report hints of this need by referring to inequalities, marginalities and exclusion. However, there is a clear noticeable shift in how UNESCO's own role has been articulated in the two documents – from an “intellectual organization” with a “moral authority” as “a setter of international standards” to a “partner”, “evidence broker” and “advocate”. This shift in the visualization of its own role is also evident in the difference in the authoritative voice of the Delors Report, to the propositional-reflective tone of the Futures Report.

Negotiating the politics of multilateralism and global education governance

The intellectual evolution of UNESCO serves as a case in point for understanding contestations about hegemony among multilateral agencies and IOs in the international global system. As stated above, the shifts in the intellectual history of UNESCO are inherently tied to the significant political junctures in the multilateral nature of UNESCO and its positioning vis-a-vis other IOs as well as internal member state contestation within UNESCO, in particular, the role of the countries representing the Global North (USA, UK). These negotiations have significantly impacted UNESCO's claim to global leadership in education. In this part, we discuss some of the critical points of how UNESCO's multilateralism has evolved and been shaped over its history.

UNESCO was established to formalize multilateral cooperation between nations for building political order/stability globally in a post-World War II context. Its primary focus was establishing peace by promoting human rights and strengthening bonds between nations through educational, scientific and cultural development. From being an IO that emanated from the European experience of the war, over the years, UNESCO has increasingly come to focus on the economically underdeveloped countries or the Global South. This focus on the Global South is a reflection of the fact that, as a member state UN agency, UNESCO needs to respond to its member states, particularly those who, in the 1960s, saw the formal, albeit not *de facto* ending of colonization. This unique form of multilateralism underlies the distinct identity and role of UNESCO vis-à-vis the other IOs as it creates a space for the representation of the voices of the Global South thereby opening possibilities for counterhegemonic politics and a relatively even balance of power in global policy negotiations. In this context, critical international relations theorists have argued that such post-war multilateralism of UNESCO and other institutions has carved “a distinctive political space, through which an ‘imagined’ world order was negotiated, constructed, and (at times) contested” (Mundy, 1998:452).

Through the close to eight-decade history of UNESCO, the unique multilateralism that forms the foundation of the organization has been debated and contested with regards to its policy, programming and its modus operandi. In this section, we recount three forms of this contestation and conflict in the history of UNESCO's work in education impacting its sustainability and the execution of its work program (Elfert, 2019).

The first is the use of funding as a mechanism to question the intellectual, policy and programming standing and legitimacy of the work of UNESCO through the withdrawal of membership. The USA (as well as the UK) has used funding as a key tool in negotiating its relationship with UNESCO. For example, USAID funding was withdrawn in 1965 for the literacy programmes of UNESCO—stating that Fundamental Education was “contrary to American ideals and traditions” (Dorn and Ghodsee, 2012:375). This incident is one of the early markers in how funding is used to steer the policy and programming directions of UNESCO.

UNESCO's literacy agenda was critiqued by the Global North, particularly the USA, as promoting communism in the Cold War. This withdrawal of funding for UNESCO's literacy agenda led to questions about the organization's status as a lead agency for education. This tension continued until the mid-70s, with USA-UNESCO relationships taking an unprecedented turn when the USA froze its funding in 1974 as the organization granted recognition to the Palestine Liberation Organization. Again, in the 1980s, the USA, followed by the UK and Singapore, withdrew membership and funding due to UNESCO's adoption of the MacBride Report, “*One world many voices*” (UNESCO, 1980). The report challenged the commercialization and monopolization of information and communication media by the powerful, mostly Global North nations, especially the USA, while calling for the liberalization and democratization of media by inclusion of countries in the Global South. The US re-joined UNESCO in

2003²³ until 2011 when it again froze its funding (without formally leaving UNESCO) on the matter of Palestine being granted full membership—finally quitting again in 2019.²⁴

This constant withdrawal of membership and funding (and re-joining) reflects the broad geo-political interests of the global governance in the multilateralist approach of UNESCO. In their work, *Hope and folly: The United States and UNESCO* (1989) Preston, Herman and Schiller identify the withdrawal of the US in 1984 as a significant turning point in the tense relationship between UNESCO as representing all countries and being a full membership agency and being an agency that privileged the voice of certain countries in the Global North. In their analysis, Preston et al. (1989:xiv) note that, following these developments, the criticism of UNESCO by the USA media was so obvious and powerful that it triggered the “anti-UNESCO” campaign and posed an unprecedented challenge to the phenomenon of multilateralism and international cooperation, “indeed, the criticism of the report, and of UNESCO in general, deviated so sharply from reality that the notion of a hidden agenda was hard to avoid” an observer noted and added that the crisis at UNESCO is “part of a challenge to US hegemony by most of the rest of the world” (Preston et al., 1989:xiv).

Similarly, the issue of membership of the PLO and Palestine reflect how UNESCO, as member state multilateral agency, reflects the tension and contestation between speaking for all, in particular, the Global South and speaking for the powerful state of the Global North. This tension is reflective of the broader development in the field of international education and development and, in particular, the efforts of the Global South to seek a voice and representation within the global architecture.

Second, the politics of multilateralism in the international aid architecture and UNESCO, in particular, is reflected in the relationship between IOs. In particular, in the evolution of UNESCO, a key issue is about the leadership of the education agenda and the vision that drives the global education agencies (as discussed in the previous section). This relationship has been particularly significant as, unlike other IOs, UNESCO has, since its inception, been dependent on external funding sources and is not mandated to be a funding agency. Generally speaking, the social, economic and cultural rights (including education) that are focal areas of UNESCO’s work, have been much contested within these agencies (Morsink, 2000; Elfert, 2019; Dorn and Ghodsee, 2012). On the one hand, given the post-war aftermath, social, economic and cultural rights (including education) were seen by the different IOs as being strongly linked with building democracy. On the other hand, until 1962, IOs, including the World Bank, “did not lend a single dollar” to educational programming and rebuilding efforts as there was no guarantee of return on investment (Dorn and Ghodsee, 2012:373). As the WB and the OECD began to prioritize education in driving economic growth, the leadership of UNESCO over the global education agenda was called into question. By the 1980s, the WB’s combined disbursements in education were nearly double those of the UN and its agencies (Torres and Schugurensky, 2002:429). The WB also created its own extensive technical expertise in a wide range of specializations in education and was providing expertise to the Global South for education policy programming. This strategic development and deployment of expertise has played a central role in increasing WB’s influence in global governance and global education policy. The enormous funding and extensive technical capacity of the WB irreversibly impacted the work of UNESCO and ultimately did lead to, as noted above, the dual track global education agenda.

As rapprochement between UNESCO and other IOs emerges, particularly around the new SDG 2015 agenda, UNESCO has begun to focus on becoming a monitoring agency to rebuild its credibility. UNESCO thus currently places great store on taking a monitoring role and, as such, its larger and more expansive education agenda is being challenged. This reflects a broader shift in development thinking about result-based management and “evidence-based policy”. Such a policy truth regime was spearheaded by international agencies, such as the WB, DfID, Education Development Trust, and others, that legitimized their role as international knowledge brokers (Verger et al., 2017). This regime, as evident in the MDG and SDG frameworks and monitoring metrics, limited the scope and autonomy of states by de-territorializing local frameworks of action and establishing accountability frameworks of global education policy (Sayed and Moriarty, 2020). This arguably also resulted in a shift in which countries of the Global South are becoming part of the performativity regime of international development within IOs in general, including UNESCO. Mundy (1999) and Edward et al. (2018) argue that the signs of this narrowing role of UNESCO can be traced back to its attempts in the 1990s to rebrand itself from “lead agency in education globally” to “global intellectual forum”.

Third, the refashioning of its role as global education forum, reflecting its idea of convening power, is evident in the hosting of the International Task Force for Teachers in Education (ITFTE) by UNESCO. The ITFTE managed by UNESCO is “a voluntary global alliance including national governments, intergovernmental organizations, non-government organizations, international development agencies, CSOs, private sector organizations, and UN agencies”.²⁵ The ITFTE in UNESCO reveals two key issues about the multilateral role of UNESCO and its relationship to other IOs. In an “increasingly crowded policy space” for the work of teachers and teaching, and with larger organizations, such as the WB and OECD, developing similar “workstreams and activities”, the challenge for such entities hosted by UNESCO is to become a voluntary global education forum and to “have a clear view of the type of value it provides in comparison to the work conducted by other peers and incumbents” (ITFTE, 2021:12). Additionally, it is evident that such initiatives, including entities such as the Global Partnership for Education (GPE), raise questions about their relationship with their host and how the member state of UNESCO relates to such parallel hosting initiatives. Specially, in the case of the ITFTE, the question an evaluation of the ITFTE raises is of the “integration of the Task Force Secretariat in the UNESCO Section for Teacher Development” and its link to UNESCO’s policy and programming work. As such, initiatives like ITFTE, as is the case of the GPE

hosted by the WB, raise serious questions about the individual interests of IOs and efforts to work and collaborate in voluntary ways, and in ways in which funding is provided.

Fourth, while UNESCO happens to be the most critiqued and studied of all UN agencies, its organizational aspects and their broader influence on UNESCO's identity and multilateralism are much understudied, as is the case with many other IOs. In this respect, Jones' (1988) work focuses on how the internal organizational nature and dynamics, particularly related to its administrative and technical staffing, have critically shaped UNESCO's functions. As an intergovernmental organization, UNESCO's primary expertise is drawn from international civil servants who identify as experts in cognate areas of work. Who these expert civil servants are, who they represent, their positionality and their ideologies become crucial in shaping the multilateralism of UNESCO and its relationship to IOs. This is also the case with other IOs, such as the OECD and the WB, yet the gaze has not turned to them. This should therefore be a priority of research and scholarly attention.

This section highlighted how intricately linked UNESCO's work and functioning are to the geopolitical context which has repercussions for both its internal administrative/institutional functioning and its ability to negotiate with the larger global policy field to retain its intellectual and technical focus. It highlighted through four instances, how these impact the different dimensions of its functioning—as intellectual moral authority, as a global education agenda setter and as a convening body enabling wider global policy dialog and coherence. These, it is believed, would need to be studied through a critical interrogation of the working of the entire UNESCO machinery, to be able to shed light on the nuances of the role played by UNESCO in the fast-changing and increasingly uncertain global social, economic and political context within which education policy agendas are set, monitored and pursued.

Conclusion

The analysis in this paper has highlighted the shifts in UNESCO's intellectual trajectory unpacking its evolution in two respects—including its overall vision of education and its distinct positioning and identity as an IO. The discussions have tracked how UNESCO's initial conception of education as a human right and allegiance to a broad-based philosophically grounded connotation of education have come to coexist peacefully with the emergent global consensus on education for development compact. In the process of this evolution, UNESCO has both asserted its voice while resisting being a part of the new consensus, and colluded while finding its own space with competing IOs. It has eventually come to find more settled grounds in seeking to make itself visible in a crowded space, filled with financially stronger and arguably not equally democratically orientated IOs. This settlement has displaced it from the position of a distinct IO in the global education policy governance and has repositioned it to perform the relatively marginal role of a collaborator with strong Global South networks. This role includes being a repository of knowledge and expertise for capacity building but also being a convening and monitoring agency.

The analysis has suggested that this intellectual evolution of UNESCO is far from straightforward as it has been shaped by complex, multilateral politics and tensions not only with other IOs but within itself as well. Hegemonic negotiations between developed and developing member states of UNESCO have often resulted in sustainability, credibility and utility questions being raised on UNESCO's educational programming. Anti-UNESCO campaigns, arguably contrived by the hegemonic powers, provide examples of how establishing "intellectual and moral solidarity" is essentially a politico-economic project and not just an ideational or conceptual one. Both the internal and external tensions indicate how a politics of accords and compromises has determined UNESCO's intellectual ascendancy in the increasingly complicated North-South politics whereby the hierarchies of lending-borrowing as well as knowledge generation determine the weight of the voices of nations in the global economy. The analysis thus indicates how establishing a democratic multilateralism as a moral axis of a post-war world, a goal for which UNESCO was constituted, has remained a utopian dream.

These developments have resulted in a shift in UNESCO's approach toward its democratic vision of the post-war world, to increasingly skirting and eliding critical socio-cultural-economic questions of inequities and global tensions that shape the educational realities of our times. In certain instances, it has emerged that UNESCO's self-image has also seen a corresponding reshaping by losing its confident approach as a moral authority.

In this context, our analysis points to the need for future research on IOs in general and UNESCO in particular. Comparatively mapping the changes in UNESCO's discourse with those in other organizations around the critical time periods in global politico-economic history, in our view, will reveal much beyond the global governance politics, and would deepen the understanding about UNESCO. As a part of our ongoing research, we identify the need for a nuanced and fine-grained analysis of the day to day working and program level interventions of UNESCO at global and national levels. It also requires, in the case of UNESCO, a better understanding of its internal configuration including the relationships in work programmes between the headquarters, regional offices, institutes and country offices. This will partly assist in understanding how UNESCO manages itself as an intellectual/moral leader. A beginning point in this research agenda could be a rigorous study of UNESCO's Digital Archives to develop a detailed picture of its discourse. This proposal is not just to map broad trajectories in educational agenda but to study each of its focal areas in depth that would provide a basis for understanding how similar tensions are reflected in different areas of its work and its discourses. A study of UNESCO from the perspective of the international civil servants and technical staff, through collecting their institutional memory and oral history about the role that expertise has played and how it has shaped the evolution of UNESCO as an IO will, in our opinion, shed light on aspects that a global policy perspective may not reveal.

The intellectual trajectories of UNESCO reveal the complexity of an IO operating within a crowded international space, negotiating contested multilateralism as it seeks to be and become a repository of knowledge and expertise for capacity building, a convening and monitoring agency and a global leader in education. In so doing, it navigates the ways in which “political” and “technical” decisions are made. The analysis of UNESCO points to the need for a better understanding of how global education policy is shaped and reshaped across and between actors within the international development field and how positioning for hegemonic power discursively constitutes the formulation, implementation and monitoring of the global education agenda.

Introduction

Global Education Policy as a field emerged in the post-war era with the establishment of UNESCO and the Universal Declaration of Human Rights in 1948 (Mundy et al., 2016). Though nation-states continued to enjoy sovereignty with regards to the framing of national public policies, for the first-time education was placed on the post-war agenda of multilateralism. The UNESCO and UDHR focused on ensuring shared principles and values across countries. Education was declared as a basic human right. It was also considered that education "shall promote understanding, tolerance and friendship among all nations, racial or religious groups, and shall further the activities of the United Nations for the maintenance of peace" (United Nations n.d.).

Since the 1950s in the liberal democratic countries of the West, policy studies emerged as a field of study to study the policy-making process and its implementation. Governments also sought to draw on the rich resources of knowledge in the social sciences to inform policymaking, rather than an ad hoc and intuitive traditional approach to public policymaking. There was a prevailing positivist view of social sciences and a rationalist approach to make evidence-based policies with the help of social scientists and empirical research conducted by them.

Several approaches to policy studies have also emerged within academia, mostly developed in the context of the Nation-states located in the Global North. All these approaches, and theories are bounded by a methodological nationalism since policymaking has been mostly understood as a process within the domain of the Nation-States. In recent years, this methodological nationalism employed in policy analysis has been critiqued by scholars, such as Ball (2012), Rizvi and Lingard (2010), Silova et al. (2020). These scholars argue that it is necessary to consider the strong advocacy role played by the powerful intergovernmental organizations and transnational actors, such as the European Union (EU), the United Nations Education, Scientific and Cultural Organization (UNESCO), the Organization for Economic Cooperation and Development (OECD), multinational and transnational corporations, international financial institutions (such as the World Bank and International Monetary Fund), as well as a network of private sector coalitions (such as including Hewlett and Gates Foundations) in assembling policies around the world in this age of neoliberal globalization.

Scholars further argue that it is also important to consider the historic experiences of the postcolonial nations of the Global South seriously because of the process of policy transfer from the colonial metropole of the Global North to the colonies in the Global South since the colonial times. Silova et al. (2020) argues, "All modern education systems arose relationally, be it through purposeful learning from systems elsewhere or by forceful implant by colonizing powers" (p. 3). Education policies and administration within these postcolonial nation-states have been historically shaped by congeries of local and global forces (Mukherjee and Suresh, 2018). Drawing on David Easton's (1953) definition of public policy as "authoritative allocation of values" and insights from a range of theoretical and methodological post-positivist approaches, Rizvi and Lingard (2010) attempted "to show how education policies represent a particular configuration of values whose authority is allocated at the intersection of global, national and local processes".

Moreover, policy translation is complex process that involves discursive practices, various national and transnational political actors, and institutional change. Much has been written in recent years about translation as a policy process analytical framework (Lendvai and Stubbs, 2007, Stone, 2012). They argue:

By reconsidering our understanding of the policy transfer process from the point of view of translation we would argue instead that the policy transfer process should be seen as one of continuous transformation, negotiation, and enactment, on the one hand, and as a politically infused process of dislocation and displacement ("unfit to fit"), on the other hand.

Lendvai and Stubbs (2007, p. 180).

Hence, in this article we will discuss the translation of two major global education policy mandates since the 1990s- Education for All and the Millennium Development Goals within the local context of postcolonial India, as a case study. We will discuss the continuous process of translation, transformation, negotiation, and enactment of these policy mandates according to the values embedded in the postcolonial Indian national constitution, existing policies, and priorities of the local Indian societal context. Thereby, we suggest that the EFA and MDGs might have been also interpreted and translated differently in other systems of education based on their local histories and political traditions. In doing so, we also highlight the challenges of implementing the SDGs in the decades ahead of us.

Education for all

Through the initiative of four international organizations, World Conference on Education for All (WCEFA) was organized from 5 to March 9, 1990 at Jomtien, hosted by the Royal Government of Thailand. These four organizations were United Nations Educational, Scientific and Cultural Organization (UNESCO), United Nations Children's Fund (UNICEF), the United Nations Developmental Program (UNDP) and the World Bank. At this meeting over 1500 people representing 155 governments, 33 intergovernmental bodies and 125 non-governmental organizations, institutes and foundations signed the declaration titled "World Declaration on Education for all: Meeting Basic Learning Needs" and decided to guarantee quality basic education for all. Organized during the International Literacy Year, the conference set in motion renewed worldwide initiative to meet the basic learning needs of all children, youth and adults and adopted two documents: the World Declaration on Education for All and the Framework of Action to Meet Basic Learning Needs ([Inter-Agency Commission, 1990](#)).

Background

There have been several international conferences prior to the Jomtien conference focusing on the universal literacy and schooling and timebound approach of setting the targets. Some of them are UNESCO's Regional Conferences on Free and Compulsory Education in Bombay (1952), Cairo (1954) and Lima (1956); UNESCO Meeting of Representatives of Asian Member States on Primary and Compulsory Education, Karachi ("Karachi Plan, 1960"); UNESCO Conference of African States on the Development of Education in Africa, Addis Ababa ("Addis Ababa Plan, 1961"). What distinguishes WCEFA from the rest is the scale of participation and the commitments to enlarge the global resource pool to finance education.

This was also the result of a yearlong world-wide process of consultations prior to, during and after the conference at Jomtien. The three principal objectives of WCEFA were:

1. To highlight the importance and impact of basic education, and renew commitment to make it available to all
2. To forge a global consensus on a framework for action to meet the basic learning needs of children, youth and adults;
3. To provide a forum for sharing experiences and research results to invigorate ongoing and planned programs ([Inter-Agency Commission, 1990](#)).

WCEFA was happening following the decade of global economic recession of the 1980s. Most of the least developed countries and many developing countries were facing the challenges of enormous external debts, social and political instability, rapid population growth and environmental degradation. This concern was highlighted in the World Conference debate ([Inter-Agency Commission, 1990](#)). As a result of economic factors and partly due to the negative impact of structural adjustment programs, the state financing on the social infrastructure shrunk. Although total world expenditure on formal education increased to around 5.5% of world GNP in 1980s, material conditions of education in least developed countries deteriorated. There are two reasons for this decline: first, only about 12.5% of the total expenditure was incurred in developing countries. However, these countries have had three-quarter of the total world enrollment in formal education. Second, in many countries of the sub-Saharan Africa, Latin America and the Caribbean, there was a decline in growth of GNP and negative growth in some countries resulting into cutbacks in public expenditure on Education ([UNESCO, 1991](#)).

The EFA declaration and the framework of action

The EFA declaration begins by presenting a broad educational scenario highlighting the seriousness and need for adopting this resolution. It stated that, that there were more than 100 million children with no access to primary schooling in 1990, out of them more than 60% were girls, adult illiterate people were above 960 million out of them at-least two-third were women. More than one-third of the world's adults had no access to printed knowledge, new skills and technologies, and many more adults could not complete basic education programs. It is important to note here that the figures reported for literate and illiterate population are based on UNESCO's 1958 definition, based on the ability or inability to read and write short and simple sentences on everyday life. These data was gathered by the techniques involving self-reporting or based on number of years of schooling. However, if adhered to UNESCO's 1978 definition of "functional literacy" which focus on the ability to use literacy skills in self & community's development then estimated figures of illiterate population will substantially increase ([UNESCO, 1991](#)).

Therefore, at the outset the EFA declaration calls for synergetic efforts by combining exponentially increased wealth of information with the power of modern communication to make the goal of education for all achievable. This declaration recalls that education is a fundamental right of all people with an understanding that education will lead to make the world more safe, healthy and prosperous. It accepted that knowledge is an indispensable key for personal and social improvement with a recognition that traditional knowledge and indigenous heritage must be accepted as righteous.

The focus of the WCEFA was on revisiting and broadening the concept of basic education. Going beyond the rudimentary measures such as basic numeracy & literacy skills or number of years of schooling, the declaration emphasized on the expanded vision of basic education through ten articles:

1. Meeting basic learning needs to benefit every person of all ages across the world to be able to benefit from: basic education designed to cater their differential needs in-terms of learning content, pedagogy and empower them at the same to enable them to enrich cultural and moral values.
2. An expanded vision of basic education that encompasses person from all age groups, from different knowledge systems, education which is not restricted to the ambit of formal schooling institutions, and which promotes the values of life-long learning.
3. Universalizing access and promoting equity by rendering special attention to girls and women, disabled and the disadvantaged.
4. Focusing on learning rather than numerical expansion in enrollments to achieve and maintain an acceptable level of learning, to improve systems of assessing and allowing learners to achieve their fullest potential.
5. Broadening the means and scope of basic education by recognizing the significance of early childhood care and education, universalizing quality primary education for all person within and without formal schooling institutions, education that is not restricted to certain age groups or a single type of knowledge.
6. Enhancing the environment for learning by improving nutritional status, health care, physical and emotional support for the learners.
7. Strengthening partnerships between education department with other departments, at different levels of governing structures within the country and involving non-governmental organizations at local, national, and international levels in the process of financing, planning, implementing, and evaluating basic education programs.

To achieve the above vision, the WCEFA conference decided a set of strategies, which are listed in following three articles.

1. Developing a supportive policy context across the social, cultural, and economic sectors through strong political will, fiscal measures, institutional strengthening, appropriate policies in sectors such as trade, labor, health, and employment. Improving the quality of higher education and scientific technological research.
2. Mobilizing financial and human resources through enlarged public and private sector engagement.
3. Strengthening international solidarity by establishing fair economic relations within and between the nations to redress existing economic disparities.

Along with these strategies and requirements, the EFA declaration set the goals and targets for the decade of 1990s as following (EFA 1990):

1. Expansion of early childhood care and developmental activities, including family and community interventions, especially for poor, disadvantaged, and disabled children.
2. Universal access to, and completion of, primary education (or whatever higher level of education is considered as "basic") by the year 2000.
3. Improvement in learning achievement such that an agreed percentage of an appropriate age cohort (e.g. 80% of 14-year-olds) attains or surpasses a defined level of necessary learning achievement.
4. Reduction of the adult illiteracy rate (the appropriate age group to be determined in each country) to, say, one-half its 1990 level by the year 2000, with sufficient emphasis on female literacy to significantly reduce the disparity between male and female illiteracy rates.
5. Expansion of provisions of basic education and training in other essential skills required by youth and adults, with program effectiveness assessed in terms of behavioral changes and impacts on health, employment, and productivity.
6. Increased acquisition by individuals and families of the knowledge, skills and values required for better living and sound and sustainable development, made available through all education channels including the mass media, other forms of modern and traditional communication, and social action, with effectiveness assessed in terms of behavioral change.
7. With the signing of the world declaration, there was a major thrust globally through revitalizing existing policies and structures, new resolutions and legislations, and enhanced allocation of funds to align literacy and educational programs with that of EFA's framework.

Review of EFA goals

In the second meeting of international consultative forum on Education for All held at Delhi, India in 1993 presented progress made in 2 years. Within 1st years, 13 out of 155 countries expanded their budget on basic education substantially, more than 100 countries defined the goals and plan of action to implement EFA and 56 countries initiated mechanism to promote and monitor the progress of EFA goals. International organizations too improved their funding substantially, for example, the World Bank doubled its loans for basic education, UNDP's allocation for basic education increased to two-thirds of its programs for 1992–1996 and UNICEF committed to allocate 25% of its budget to basic education by the year 2000 (Torres, 1999, p. 7).

Mid-decade assessment presented in FEA Forum in 1996 showed that "school enrollments in developing countries grew by 50 million pupils (from 496 million to 545 million), double the pace of growth in the 1980s. Regions with the highest growth rates were South Asia and sub-Saharan Africa (33 million), followed by the Arab States (5 million), Latin America and the Caribbean (6 million) and East Asia (5 million). The number of out-of-school children fell from 128 million in 1990 to 109 million in 1995" (Torres, 1999, 5).

However, it is apparent from several reviews in the following years that there are several trajectories of the progress made within each country. Some of the main challenges that explain these shortcomings were presented in EFA forum in 1996. It includes lack of determined action; misperception on the part of developed countries that EFA not being their priority; misunderstanding that EFA is indeed “schooling for all”, thus prioritizing creating new schools and increasing enrollments while neglecting qualitative improvements in learning goals—especially those envisioned in “expanded vision of basic education”, paid inadequate attention toward learning needs of adults and out of school youth (Torres, 1999, p. 6). The Amman Affirmation conceded to the fact that despite giving utmost priority to close the gender gap in education, the progress toward this goal is “excruciatingly slow”. It was observed in this assessment that in many underdeveloped countries, less emphasis was given to early childhood education, adult education and out-of-school literacy programs. This assessment also noted the tendency of missing the significance of essential link that connects basic education with secondary and higher education, teacher training and development of technical and vocational skills (UNESCO, 1996a,b).

In a comprehensive review of Education for All (EFA) in a decade following the Jomtien conference in 1990, Torres (1999) argues that this conference redefined the scope of basic education but the original vision, design and targets of the EFA did not materialize and instead the goals have been interpreted selectively and their scope had “shrunk”. The policy programs designed on the principles of EFA in most countries failed to implement the ideas of rethinking and transforming of education. This was mainly caused by increased pressure from the international organizations to meet the goals of EFA in an insufficient timeframe, thus resulting into minimalistic approach and short-term solutions. Thus, globally there was a quantitative expansion in terms of provision of schooling infrastructure, increased enrollment numbers and training programs but the qualitative achievements were far from satisfactory.

Original EFA declaration was for all countries, but developed countries considered their role as funders and did not find it necessary to meet the targets of EFA owing to their developed status and considered the program applied for developing countries. Onus of implementation was shifted on individual countries whereas in the declaration, it was proposed that EFA and basic education was a shared responsibility of governments, civil society and international community. The overall trajectory indicates that in the process of the implementation of EFA strategies, most developing and underdeveloped countries followed the quantitative measures such as increasing number of schools, number of years of schooling and enrollments at primary levels and targeting the children in most vulnerable section of the population. The priorities were given to improve physical environment in schools rather than creating learning environment for all (Torres, 1999, p. 18).

Indian education scenario

In the colonial India, formal schooling institutions were established and expanded but its access was largely limited to wealthy class and upper caste communities, the literacy rate at the time of independence was as low as 16% and about two-third of Indian children had no access to schooling. Postcolonial Indian Constitution adopted the goal of free and compulsory education for all children till the age of fourteen as its directive principle of state policy (Article 45). Initial target of 10 years from the commencement of the constitution in 1950 to achieve this goal was soon realized to be ambitious and unattainable.

In the following decades, a priority was accorded primarily to quantitative expansion of schools to make them accessible with a target of improving enrollments and foundational literacy.

The goal of universal education has been reiterated through all important policy documents, schemes, and programs since independence, such as National Education Policy (NEP, 1968), NEP (1986) and updated policy of 1992 also known as Program of Action (PoA), and recently NEP (2020). Apart from these important policy documents, there have been several interventions such as the scheme of Non-Formal Education (1979), Operation Blackboard (1987), District Institutes of Education and Training (1987), Mahila Samakhya program (1988). To target its vulnerable population groups, state specific Basic Education Projects were launched like the Minimum Levels of Learning (1978), Andhra Pradesh Primary Education Project (APPEP, 1984), Bihar Education Project, Uttar Pradesh Basic Education Project, Lok Jumbish in Rajasthan; District Primary Education Program (DPEP, 1994). India has also implemented schemes to cover entire population such as National Program of Nutritional Support to Primary Education (1995); Sarv Shiksha Abhiyan (2000) and Education Grantee Scheme (2004–05) (Shirname, 2007, p. 11).

Lok Jumbish, Rajasthan

Launched in 1992 with the external aid from SIDA, Lok Jumbish was an important intervention toward achieving the goals of basic education in the state of Rajasthan. The main theme of this program was community mobilization and transforming mainstream education system to ensure that every child has access to basic education. The delivery of this program was channeled through community demand for more schools, a greater number of teachers and for improved school environment.

This program focused on empowerment of women and adolescent girl children belonging to vulnerable communities by expanding the access to formal and non-formal education. This project covered 58 blocks and 9755 villages of the state. Under this initiative, more than 2800 groups of women were mobilized, more than 800 schools were established.

Despite the immensely positive outcomes achieved under this initiative, this program was closed after 7 years of implementation. The main challenge this program faced was the resistance from dominant communities and political leaders from Rajasthan. It is important to take into consideration how the socio-cultural aspects such as caste hierarchy, patriarchy play important role in the success and sustainability of any educational intervention (Ramachandran, 2001).

District Primary Education Program (DPEP)

Launched in the year 1994, this program was the first one wherein in Government of India took support from the World Bank in the area of primary education. Apart from the loan provided by the World Bank, there were other funding agencies such as the Official Developmental Assistance from UK, European Union, the Government of Netherland and UNICEF.

The guidelines issued by the Government of India in 1995 highlights that the motivation for this initiative lies in the efforts made since independence toward the goal of achieving universal elementary education and limitations it faced (MHRD, 1995). This document recognizes the limitations of quantitative expansion of schools. It recognizes that it is not the sufficient condition to achieve the goals of basic education. The objectives in the DPEP program focuses on “a holistic planning and management approach”, inclusive approach to cover schools in remote areas and catering to vulnerable communities, improving the teaching-learning competencies and materials, reducing gender gap in educational outcomes and convergence with programs on early childhood education and health. DPEP strategy was also derived from the experiences of other externally funded interventions such as Bihar Education Project, Uttar Pradesh basic education program and Andhra Pradesh Primary Education Project (MHRD, 1995). The strategy was also based on the empirical data based on six studies conducted by the team of scholars from NCERT and NIEPA on education finance, learning achievements, teacher policy and training needs, gender issues, educational problem of tribal children and textbooks.

This program was launched on a mission mode in 42 districts of 7 states which was expanded to 150 districts, and in 15 districts in a later phase. The main objectives of this program were as following (MHRD, 1995, p. 6):

1. To reduce difference in enrollment, dropout and learning achievement among gender and social groups to less than 5%.
2. To reduce overall primary dropout rates for all students to less than 10%.
3. To provide access for all children to formal or non-formal education.
4. To strengthen the capacity of national, state and district institutions.

In a mid-term assessment conducted in 1997, there was a modest increase in enrollment varying from 2.5 to 6.2%. However, three states witnessed decline in enrollments namely, Assam, Bihar and Maharashtra. Most important gain was made in the growth in enrollments of girls, especially in the districts where there was low female literacy rate (Aggarwal, 2000).

A review of the DPEP conducted for The World Bank by Sipahimalani-Eao and Clarke (2003) highlights similar trends. There has been a substantial progress made in improving the enrollment rates, and most districts achieved the targets of reducing gender disparities in enrollment. Similarly, there have been reductions in gender disparities in education. Levels of learnings have been also improved, especially in grades I and II. Other dimensions such as community mobilization, in-service teacher trainings, revision of textbooks to do away with gender stereotyping also indicate positive gains.

The limitations and challenges experienced in the implementation of DPEP are also important to understand the overall impact. Despite targeting educationally poor performing districts, the results shows that the enrollment rates of children from scheduled castes and tribal communities are still less. The goal to reduce the dropout rates to less than 10%, and targets of improving learning levels seemed to be too ambitious to achieve (Sipahimalani-Rao and Clarke, 2003, p. 10).

Sarv Shiksha Abhiyan (SSA)

Following the global UN declaration of the Education for All in 1990, Sarv Shiksha Abhiyan (SSA), literally meaning the Education for All Mission was launched in India in 2001–2002 as a flagship program to attain universal elementary education for all children in the age group of 6–14 by 2010. This program was designed to be an umbrella program to cover existing programs such as District Primary Education Program, Lok Jumbish and Operation Blackboard.

Despite multiple programs that have been launched since independence, there was still a great concern over the quality and coverage to cater to the educational needs of the diverse Indian population. Following the “bottom-up” process of planning, SSA was designed for active involvement from the community and in partnership with Local Self Governments and State Governments.

The Objectives of SSA were as follows:

- All children in school, Education Grantee Center, Alternative School, or “Back to School” camp by 2003.
- Bridge social, regional, gender gaps at primary stage by 2007 and at elementary education level by 2010.
- All children to complete 5 years of primary schooling by 2007
- All children to complete 8 years of elementary schooling by 2010.
- Emphasis on education for life.

- Universal retention by 2010.

The SSA focused on access, equity and equality through the development of schooling infrastructure, human resource development and qualitative improvements in teaching and learning outcomes. It paid special attention to bridge the gender gaps in education and children from minority communities, disadvantaged groups, who drop out before completing primary schooling. The SSA strategy involved bringing holistic changes and bringing institutional reforms through community-based ownership, management and capacity building of all stakeholders.

As a major step toward making elementary education universal and as a fundamental right, in 2002, an article 21-A was inserted in the Indian Constitution through Eighty-Sixth amendment Act. It reads:

The state shall provide free and compulsory education to all children of the age six to fourteen years in such manner as the State, may by law, determine.

The same act also substituted article 45 of the Constitution to provide early childhood care and education for all children until they complete the age of 6 years. Subsequently in the year 2009, “The Right of the Children to Free and Compulsory Education Act” was passed in the parliament and came into effect from 2010 (MHRD, 2011).

Achievement of Sarv Shiksha Abhiyan

The 2010 evaluation report on SSA by the Planning Commission of the Government of India highlights the achievements in key areas under this program as following (Planning Commission, 2010, p. xiv):

- Improved access—more than 98% of the rural habitations had access to elementary schools within 3 km whereas in urban areas 93% of the children in slums had access to schools within 1 km.
- Enrollments—Overall gross enrollment ratio was increased from 89% in 2003 to 93% in 2007; Enrollment ratio of girls significantly rose leading to gender parity ratio of 0.89 in rural schools and 0.82 in urban schools; Share of differently-abled children in total enrollment increased from 0.43% in 2003 to 1.17% in 2007; share of socially disadvantaged groups was 32% in rural and 30% in urban areas.
- Attendance—Average attendance improved, 62% of the rural schools reported average attendance of more than 75%.
- Out of school children/dropouts—Approximately 7% of the rural households and 20% of the households from urban slums had out of school children or dropouts.
- Infrastructure—88% schools had pucca (all weather buildings); 90% schools had drinking water facilities; 82% of the schools had common toilets but only 50% of the schools had separate toilets.
- Electricity and computer—in rural areas, 60% of the schools did not have electricity, whereas 82% schools in urban slums had electricity; only 11% of the schools in rural areas had computer aided learning, whereas in urban areas the coverage was 62%.
- Teaching Learning Materials—In rural areas, 75% of the schools were equipped with adequate TLMs, whereas in urban areas 93% schools had the TLMs.
- Free Textbooks—nearly 98% of the students in urban areas received the books whereas 84% of the students in rural areas received books at the beginning of the academic year.
- Pupil-Teacher Ratio—60% of the schools in rural areas and 57% of the schools in urban areas had adequate PTR.

Considering the vast population of the country, the achievements made under SSA are tremendous. Despite this achievement, the goal of universal elementary education has still not been achieved due to the diversity of its population and geographic conditions, as well as socio-economic disparities.

Some of the major limitations that SSA has faced are high drop-out rates and quality issues; problems of vacancies of teachers; untrained staff and absenteeism; inadequate teaching learning material; need for including local community in monitoring school performance; weak linkages between monitoring and supervision and last but not the least, the shortages in number of classrooms, separate toilets for boys and girls, and drinking water facilities.

Role of external aid

Initially the SSA was launched without any external support. Since 2004 Government of India has been taking contribution from three development partners namely, United Kingdom’s Department for International Development (DFID), the European Commission (EC) and the World Bank to support SSA. From 2003 to 2007, approximately 30% of the total expenditure on SSA has been disbursed by the three external aid partners. This aid money has been integrated into the central government’s strategy to implement the SSA. It has also helped in supporting the strengthening of technical abilities, assessment models and helped intensifying monitoring and supervision of the program (Ward, 2011).

In their paper, Colclough and De (2010) argue that international aid had not altered the policy priorities of educational expansion but, at the same time had a great impact on management practice, financial reporting, accounting procedures and monitoring

arrangements and provided resources for qualitative improvements. The programs such as DPEP and SSA had special role in improving the access to primary education nearing the goal of universalization of primary education.

The global policy mandate of EFA and international aid agencies can reasonably claim the credit in this achievement along with the government of India. However, critical scholars have argued against external aid in the education sector. They have argued with evidence that the structural adjustment policy connected to external aid has rather increased the pre-existing inequities within the education sector in India (Upendranadh, 1993; Tilak, 2008).

The Millennium Development Goals: Dakar framework of action

After a decade of efforts to meet the goals of EFA outlined during the Jomtien conference, participant member states of the international organizations met at Dakar, Senegal in the year 2000 and reaffirmed their commitment for achieving the target of education for all by 2015. Extensive review was conducted by all participant countries of the Jomtien conference and presented their findings in six regional conferences organized during the year of 1999–2000. Despite significant progress made globally throughout the decade, concerns were raised regarding 113 million children, who still did not have access to primary education.

The Dakar framework highlighted that, 880 million adults were illiterate, gender disparity in education continued to be a daunting fact, and principles of basic education were not being met, wherein adequate skills and knowledge necessary for gainful employment and full participation in society, was not being imparted.

Hence, the Dakar framework set six goals:

1. Expanding and improving early childhood education and care with a special focus on the children in vulnerable conditions.
2. By 2015, all children to have access to and complete primary education of good quality and for free of cost. Priority accorded to girls and children in difficult circumstances and ethnic minorities.
3. Learning needs of all young people and adults should be met through like-skills programs and equitable access to appropriate learning.
4. Adult literacy—50% improvement by 2015, especially for women.
5. Eliminating gender disparities in primary and secondary education by 2005 and, to target gender equity in education by 2015.
6. Improving all aspects of the quality of education and ensuring excellence for all, so that recognized and measurable learning outcomes are achieved by all, especially in literacy, numeracy, and essential life skills.

In order to achieve these goals, the framework pledged the following strategies:

1. To enhance investment in basic education by developing national action plans.
2. EFA policies to be linked with poverty elimination and development strategies.
3. Participation of civil society in the formulation, implementation, and monitoring.
4. Developing accountable systems of educational governance and management.
5. To implement strategies for gender equality in education.
6. To enhance the status, morale and professionalism of teachers.
7. To harness information communication technologies in education effectively.

Local response to MDGs in India: reducing gender disparity

One of the most enduring challenges to attain a goal of universal elementary education in India is of gender equality. Since independence all the important policy documents and programmatic interventions have set the target of achieving equity and equality in educational outcomes for boys and girls. Many efforts have been put in through initiatives such as Mahila Samakhya Program, District Primary Education Program, Shiksha Karmi project of Rajasthan and Kasturba Gandhi Balika Vidyalaya (KGBV), National Program for Education of Girls at Elementary Education (NPEGEL)—to name a few. Reducing gender disparity in education has been the national priority, especially post 1990s EFA targets and the Millennium Development Goals (MDGs). The achievements made during last few decades were, although impressive, still far from the ideals of equality. There are socio-cultural aspects which are deeply embedded which perpetuates heterogeneous gendered realities and economical-political aspects, which creates multiple disadvantages for women and girl child to complete their schooling, higher education and actively participate in democratic process and contribute to the economic development.

There are some critical aspects, such as systemic constraints, pedagogic issues and social factors, that poses multiple challenges for women in the educational processes. Culture plays important role in educational access. Traditionally the Indian women were prohibited from any form of formal or religious education. Learning domestic chores and nurturing the children are seen as the education for girls. Traditionally, her position is vulnerable and powerless due to patrilocal residence, patrilineal descent and exclusion from inheritance of the property. In case of economic constraints, education of the boy was preferred over girl child, as the girl will get married and leave the home, whereas boys will take care of parents in old age. Child marriages has also been detrimental for excluding girls from educational process. But these practices are not uniformly applicable, different communities in different states indicates differential proportion in education and participation in the workforce.

Some of the important initiatives that the Indian government has launched to improve educational access for girls are:

- To ensure universal access, community mobilization has been important strategy in all programs/schemes/initiatives to improve enrollment rates.
- Reservations of women in village education committees, School Management committees and Panchayati Raj Institutions (PRIs) have been provided.
- Efforts have been made to improve number of female teachers, and large number of non-formal and special schools (for example, Kasturba Gandhi Balika Vidyalayas KGBVs¹) have been established for out of school girls.
- Different bridge courses, vocational courses have been included in the school curriculum.
- Through different incentives such as free uniforms, textbooks, stationary and through different awards and scholarships girls are encouraged.

It has been observed that if the schools are easily accessible and functioning well then participation of girls improves, as demonstrated in National Program for Education of Girls at Elementary Education (NPEGEL) wherein providing girls with cycles resulted into reducing drop-outs, improved attendance and levels of learning (Ramachandran, 2009). Similarly, making educational content and pedagogic practices gender sensitive, reducing stereotypes in training of teachers have led to improved learning outcomes for girls.

Girls' enrollment started improving at a greater pace in the decade of 1990s and this growth is directly associated with the establishment of new schools under various flagship programs, centrally sponsored schemes and through various NGOs. However, participation of girls from Scheduled Caste, Scheduled Tribe, Other Backward Classes and minority communities such as Muslims is much lower. The transition rates from primary to upper primary and upper primary to high school levels reveals even more worrisome situation. 28.57% girl's dropout before completing primary education, 52.32% dropout before elementary level and 62.69% of the girls drop-out before secondary education. The drop-out rate for the girls from SC and ST communities are approximately 10%–20% more than the national average respectively (Ramachandran, 2009). Through concentrated efforts of linking completion of primary education with successful grade specific achievements in upper primary stages and access to secondary schools, vocational courses providing the opportunity of self-employment, drop-outs could be reduced.

Early childhood care and education (ECCE)

This section will provide an overview of more flagship initiatives of the Indian government, i.e., Mid-Day Meals, Balwadis and Anganwadis, in response to the MDGs mandate on- Early Childhood Care and Education. Early Childhood Care and Education (ECCE) is a significant area of importance, as increasing empirical evidence points to the value that providing pre-school experience to children not only improves their readiness for school but also meets their basic growth and developmental needs.

The field of neuroscience has provided substantial evidence that "experience-based brain development in the early years sets neurological and biological pathways that affect health, learning and behavior throughout life" (Young and Richardson, 2007). Along with physical development, other important capabilities such as cognitive, social, and psychomotor competencies develop in the critical periods in the early years of life. With the stimulating and enriching physical and psycho-social environment, the chances of a child's brain development to its full potential are considerably higher leading to later success in life. Contrarily, if such a nourishing and stimulating environment is lacking in the early phases, there are irreversible impacts on the development of the child. As a result, many children from families with poorer economic conditions, by the time they reach school age, are at significantly disadvantageous position compared to other children in terms of social and cognitive ability (Kaul and Sankar, 2009).

"Expanding and improving comprehensive early childhood care and education, especially for the most vulnerable and disadvantaged" was the first goal stated in the Dakar Framework for Action UNESCO (2000). ECCE can be classified into the sub-stages of:

- (a) Prenatal to two and a half to three years.
- (b) 3–4 years.
- (c) 4 to 5/6 years.

In the first sub-stage of ECCE, which is from prenatal to 3 years, the most significant aspect is to provide adequate provision for health and nutritional wellbeing. This stage of life is the most vulnerable to proper physical growth and brain development. In this stage, it is important to pay adequate attention to parent counseling in nutrition and health education and in "early psycho-social stimulation" by following the home targeting approach.

In the next substage which spans from 3 to 4 years, the important aspect to cater to is early learning in an organized manner. For this purpose, the Early Childhood Education and Care (ECCE) program recommends the learning facilitated through a center-based

¹The KGBV scheme was launched in the year 2004 (and brought under the umbrella of SSA from 2007) for girls belonging to SC, ST, OBC or minority communities and girls from families below poverty line. KGBVs are residential schools till grade VIII, but some states have introduced higher grades also. As on 2015, there are over 3600 KGBVs in 460 districts from 27 states, which have low female literacy rates (NITI Aayog, 2015). The context and location specific nature of this scheme has been instrumental in reaching out to the girls situated where day schools could not.

approach using the play method. In the third substage from 4 to 6 years, school readiness elements are introduced in a structured approach (Kaul and Sankar, 2009).

The earliest formal documentation of preschool/early childhood education, the first government initiative in India was Central Social Welfare Board in 1953, which started as a grant-in-aid scheme for voluntary agencies (Kaul and Sankar, 2009). Gijubhai Badheka and (later joined by) Tarabai Modak the pioneers of ECCE in India; they established the first Montessori school in India in 1920 at Bhavnagar in Gujarat and together prepared material for teachers and started a training college for preschool teachers (Early Childhood Care, n.d.).

In 1975, one of the world's largest and unique program was launched i.e., the Integrated Child Development Services (ICDS) for early childhood care and development. Objectives of this scheme were to reduce malnutrition, morbidity, reduced learning capacity and mortality of children in the age group of 0–6 years, pregnant women, and lactating mothers (Ministry of Women and Child Development, 2009). Another significant landmark was the 86th Constitution Amendment Act (2002) which committed to the provision of “free early childhood education and compulsory education for children up to 14 years of age”.

Some of the important policy initiatives in India for strengthening ECCE are following: National Nutrition Policy (1993) identified children below 6 years old as high risk category; National Policy on Empowerment of Women (2001) made the provision for childcare facilities including creches at work place; National Plan of Action for Children (2005) set the target of universalization of ECCE and National Curriculum Framework (2005) emphasized 2 years of pre-schooling as essential aspect for the holistic development of children (Kaul and Sankar, 2009).

In three decades from its inception, ICDS has been expanded to cover entire nation and the budgetary allocations (both state and external) have been increased significantly. According to the latest data available, in 2015 there were 1,346,186 Anganwadis (early childhood care center) in India providing preschool education to 36,543,996 children (Ministry of Women and Child Development, 2015).

However, there are some persisting challenges in the structure of implementation and the coverage of beneficiaries. One of the critical concerns is regarding the number of tasks that has been assigned to Anganwadi workers. It includes keeping the track of new births, of health indicators of infants and children till age six; to provide supplementary nutrition feeding for children, expectant and nursing mothers; to provide health and nutrition education to mothers, counseling to newly married couples on birth control/family planning; coordination with different institutions such as primary health care centers, schools and to assist in the implementation of different government schemes. The Anganwadi worker is also supposed to conduct pre-school activities for the children in the age group of three to six and educating parents on their role in child's growth and development (Ministry of Women and Child Development, n.d.). So, in practice, the ICDS services have been focusing on the “feeding” aspect rather than behavior change in the child caring practices. There are also limitations in the skill sets and educational levels that AWWs have, to be able to effectively implement ECCE and behavioral aspects at the grassroot level (Kaul and Sankar, 2009).

Balwadis and Anganwadis

The first Balwadi was established in 1945 by Tarabai Modak as a pioneer effort for tribal people's education and non-formal educational activity center for pre-school education at Bordi village in Maharashtra (Shukla, 2004). Since then, Balwadis and Anganwadis are accepted concept and approach to early childhood education. Modak's two types of Balwadis are (Shukla, 2004):

1. Central Balwadi: functions during regular school hours and are centrally located.
2. Angan Balwadi or Anganwadi: functions at the hours convenient for the children in their own localities.

The purpose of Balwadis is to provide basic and fundamental child facilities for physical and mental growth at home and outside (Bhattacharya, 2008). Thousands of Balwadis have been set up all over India by government and non-government agencies, for instance, many Balwadis are set up by voluntary organization like Kasturba Gandhi National Memorial Trust as well as developed as a part of the government of India's poverty alleviation program by universalizing education. Hence, today most of the pre-primary sector is largely covered by the Balwadis or Anganwadis, and the independent nursery schools or nursery schools attached to regular schools are very few (Abraham, 2011).

The limited impact of early childhood care in India is because “the staff running the ECCE program is the single most important factor in determining the quality of the program yet, it is the most neglected aspect of the program” (Abraham, 2011). The teachers at this level are not merely imparting education but they are responsible for holistic care of a child, and yet most of the nursery teachers employed in Balwadis or Anganwadis are trained for a very short duration and the training has been mostly inadequate. But a ray of hope is in the National Education Policy (2020) where the government has proposed to train the current Anganwadi workers into high-quality ECCE teachers (Kulkarni, 2020).

Midday meal scheme (MDM)

Provision of school lunches is an old concept in India. Even before its independence, Madras Municipal Corporation was giving meals to disadvantaged children. In post-independence India, by the 1990s most of the states were providing school lunches or food grains to the children in primary grades through their own exchequer. The National Program of Nutritional Support to Primary

Education (NP-NSPE) was launched in 1995 as a centrally sponsored scheme with twin objectives—to enhance enrollment, retention and attendance; and to enhance nutritional standards of children in primary classes, through the provision of free food grains to the children in primary grades. In subsequent years, this program was expanded to all the block of the country and the coverage was expanded to include the children till grade VII (Ministry of Education, n.d.). This is the largest school feeding program in the world reaching out to over 120 million children in the country.

Implementation challenges

Although this scheme promised cooked meal, some states failed in this arrangement and instead, provided students with monthly dry ration based on their attendance in school until 2001 when the supreme court issued an interim order directing states to introduce mid-day meal in all public schools and to provide a minimum content of 300 calories and 8–12 g of protein each day of school for a minimum of 200 days (Sahai, 2014).

This was an important step toward promoting universalization of primary education in India. This scheme specifically targeted children belonging to economically poorer and socially vulnerable groups. The positive co-relation between provision of school feeding programs and enrollment rates, is evident in many developing countries (Jayaraman and Simroth, 2015). In their large-scale study on the impact of the mid-day meal scheme on primary school enrollment in India, Jayaraman & Simroth found that school enrollments increased by 13% between the years 2002 and 2004. This corresponds to additional 2.4 million children in school. Although, this increase is largely driven by enrollments in grade one, the study indicated that mid-day meal resulted into 7% reduction in out of school children in the age group of 6–10. Mid-day meal scheme has also provided safety net to raise the nutritional intakes among children, especially in the draught-stricken areas (Singh et al., 2014).

Despite its significant achievements, the effectiveness of this scheme has challenges: sometimes in the transportation to the rural areas, the food grains get adulterated and pilfered in the delivery, and some schools do not have the facility or kitchen/storeroom/clean water to cook (Sahai, 2014). Some field studies have also reported that there have been instances of caste-based discrimination in the provision of mid-day meal with regards to food cooked by *Dalit* (Scheduled caste) cooks (Khera, 2006). Another important concern is regarding the quality of the food and maintaining nutritional standards as prescribed in the guidelines (Shukla, 2014).

Conclusion

India has reduced poverty and hunger by half (MD Goal 1), achieved gender parity in primary school enrollment (MD Goal 3), reduced maternal mortality by three-quarters (MD Goal 5), however there is still need of improvement in achieving universal primary school enrollment and completion and, achieving universal youth literacy (MD Goal 2) according to the UN India report by Economic and Social Commission for Asia and the Pacific (UN India, 2015). India's progress in achieving the MDGs has been significant considering it being a developing country with 1.3 billion population. Yet a lot more needs to be done to attain the global goal of education for all as a human right. From the above discussion, it becomes clear that existing local histories-inequalities and discriminatory attitudes can cause major barriers for policy translation and implementation, just as structural adjustment policies connected to external aid.

The Sustainable Development Goal (4) has further strengthened the educational agenda by making governments pledge to “ensure equitable quality education and promote lifelong learning opportunities for all”. According to UNDP India, although India made substantial progress in achieving the EFA and MDGs' universal primary education through national initiatives such as Right of Children to Free and Compulsory Education Act (2009), the quality of education, out of school children and school drop-outs are major challenges, particularly among the children in rural areas and belonging to minority communities (UNDP, 2015). The integration of SDG 4 in the New Education Policy 2020 aims for positive impact on achieving inclusive and equitable quality education in India. SDG 4 claims to do the “unfinished business’ of the EFA agenda and the education-related MDGs” (UNESCO, 2016, p. 7). Strong political will, well-targeted interventions and resources are required to fulfill this “unfinished business”. Scholars have already raised alarm about the domination of “development” thinking during the era of MDGs through growth paradigm that has increased inequalities and environmental exploitation. It has been argued that it is necessary to spread awareness about development paradoxes and encourage alternative methods to educate for promoting sustainable development- SDGs through indigenous learning, ecopedagogy, and empowerment education (Kopnina, 2020). Hence, the success of Sustainable Development Goals (SDGs) and specifically, SDG 4 (pledge to achieve quality education for all) will once again depend on how this global policy mandate is translated and implemented within local contexts.

Introduction

The fate of our futures has been increasingly tied to the prospects of educational change and advancement. From its entrance into the post-World War II era's incarnation of modernity that envisioned a more unified world, albeit one that is western defined and led, education has gained prominence as a human right. Subsequent education-specific initiatives—including Education for All (EFA), the Dakar Framework, the Millennium Development Goals (MDGs) 2 and 3, and Decade of Education for Sustainable Development 2005–2014—have cemented education as a legitimate stakeholder in development discourses (Wulff, 2020). The new Sustainable Development Goals (SDGs), the global successors to the MDGs, have roped-in education more tightly for a seemingly more integrative role in the United Nations' "plan of action for people, planet and prosperity" and "to strengthen universal peace in larger freedom" (United Nation, 2015, p. 1). In fact, the Incheon Declaration, a declaration on education adopted at the World Education Forum in 2015, proclaims Sustainable Development Goal 4 (SDG 4 henceforth), *Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all*, the "unfinished business" of the EFA agenda and the education-related MDGs" (UNESCO, 2016, p. 7). The vision that is promoted through SDG 4 "is to transform lives through education, recognizing the important role of education as a main driver of development and in achieving the other proposed SDGs" (UNESCO, 2016, p. 7).

This article presents the core principles contained in SDG 4 and critically interrogates the values embedded in them, as well as assesses practical issues of relevance and implementation. The paper unfolds in the following manner: the next section briefly examines the emergence of SDG 4 out of MDG 2 and 3, as well as the basic structure and content of SDG 4. The section after this discusses the positive aspirations of SDG 4, noting how education is framed to advance its key Target by itself and in support of the overall SDG framework. The final section addresses some of the deep detractions of SDG 4, in particular its embedded values and how they may hinder some of the potentially liberatory goals of education. The paper ends with a brief conclusion that summarizes some of the key points.

Background to SDGs and SDG4

The Sustainable Development Goals (SDGs) succeeded the Millennium Development Goals (MDGs) which consisted of 8 Goals that were established for the period 2000–2015 geared toward addressing development problems of the Global South. The MDGs contained two education-related goals: Goal number 2 "To achieve universal primary education," and Goal number 3 "To promote gender equality and empower women." A common view is that while the MDGs did help create a global focus on development issues, there were significant flaws in their initial construction, focus, implementation and achievements (Hulme, 2009; Fehling et al., 2013). Among the more common detractions of the MDGs, they were described as "being created by only a few stakeholders without adequate involvement of developing countries and overlooking development objectives previously agreed upon" and being "unachievable and simplistic, not adapted to national needs, [did] not specify accountable parties and reinforce[d] vertical interventions" (Fehling et al., 2013). Yet others point to some important achievements. Ban Ki-Moon, then UN Secretary General, said the MDGs "produced the most successful anti-poverty movement in history," and "helped to lift more than one billion people out of extreme poverty, to make inroads against hunger, to enable more girls to attend school than ever before and to protect our planet" (p. 1109). He added that the MDGs "generated new and innovative partnerships, galvanized public opinion and showed the immense value of setting ambitious goals" (United Nations, 2015b). Specifically related to the education goals, MDG Goals 2 and 3, their achievements are cited to include:

- Enrollment in primary education in developing regions reached 91% in 2015, up from 83% in 2000.
- Among youth aged 15–24, the literacy rate has improved globally from 83% to 91% between 1990 and 2015
- The gap between girls/women and boys/men has narrowed (United Nations, 2015c).

However, the MDGs' educational failures were also seen as consequential; for instance the [United Nations \(2015b\)](#) points out that there continue to be "large disparities in primary school enrollment, and the poorest and most disadvantaged children bear the heaviest burden" (p. 26). Increased enrollment did not necessarily translate to learning (an issue of quality), and while the gender gap had narrowed under the MDG 3 as evidenced by improved gender parity, equal treatment and learning outcomes were still problem areas. Importantly, too, the MDGs were silent on several marginalized groups ([Wulff, 2020](#)). Additionally, the combination of over-crowded, underequipped classrooms and unqualified teachers also reproduced patterns of inequality and exclusion, thus limiting the progress of the MDG Education goals ([Wulff, 2020](#)). The SDG 4 was supposed to address these MDG failures and tackle other challenges. In fact, the *The Millennium Development Goals Report 2015* framed the task of the SDGs in this way:

Drawing on lessons learned from the MDGs, interventions will have to be tailored to the needs of specific groups of children—particularly girls, children belonging to minorities and nomadic communities, children engaged in child labor and children living with disabilities, in conflict situations or in urban slums. Investing in the quality of education and ensuring a sustainable source of funding are also essential.

[United Nations \(2015b, p. 27\)](#).

The SDGs emerged "out of the much wider agenda [than] the MDGs and evolved out of a hugely interactive process of meetings, lobbying and advocacy at every level, national, regional and international" ([King, 2016](#), p. 18). These new Goals were more global than the MDGs which were largely designed with a focus on developing countries. The SDGs promised to eradicate global poverty, fight inequalities and tackle climate change through the multipronged approach of achieving 17 integrated goals and 169 targets covering social, economic, and ecological issues the world faces today. There was a markedly different tone and process of designing the SDGs in important ways compared to the MDGs, which were developed by a small group of Westerners ([Hulme, 2009](#)). Thus, a fundamental difference between the SDGs and the MDGs is the adoption of a more "participatory" approach to developing the Global Goals. One of the initiatives that preceded the SDGs was "The Future We Want," a declaration that specified the need for greater inclusion of civil society and marginalized populations universally in the creation of global development policies. The UN also produced "A Million Voices," a document that reflected input from governments, think tanks, NGOs, civil society, and academics regarding their aspirations for the post-2015 development framework. Additionally, the UN launched the "My World Survey" which allowed individuals across the globe to vote online for the top six issues they wished to see in the SDGs. These apparently more participatory initiatives, drawing from multiples sources, are different from the policy formulation process for the MDGs, which was left solely in the hands of a small group of UN experts ([Hulme, 2009](#)). Yet, even with this seemingly more open system of contributing to and developing the SDGs, some, like [King \(2016\)](#), suggest it is important to ask questions about who had final control over how the texts were edited, and who took decisions on the education targets. [McGrath and Nolan \(2016\)](#) also suggest that the highly technocratic process of indicator setting silences the voices of non-"experts" (p. 122). These issues are explored later in the paper.

Rhetorically, the SDG's participatory emphasis is evident in the language used in the initiative's framework, including references to various documents developed to shape the SDGs, such as "A Million Voices" and the "My World Survey". [United Nations \(2015\)](#) noted that "The Goals and targets were the result of over two years of intensive public consultation and engagement with civil society and other stakeholders around the world, which paid particular attention to the voices of the poorest and most vulnerable" (p. 3). Similarly, the Framework's emphasis on working "in a spirit of global solidarity" (p. 10), "embark[ing] on a collective journey" (p. 1) to ensure that "no one will be left behind" (p. 1 and 3), and adopting a "people-centered approach" (p. 3 and 8) makes clear the SDGs' effort to appear participatory and reflective of the needs of all populations, particularly "the poorest and most vulnerable" (p. 3). The SDG framework utilizes unifying rhetoric, stressing the importance of all countries playing their part to "free the human race from the tyranny of poverty and want to heal and secure our planet" (p. 1), and claims that "Never before have world leaders pledged common action and endeavor across such a broad and universal policy agenda" ([United Nations 2015](#), p. 18). On the surface then, by "involving" marginalized voices in the policy formation stages, by using unifying rhetoric, and by recognizing the role of governments in tailoring the SDGs to meet their own national contexts and realities, the SDGs appear highly participatory. This is the overall SDGs framework on which the SDG 4 is built.

The emergence and structure of SDG 4

[Wulff \(2020\)](#) notes that the inclusion of a stand-alone Education Goal was not a foregone conclusion when negotiations for a new development agenda began; instead, the SDG 4 Education Goal came about due to mobilization of the education community, allied with education's first level ranking on the "My World Survey." SDG 4 was designed with the intention of incorporating but also moving well beyond MDG 2 and 3 to take up important educational themes that were missing from these previous Development Goals. Thus, SDG 4 represents "a stronger and broader commitment to quality and equity in education" ([Wulff, 2020](#), p. 1) with individual targets that are much broader and covering areas that were absent from the MDG 2 and 3. Included in the SDG 4 are equitable access to primary and secondary education, early childhood development and pre-primary education, post-secondary/tertiary education of various forms, job-relevant skills, increased access for people with disabilities and other traditionally marginalized groups, adult literacy education, education for sustainable development, building of physical school facilities, increased scholarship abroad for higher education for students in low income countries, and increased teacher supply (see [Table 1](#)). Overall,

Table 1 Sustainable development goal no. 4, targets and indicators.

Outcome targets (4.1–4.7)	
Target 4.1	By 2030, ensure that all girls and boys complete free, equitable and quality primary and secondary education leading to relevant and effective learning outcomes
4.1.1	Proportion of children and young people (a) in grades 2/3; (b) at the end of primary; and (c) at the end of lower secondary achieving at least a minimum proficiency level in (i) reading and (ii) mathematics, by sex
4.1.2	Completion rate (primary education, lower secondary education, upper secondary education)
4.1.3	Gross intake ratio to the last grade (primary education, lower secondary education)
4.1.4	Out-of-school rate (1 year before primary, primary education, lower secondary education, upper secondary education)
4.1.5	Percentage of children over-age for grade (primary education, lower secondary education)
4.1.6	Administration of a nationally representative learning assessment (a) in Grade 2 or 3; (b) at the end of primary education; and (c) at the end of lower secondary education
4.1.7	Number of years of (a) free and (b) compulsory primary and secondary education guaranteed in legal frameworks
Target 4.2	By 2030, ensure that all girls and boys have access to quality early childhood development, care and pre-primary education so that they are ready for primary education
4.2.1	Proportion of children aged 24–59 months who are developmentally on track in health, learning and psychosocial well-being, by sex
4.2.2	Participation rate in organized learning (one year before the official primary entry age), by sex
4.2.3	Percentage of children under 5 years experiencing positive and stimulating home learning environments
4.2.4	Gross early childhood education enrollment ratio in (a) pre-primary education and (b) early childhood educational development
4.2.5	Number of years of (a) free and (b) compulsory pre-primary education guaranteed in legal frameworks
Target 4.3	By 2030, ensure equal access for all women and men to affordable and quality technical, vocational and tertiary education, including university
4.3.1	Participation rate of youth and adults in formal and non-formal education and training in the previous 12 months, by sex
4.3.2	Gross enrollment ratio for tertiary education by sex
4.3.3	Participation rate in technical-vocational programs (15–24-year-olds) by sex
Target 4.4	By 2030, substantially increase the number of youth and adults who have relevant skills, including technical and vocational skills, for employment, decent jobs and entrepreneurship
4.4.1	Proportion of youth and adults with information and communications technology (ICT) skills, by type of skill
4.4.2	Percentage of youth/adults who have achieved at least a minimum level of proficiency in digital literacy skills
4.4.3	Youth/adult educational attainment rates by age group and level of education
Target 4.5	By 2030, eliminate gender disparities in education and ensure equal access to all levels of education and vocational training for the vulnerable, including persons with disabilities, indigenous peoples and children in vulnerable situations
4.5.1	Parity indices (female/male, rural/urban, bottom/top wealth quintile and others such as disability status, indigenous peoples and conflict-affected, as data become available) for all education indicators on this list that can be disaggregated
4.5.2	Percentage of students in (a) early grades, (b) at the end of primary, and (c) at the end of lower secondary education who have their first or home language as language of instruction
4.5.3	Existence of funding mechanisms to reallocate education resources to disadvantage populations
4.5.4	Education expenditure per student by level of education and source of funding
4.5.5	Percentage of total aid to education allocated to least developed countries
Target 4.6	By 2030, ensure that all youth and a substantial proportion of adults, both men and women, achieve literacy and numeracy
4.6.1	Proportion of population in a given age group achieving at least a fixed level of proficiency in functional (a) literacy and (b) numeracy skills, by sex
4.6.2	Youth/adult literacy rate
4.6.3	Participation rate of illiterate youth/adults in literacy programs
Target 4.7	By 2030, ensure that all learners acquire the knowledge and skills needed to promote sustainable development, including, among others, through education for sustainable development and sustainable lifestyles, human rights, gender equality, promotion of a culture of peace and nonviolence, global citizenship and appreciation of cultural diversity and of culture's contribution to sustainable development
4.7.1	Extent to which (i) global citizenship education and (ii) education for sustainable development are mainstreamed in (a) national education policies, (b) curricula, (c) teacher education and (d) student assessment
4.7.2	Percentage of schools that provide life skills-based HIV and sexuality education
4.7.3	Extent to which the framework on the World Program on Human Rights Education is implemented nationally (as per the UNGA resolution 59/113)
4.7.4	Percentage of students in lower secondary education showing adequate understanding of issues relating to global citizenship and sustainability
4.7.5	Percentage of students in lower secondary showing proficiency in knowledge of environmental science and geoscience
4.7.6	Extent to which national education policies and education sector plans recognize a breadth of skills that needs to be enhanced in national education systems

(Continued)

Table 1 Sustainable development goal no. 4, targets and indicators.—cont'd

Means of implementation targets (4.a to 4.c.7)	
Target 4.a	Build and upgrade education facilities that are child, disability and gender sensitive and provide safe, non-violent, inclusive and effective learning environments for all
4.a.1	Proportion of schools offering basic services, by type of service
4.a.2	Percentage of students experiencing bullying in the last 12 months in (a) primary, and (b) lower secondary education
4.a.3	Number of attacks on students, personnel and institutions
Target 4.b	By 2020, substantially expand globally the number of scholarships available to developing countries, in particular least developed countries, small island developing states and African countries, for enrollment in higher education, including vocational training and information and communications technology, technical, engineering and scientific programmes, in developed countries and other developing countries
4.b.1	Volume of official development assistance flows for scholarships by sector and type of study
Target 4.c	By 2030, substantially increase the supply of qualified teachers, including through international cooperation for teacher training in developing countries, especially least developed countries and small island developing states
4.c.1	Proportion of teachers with the minimum required qualifications, by education level
4.c.2	Pupil-trained teacher ratio by education level
4.c.3	Percentage of teachers qualified according to national standards by education level and type of institution
4.c.4	Pupil-qualified teacher ratio by education level
4.c.5	Average teacher salary relative to other professions requiring a comparable level of qualification
4.c.6	Teacher attrition rate by education level
4.c.7	Percentage of teachers who received in-service training in the last 12 months by type of training

Modified from [UN Institute for Statistics \(2021\)](#).

improved quality and equitable access under a rights-based umbrella serve as underpinning principles of the SDG 4. Further, the notion of education for sustainable development attempts to make education a more cross-cutting theme relevant to the overall goal of sustainability the SDGs seek to convey, and tries to make education seem more integrative of the Goals (Wulff, 2020). SDG 4 has 10 targets, that is, specific, measurable objectives which are expected to contribute to achieving the overall goal (Outcome Targets range from 4.1 through 4.7, and Means of Implementation Targets are 4.a to 4.c.; see Table 1). There are also 11 global indicators and 32 thematic indicators, which are markers of change or continuity that are expected to enable the measurement of progress toward meeting each target set to achieve the broader education Goal. The indicators are spread across four monitoring levels—global, thematic, regional and national. UNESCO-UIS (2018) notes that global level monitoring provides a global overview of progress toward each target, while thematic monitoring compares indicators within a specific sector (e.g., education, environment, energy, health) or cross-cutting themes (e.g., gender) and serves as a framework to track progress on a cross-nationally comparable basis. For regional monitoring, countries are expected to develop and agree to a set of indicators, and consider priorities and issues of common and shared interests of a particular region. National level monitoring is linked to the needs of national and sub-national governments in developing education sector plans and informing policies.

Optimism and virtues of SDG 4

Like the Education MDGs, the Education SDG, even more so, “is a valuable resource for lobbying and advocacy by civil society” (King, 2016, p. 22; also see Dost, 2020). With a more expanded set of objectives, targets and principles, SDG 4 lays out a wider array of education-related aspirations to advance development and justice in the modern era. Compared to the MDG Education Goals, SDG 4 targets “are transformative in scope and ambition, and ... they have the potential to challenge some of the pervasive forces in education” and are intended to be implemented under a rights-based approach (Wulff, 2020, p. 3). The broader, more transformative nature of the SDGs has direct implications for education too, due to “their universality and pledge to overcome silos within sustainable development” (Wulff, 2020, p. 11) which translate into the prospect of a global effort to address educational needs and for education to be considered in relation to all other goals and targets in the overall SDG agenda. Also, SDG 4 is significant in its endorsement of education for sustainable development. Target 4.7 is specific in its aspiration that “all learners acquire the knowledge and skills needed to promote sustainable development, including, among others, through education for sustainable development and sustainable lifestyles ...”. Thus a notion of the “public good is implicit in the general SDG vision in which education is mentioned in targets for food security, women’s rights, decent work, health and equalities” (Allais et al., 2020, p. 135) and sustainable development. Additionally, because the SDGs overall are framed as Global in nature, the educational goals are more inclusive of marginalized people outside of the Global South compared the MDGs which were specifically designed for developing countries. By the principles of the SDGs being applicable to wealthy industrialized nations, as well, those pockets of educational inequities in “developed” countries should become subject to greater scrutiny and policy change under a global mechanism that has universal relevance.

The notion of inclusive education in the SDGs also takes more explicit forms under the umbrella of universal rights, for example, by “focusing on specific subgroups as target populations” such as “persons with disabilities, indigenous peoples and children in

vulnerable situations" (Johnstone et al., 2020, p. 97) as described in target 4.5 of Goal 4. Additionally, Goal 4 names other groups in various targets, including girls, rural children, students from developing countries, and small island developing states (SIDS) as educational rights bearers. Critically, indicators (as listed in 4.5.1) are attached to these targets that require member states to collect and provide data, which potentially creates an environment of verifiability and accountability and therefore accords rights of inclusion to various historically marginalized groups. As Johnstone et al. (2020) note, such rights are plural in the sense that they are "concerned with the presence, participation, and achievement of all children and particularly with educational needs of populations that have been historically marginalized" (p. 98). In real world context, Do et al. (2020), drawing on case study and evidence from Vietnam, conclude that these key rights-based elements in SDG 4 "can satisfactorily ensure the legal rights of ethnic minorities" (p. 15). Their study further note that by "... targeting substantive equality, these [aspects of SDG 4] resolve long-existing conflicts in equality law, while still focusing on human rights for underrepresented groups" (Do et al., 2020, p. 3), by offering concrete and relevant interventions for vulnerable groups to take place.

Another important aspect of SDG 4 is its movement of the education discourse beyond mere enrollment to one of learning outcomes and educational achievement. With this "quality turn," as Sayed and Moriarty (2020) refer to it, SDG 4 has brought about a focus on the quality of educational experiences compared to previous educational initiatives. The implication of SDG4's more qualitative focus is an "education in which one concentrates on each and every child as a whole, development of each student as social, emotion, mental, physical and cognitive irrespective of sex, gender, race, caste, religion, status and geographic location" (Rajput et al., 2020, p. 104). And because SDG 4 focuses on "learning as opposed to access to education" (212) and "not just as an overarching goal but embedded in the target" (Sayed and Moriarty, 2020, p. 195), notions of educational relevance, resource support, teacher quality, financing, among other educational issues, are forced to be parts of broader educational policy and planning. In this context, the promotion of lifelong learning also emerges as a key principle in SDG 4, going farther than the focus solely on universal primary and secondary education as was the case with the Education MDGs. With SDG 4, educational policy and practice agenda is extended from formal basic education to tertiary-higher education and continued learning and retooling for continued relevance of skills for the 21st century economy. The inclusion of higher education in SDG 4 is seen as a progressive development, keeping in mind that this level of education has traditionally been absent from previous education development initiatives, including the MDGs (Allais et al., 2020). It is noteworthy, too, that the often-limited educational capacities at the tertiary educational level in developing countries is recognized, and are support by international cooperation between developed and developing countries, and international scholarships as described in Target 4.b and Target 4.c. Here, there is a specific target to "substantially expand globally the number of scholarships available to developing countries" (4.b) and "substantially increase the supply of qualified teachers, including through international cooperation for teacher training in developing countries" (4.c).

The limits and liabilities of SDG 4

Like the SDGs overall, SDG 4 mirrors some of the very challenges, tensions and contradictions of Western modernist development and global public policy/governance. As it relates to the former, modernist development is subject to critique of being a Western led universalizing agenda with notions of imperialism where powerful industrialized countries set and dominate the international development agenda (Klak, 1998; Nisbet, 1980). In such a system, as many critical scholars will point out, there are power imbalances that define historical and existing relations globally and locally, which impinge on who shapes the dominant development discourse and impacts what rights and responsibilities emerge (Dost, 2020). Specifically with regard to SDG 4, Wulff (2020) suggests that because its contents were "agreed to by those in power in 2015, the agenda was bound to reproduce the power relations and imbalances of that time" (p. 2) (see also Dost, 2020; King, 2016). Likewise, differences in "level of development," regional, national and local priorities, as well as culture, religious beliefs, among other issues, create tensions and potential divergences from Globally set educational targets. With regard to the issue of global public policy and governance, global development goals and initiatives, like the MDGs and the SDGs, must contend with the complexities and tensions of pursuing international cooperation in the context of national sovereignty and multiple development actors with different interests and varying levels of power (Stone, 2008; Barnett and Duvall, 2018; Marshall, 2013; Dost, 2020). Though the framers of SDG 4—including governments, international organizations, non-profits organization, and civil society—claimed to have been deliberate in their efforts to make the Goals seem participatory in its formulation, content, implementation and monitoring and evaluation, different stakeholders have highlighted crucial challenges in the development of SDG 4.

One such challenge is that even though the SDG framework recognizes "different national realities, capacities and levels of development" and respects "national policies and priorities" (United Nations, 2015a, p. 21), the Western universalist nature of the Goals creates contradictions, tensions and inconsistencies between global and national (and regional) educational policy priorities (Ali, 2016). For example, when countries already have educational and regional plans that have been negotiated at every level but which do not consistently align with SDG 4, problems and tensions of various kinds can emerge, including a pressure to change national priorities through various forms of coercive global governance mechanisms including international aid (Ali, 2016; King, 2016). As Ali (2016) highlights by drawing on the context of the Sindh Province of Pakistan where the long negotiated Education Sector Plan is "being undermined by the new exigencies of SDG-4 Targets," educational planning becomes very difficult by the donor community who "continue to come with their own priority areas ... with money attached to these priorities" (Ali, 2016, p. 58). Where national priorities do take precedence, the notion of Global goals might not be so global after all, which may render the cost and effort of monitoring and evaluation SDG 4 at the global level for universality futile. Also, when there are such differences

between national and global educational goals, monitoring and evaluation become challenging and the efficacy of the SDG 4 cannot be truly assessed. This problem also reflects three broader methodological challenges of measurement and comparison of goals at the global level as cited by UNESCO Institute of Statistics. The first is that “national, regional and global data on basic competencies in literacy and numeracy are frequently collected but cannot be used in an integrated manner to create a global picture of learning” (UNESCO-UIS, 2018, p. 23). What this means is that different countries (or regions) use different assessment mechanisms rendering cross comparison of countries difficult or meaningless. Secondly, there is no shared technical standards to ensure data are of similar quality at national and regional levels. And third, is the challenge of taking into account the multiple viewpoints related to “what can and should be measured globally,” thinking of “how national and regional data can help inform global measurement,” and “striking an appropriate balance between global competencies and the role of local influences” and education goals (UNESCO-UIS, 2018, p. 23).

However, the most vociferous and consistent detraction of SDG 4 are the values that are embedded within the educational paradigm that the Goal endorses and is built on, which reflects some of the core Western visions of the world. A fundamental critique is that SDG 4 conforms to the same paradigm as that which has existed within the dominant modernist development agenda, which itself is built on colonial notions of coercion, hierarchies and universalism that favor Western ways and ideas (Sterling, 2016). For instance, SDG 4 is interpreted as fundamentally instrumentalist to the Western economic model, and committed to economic growth and therefore all other social, political, cultural and environmental imperatives are rendered subservient to the economic imaginary (Brissett and Mitter, 2017; Sterling, 2016). This adherence to the traditional development paradigm creates internal contradictions within SDG 4, because while it promises to liberate the world’s dispossessed and marginalized peoples, its theory of change seems to be based on the very educational systems that have supported capitalist, growth-driven consumerism that have created inequities, and ruined societies and their natural environments in the first place (Komatsu and Rapple, 2018; Dost, 2020). Rather than connecting various forms of human existence, education in the SDGs is primarily framed as education for employment, which reduces much of education’s potential liberating and transformational effects.

With regard to the environment specifically, the unquestioning of the current education paradigm results in the continued prioritization of economic growth over the environment (Komatsu et al., 2020). For example, there is no obvious recognition of the fact that countries having “better” education also have more detrimental impacts on climate change, or the fact that the world is the “most educated it has ever been and yet the nearest to environmental breakdown” (Komatsu and Rapple, 2018, p. 7), which suggests that there is a deep and fundamental flaw in the values embedded in existing educational model that SDG 4 is attempting to expand. Yet there is little attempt to interrogate and critically reconsider the existing model of education, and there is only anemic attempts to explore whether all education consistently support sustainable development (Komatsu and Rapple, 2018). As Sterling (2015) observes, while Goal 4 emphasizes education in terms of its potential socio-economic benefits, there is no recognition that education through awareness raising, training and capacity-building can help protect environmental quality and lead to wiser resource use. In fact, SDG 4 is seen by some as paying mere lip service to education for sustainable development by lumping it together with so many other topics in Target 4.7 that the focus on education for the environment is diluted (Sayed and Moriarty, 2020, p. 2121). Therefore, while SDG 4 was supposed to be a core clarion call for education to play crucial role in environmental preservation, its advent has not changed education’s “business as usual” approach and is therefore still in need of radical transformation itself for greater impact on sustainability.

As explored earlier, it is welcomed that SDG 4 is more ambitious than the education MDGs by expanding its focus on educational levels and framing quality education beyond mere access to schooling. However, even with these expansions to the educational agenda, “the concept of quality education and learning is narrowed and reduced in instrumental ways that reduce its potential reach and impact” (Sayed and Moriarty, 2020, p. 212). For example, definitions of indicators of quality seem more technicist and narrow and not sufficiently clear on what constitutes quality learning, particularly in defining how education should change behavior (that is, education’s affective component). There seems to be some acknowledgment of this concern, as in 2019, UNESCO (2019) conducted a study that “examined whether, and to what extent, three learning dimensions,” that is the cognitive, social and emotional and behavioral, “are prioritized in commitments to Education for Sustainable Development (ESD) and Global Citizenship Education (GCED) learning in pre-primary (PPE), primary (PE), lower secondary (LSE) and upper secondary (USE) education in a selection of countries from UNESCO’s five regions of the world” (p. 7). The study found that “the relative emphasis on each of the three interrelated learning dimensions varies across education levels and across countries, reflecting specific contexts, systems, and needs,” leaving UNESCO to encourage stakeholders to “pay more attention to [these] three learning dimensions” (p. 9).

Critics also add that there is a distinct quantitative bias of SDG 4 indicators and this advantages those characteristics of educational quality that are readily amenable to quantitative measurement; qualitative indicators that are more reflective of changed behaviors, perceptions, and people’s experiences and emotive responses to education are suppressed. Wulff (2020) also highlights the “narrow implementation of the Broad Commitment of Quality” (p. 21) by the disproportionate focus on measuring learning outcomes primarily in the areas of literacy and numeracy while other subjects and dimensions of quality are marginalized. Further, the narrow universal focus on quality as measurement of numeracy and literacy, along with its attendant narrow set of data points, pushes education “toward global convergence and denies the importance of contextually relevant education” (Wulff, 2020, p. 22). As a result, what is considered valuable knowledge becomes standardized regardless of context, and learning is narrowed and reduced to market-productive human capital foci. Some observers have also raised SDG 4’s non-engagement with the issue of language of instruction as a problematic education quality issue that should have been addressed by the Goal 4 (Milligan et al., 2020). Milligan et al. (2020), for example, cite voluminous research showing that language of instruction is central to learning

and therefore a key component of educational equity, given that “so many children around the world learn in a dominant language, often which is not their own for example colonial language or non-indigenous language” (p. 120).

An important component of SDG 4, like all the other Goals, is verification of their progress and effects through monitoring and evaluation and, as such, the Goals are heavily dependent on data collection. Some characterize this process as “standardization” and “datafication” of education that have now found their way into SDG 4 based on the assumptions that processes of teaching and learning can be standardized and used to measure the performance of students, teachers and overall education systems, regardless of context (Wulff, 2020; Sellar and Hogan, 2019). In addition to this reductive use of data, data collection can be expensive and this has increasingly become a critical challenge, especially for developing regions with limited data gathering infrastructure and tradition (Johnstone et al., 2020). This has the potential to pull already limited resources from important educational areas in order to satisfy data gathering requirement of the SDG 4, which may not necessarily advance key educational and equity goals. In fact, UNESCO (2020) in its *Global Education Monitoring Report 2020* cites problems of data collection and note that many countries still struggle to collect meaningful data, especially for inclusion of educationally disadvantaged populations. SDG 4’s preoccupation with certain types of standardized data also invites a gendered critique. Durrani and Halai (2020), for instance, note that SDG 4’s reliance on and preoccupation with measurement and international ranking “often misses the most important aspects of gender equality because those aspects cannot be quantified” (p. 94). Thus, the Education SDG is said to “reproduce colonial gender hierarchies, including gender binaries” where the most marginalized are often the most invisible social groups due to the nature of standardization and datafication of education (Durrani and Halai, 2020, p. 93).

Another consequential component of SDG 4, also related to monitoring and evaluation and accountability, is how the Goal will be financed. One irony that some have cited is that even though SDG 4 is much broader and more ambitious than the Education MDGs, commitment to resourcing the former has gone down from the recommended 6% of GDP to a more flexible range of 4–6% and from 20% of national budget to 15–20% (Archer and Muntasim, 2020; Wulff, 2020). However, it is estimated that at least \$39 billion of aid was needed annually to achieve just some of the main SDG 4 targets (King, 2016). The disappointing outcome of the Financing for Development (FfD) conference in Addis Ababa in 2015 that should have supported the development agenda, including SDG 4, is significant (Brissett, 2018; Archer and Muntasim, 2020). With the continued and even further diminishing budgets of developing countries, the SDG 4 framework has promoted public-private partnerships (PPP) as a solution to fill the wide financial gap of the education targets. However, scholars and activists are wary of the profit motive and market logic, as well as the reductive and instrumental view of education, that emerge when private interests shape education, and they worry about the privatization forces on equity and equality (Rizvi and Lingard, 2010; Wulff, 2020; Archer and Muntasim, 2020). There is genuine concern that as the market logic influences SDG 4, through such public private partnerships, private interests might “capture public funds to support commercial interests, whose long-term effects could be deeply damaging to quality, equality and the public good” (Draxler, 2020, p. 168).

Conclusion

The SDGs emerged out of a much wider agenda than the MDGs and were more participatory in their development. Education has taken an important place in the SDGs after initial doubts that it would have a designated place in the new global development agenda. Replacing MDG 2 and 3, SDG 4 expanded on these Goals to include equitable access to primary and secondary education, early childhood development and pre-primary education, post-secondary/tertiary education of various forms, job-relevant skills, increased access for people with disabilities and other traditionally marginalized groups, adult literacy education, education for sustainable development, building of physical school facilities, increased scholarship abroad for higher education for students in low income countries, and increased teacher supply. The prospects of SDG 4 rest on its claim of a rights-based approach, which underpins its more inclusive tone compared to the Education MDGs. SDG 4, therefore includes its widened capacity as a resource for lobbying and advocacy for education, and the adoption of a more elongated interpretation of education with a focus on lifelong learning to tertiary educational levels. But particularly important is the greater focus on quality education beyond mere access and enrollment, as well as its heightened, more deliberate focus on historically marginalized groups, including people with disabilities, indigenous peoples and children in vulnerable situation, among others.

However, SDG 4’s rights-based approach is juxtaposed with an instrumentalist approach where education, fundamentally, is built to support a particular economic model. As such, SDG 4 suffers from an internal struggle between a broader rights-based conceptualization and the instrumentalist approach to education. This latter approach generates limitations of SDG 4 that are similar to problems associated with the Western modernist development model of universalism and inequitable power relations, as well the challenge of global public policy making in a context of sovereign nations and multiple interests. Among the challenges emerging from SDG 4 in this context are the tensions between the SDG 4 Targets and those in countries and regions. However, most problematic are the fundamental values that some see embedded in SDG 4, particularly its commitment to the existing model of education that has historically supported what many believe to be a flawed economic system that has exploited people, societies and the environment. Thus, another central critique of SDG 4 is the lip service paid to education for the environment; many observers have noted the limited systemic integration of types of knowledge and learning that truly raise the natural world above its existing position of a consumable resource. And this critique is also tied to the degree to which some see SDG 4 as adhering to its rhetoric of quality education; here, questions are raised about how quality education is assessed due to the Goal’s bias toward standardization and datafication which limit the emergence of educational issues that are qualitatively important but not amenable to easy

quantification. These concerns are also extended to the extensive monitoring and evaluation necessary for SDG 4 and the associated costs. These above challenges are capstoned by the lack of financing for the SDG 4.

However, many laud these new global development Goals. And even with their challenges, there is still hope and, some would say, potential for the Education SDG 4 to serve and advance Global Citizenship and transform our world.

The Sustainable Development Goals scheduled for completion by 2030 stand as a beacon to the international community of a collective hope for quality life on the planet. They are especially important as we face enormous issues like climate change, migration and unbridle capitalism and globalization. Addressing each of the 17 goals is a challenge that has replaced the once equally bold, MDGs (UN, 2015) which ended unsatisfactorily in 2015. The 17 goals expand greatly the dreams of the 6 MDGs and show our collective energy and will to meet Agenda 2030. In Goal 4 and its ten targets, the UN (UNESCO, 2016) named its hope that it would “Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all”. This education or lifelong education goal became the focus of UN agencies like UNESCO which have heightened capacity in this area. However, they have not forgotten that the accomplishment of Goal 4 is deeply connected to all the goals, especially decent work (Goal 8), gender equality (Goal 5), poverty reduction (Goal 1), and health and well-being (Goal 3) (English and Mayo, 2019).

This chapter focuses primarily on Goal 4 and its targets as the way forward to reaching sustainability in 2030. A key piece of Goal 4 is that it is, unlike the MDGs which focused on children in school, inclusive of adult education. Despite the optimism of a lifelong learning approach, researcher Elfert (2019) offers a caution to the hope for adult education found in the SDGs. Her careful appraisal draws attention to the overall global prioritization of the education of children, the general lack of funding for adult learning and education, and the negligible interest in educating marginalized groups. Her analysis is clear and convincing, and supported by robust data. Yet, Goal 4 and the other 16 SDGs are the planet’s best means of fulfilling its global commitment to sustainable development. Education bears a major responsibility and is arguably, due to its reach and its centrality in the global knowledge economy, the main goal.

Goal 4 on education is the key goal in addressing many world crises, especially migration and the flows of people from country to country and state to state. The IOM reports that in mid-2019, the latest statistics, there were 271.6 million migrants (IOM, 2020). Yet, nations have failed to furnish comprehensive policies to welcome them and, more radically, change the unequal neocolonial relationship between North and South, the only way to really stem the tide of people leaving their homes to seek pastures new elsewhere. Education can constitute one of the contributory variables to change.

International pronouncements aside, even continents like Europe do not have a universal policy for immigration, let alone an educational one, for all the EU talk of LLL for employability and active citizenship. Each individual state is expected to create its own policies and responses, in part because the hope of coming to consensus is low. Within countries in Europe, for instance, the response to immigration has been mixed, especially in countries that faced situations of their empire striking back, not in Stuart Hall’s (Hall, 2017) sense of harkening to a sense of Empire but in the sense of victims of imperial politics seeking recourse to the former empire, and which have been witnessing the rise of Right wing, including Far Right, movements/parties (e.g. Lega Lombarda in Italy, UKIP and the BNP in Britain, the Vlaams Belang Party in the Flemish region of Belgium and the Front National in France) appealing to swathes of the “autochthonous” and even settled immigrant populations, the irony apparently lost on the latter. This mixed reception stands in sharp contrast to the EU’s hope for a Social Europe or the invocation of the long history of progressive social, economic and educational policy that is often generally attributed to Europe (Mayo, 2017).

European counties in the Mediterranean like Malta struggle to accommodate migrants, not only those who came in the waves of migrants in 2016 but those who continue to arrive, escaping inhospitable conditions in their countries of origin. Migrants are attracted, for the most part, toward the Eldorado, the image of the Western world as implanted by different means of colonial education. Even after the massive waves of migration in 2016–17, migration within and between countries and continents remains a crisis or, as in settler countries like Canada, a way of life. This country was colonized by the English and the French who came to live on Indigenous lands and it continues to welcome newcomers. Indeed, Canada continues to be a settler nation as about 20% of the population is foreign born, with the numbers much higher in cities like Toronto and Vancouver where the percentage is almost 50% (Statistics Canada, 2017). This country has a complex ethnic makeup and defines itself as multicultural, so immigration, migrants and refugees have been part of its history and its makeup, though it has a strict immigration policy that priorities skills and employability. This is also true of Australia (Webb et al., 2017). This system has its weaknesses, since many professional migrants are unemployed and underemployed. Canada struggles with social integration and employability, especially with the shift to the right in American governance.

It bears saying here that migration is not always occasioned by a crisis. Countries in the west often open their doors to migrant workers, who enter the country often as candidates in programs like the Seasonal Agricultural Workers Program (SAWP) and Live-in Caregiver Program (LCP) in Canada, designed to fill jobs that Canadians will not or cannot do. These workers become an integral part of our society and yet are denied full citizenship rights (Perry, 2019; Sharma, 2012; Walia, 2010). They are often tied to their employer, left with low wages and little choice, becoming unwittingly part of a global economy that capitalizes on their labor but offers little in return. Indeed, these migrant foreign workers are the mainstay of fish plant operations in Prince Edward Island, the heart and soul of fruit harvesting in Ontario and Nova Scotia. Filipinos, Jamaicans, and others are welcomed to do jobs that other Canadians will not do, yet they often remain in limbo without adequate access to citizenship or rights and benefits such as health and social services (Barber, 2008). As well, while the migrants live and work in the new country, they send remittances back to their country of origin and maintain close family connections, disrupting the notion of what it means to live in the new country. The United States has similar issues.

None of these nations has a foolproof strategy for immigration. Australia and Canada struggle with integrating non-European migrants, even highly skilled ones, and have been unable to make migration as smooth as it could be (Webb et al., 2017). Clearly, there are complicated relationships among and between states and citizens. While one would hope that universal sustainable goals such as quality education (Goal 4), gender equity (Goal 5), and decent work (Goal 8) and health (Goal 3) would be paramount, it seems that for now they are being sidelined. We look closer at the specific issues that confront them might be integrated in a fulsome immigration approach that integrates learning. Indeed, we see them as a map to be followed in creating a response.

Adult education (goal 4) as a response

As citizens move, the world is watching and trying to respond to the challenges that are inherent in the move: ability to find decent and meaningful work (Goal 8) and the ability to access education (Goal 4) or have credentials recognized. Here we follow the revised UNESCO Recommendation on Adult Learning and Education (RALE; UNESCO, 2016) which sees adult education as crucial in working with those who are in a precarious state. It calls for special attention to migrants and displaced peoples. This 2016 revision of the 1976 recommendation on adult education by UNESCO, was brought forward because of the international CONFITEA process in Belem, and is continuously being monitored as UNESCO realizes the value of global consensus on such an important issue. This understanding of the role of adult education is in sync with and supports the need to assist those who are migrating as they have been “affected by conflict or disaster, [or are] refugees, stateless or displaced persons” (UNESCO, 2016). Attention to the adult in this case is a means of addressing family needs such as seeking employment, language skills and inclusion in a new environment. In addressing education, receiving countries are better able to help the whole family or extended family. This serves as an important document in drawing our attention to the mandate of these countries, as part of their adult education agenda, to look to these asylum seekers, to provide them with help for full integration.

Language acquisition

Related to the attention to adults is second language acquisition which may be needed, as migrants may or may not have the language or indeed the literacy skills necessary to succeed in the new environment or state. In most states, language proficiency is required for participation in the labor market and all too often this proficiency is determined by test taking that may or not correspond to the job being sought or the society in which one will live. Gibb (2015) notes that in this “global knowledge economy, the new work order involves a “new word order”” (p. 251); language can be used to keep people out—it can be a way of strengthening national identity and building borders of exclusion for those found deficient. Rather than assisting with immigration, stringent language policies and lack of instruction support the continued dominance of western colonial powers and the economic and social stratification of the newcomer. Gibb points to the need for those language assessors and tests for assessment to be held to high standards of training and review, else they further reduce the complexity of language to a written test and ultimately fail the newcomer.

Second language acquisition can be a troubling area for women, in particular (see Webb, 2015). To begin with, learning another language does not guarantee employment or integration in receiving countries. Ennser-Kananen and Pettitt (2017) speak to the complexity for women engaging in second language learning in Austria and the US, noting the ways in which these women are positioned as deficits and as passively accepting banking education, while the providers are situated as saviors of the lost. The migrant may also be the target of an attempt to erase the culture and societal practices that were part of the migrant’s past. The assimilation techniques used in many language classes may have the potential of further stereotyping and limiting them. The authors call for the development of programs that develop sustainable agency. This approach works toward the goal of gender equality (Goal 5).

A clear caution on our language and other requirements is that they need to have flexibility and to account for the complexity of tasks, people, social and cultural situations. One of the things that we most forget when we get involved in work with migrants—is the need to incorporate the element of difference: societies that are integrative, not assimilative, work better for migrants (Shan, 2015). Fejes (2019) offers a particular critique of Sweden where welcoming programs like *Swedish from Day 1* work in many ways to homogenize immigrants, to valorize Swedish culture and language, and to ignore the ways that Sweden has already changed by its inclusion of asylum seekers. To present the culture as monochromatic and unchanging is to deny both Sweden and the immigrant.

Language is a key element in the adult education of migrant workers in most countries. In receiving countries like Malta there had been calls to transform the Maltese open centers into LLL centers involving the teaching of skills for either inclusion or relocation, with support from the potential receiving country in the latter case (Mayo, 2017). This seems to be coming to pass, as some of the open centers in Malta have witnessed projects by NGOs in teaching literacy in both Maltese and also English. These programmes are held either inside or outside open centers, in latter case at NGO premises, the Workers' Memorial Building (the main premises of the country's largest trade union, the General Workers' Union) or the Blue Door Institute, the latter managed and financed by St Andrew's Scots Church situated across the street from the trade union building in Valletta, the capital city (Medbalt, n.d., p. 12). The issue of relocation is a key one in recent European policy, with a strategy devised by the EU for this purpose. Few EUMS, however, responded to the strategy, with only Malta and Finland on course to fulfilling their obligations in this regard. Hungary, Austria and Poland, are refusing to participate in the scheme, while the Czech Republic, Bulgaria, Croatia and Slovakia have been critical and unsupportive to date (EC, 2017).

As for actual AE provision in Malta, migrants, regarded as Third Country Nationals (TCNs), enjoy the right of access to educational and vocational training as Maltese citizens, although there are differences with regard to costs incurred. While Maltese and EU citizens have the opportunity to attend MCAST and basic courses offered by the Directorate of Lifelong Learning, in the Ministry of Education and Employment (MEDE), free of charge while they pay for level 1 courses at a subsidized rate, migrants have to pay for the basic courses, and have to pay a higher fee to attend the level 1 courses. Refugees and people under subsidiary protection are often exempt from these charges. An effective LLL strategy intended to include migrants from third countries in Maltese society should address the course price issue, perhaps based on means testing. (Medbalt, n.d, p. 11).

One initiative addressing some of the needs of Third Country Nationals was organized by the state-funded corporation Employment & Training Corporation (ETC) as part of a EU co-financed project (IF 03-2012 Integrating TCNs in Maltese society). The program, "Living and Working in Malta, consisted of the provision of information regarding documents governing work in Malta and basic cultural information, all intended to abet the integration process. This kind of education is the staple of adult education for migrants characterized by what Paulo Freire would call "assistencialismo" (welfarism) (Freire, 1994), a notion of knowledge transmission rendering the learner "object" rather than "subject" (Medbalt, n.d., p. 11).

Recognizing prior learning

Goal 8 on RVA (Recognition, Validation and Accreditation), which has a cache in many spheres, as it purports to provide credentialing and recognition of acquired skills and abilities, with the intent of integration into the labor market, regardless of where they were trained or credentialed or where they previously worked (Singh, 2015). The term RVA is used by UNESCO (2012) to refer to the recognition, validation, and accreditation of the outcomes of nonformal and informal learning. The intent is to have a means of recognizing and credentialing learning that one has accumulated through everyday or otherwise developed purposes. In documenting best practices around the world, in developed and so-called developing contexts, Singh observes that some countries have been more effective than others in implementing the systems of RVA or prior learning and assessment and recognition (PLAR), as it is variously known (Andersson and Guo, 2009).

Despite western European attempts to provide equalization in areas such as university credits (the Bologna Process), there is little evidence these have had the results they expected. In the USA, the system of recognition is located mainly in the higher education sector where mechanisms such as portfolio assessment exist for learners to get advanced standing for degrees and diplomas (Singh, 2015). These systems can provide credit for experiences attained outside formal institutions of learning. In the secondary sector, the US and Canada have systems in place for adult learners to challenge the General Education Development (GED) program in order to attain a high school diploma. Australia, in contrast, has stronger RVA mechanisms in its vocation, education and technological (VET) sector. South Africa has a comprehensive approach that allows for assessment to help in gaining credits, to allow access and to facilitate advancement. The study of RVA makes clear that to decrease barriers to entry to education, the workplace, and social networks, each country needs mechanisms that provide equivalencies and ease access. They are essential to achievement of the SDGs.

One of the key issues raised by the RVA system in a world of knowledge migration and labor market needs is that many countries, including Canada, have sophisticated sets of language proficiency tests, the Canadian Language Benchmarks (CLB) being one. As problematic as the CLB is, it does exist and it is under necessary monitoring and scrutiny (Gibb, 2015). Attention has been drawn to the CLB's competency based framework and its inattention to language as a social practice. Meanwhile, there is no national or adequate RVA mechanism to assess skills and abilities in a similar way, for all occupational groups. Those systems that do exist are ad hoc and need to be more robust (Kahanec et al., 2013) and seen as trustworthy if they are to maintain their usability and practicality. Clearly, RVA is complex and multifaceted and it affects movement of migrants between provinces and countries.

Goal 8 for decent work is key to those migrating steadily across borders, carried and embodied by adults who are on the move. The recognition of diploma and qualifications, according to the Malta Qualifications Network levels, in synch with the European Qualification Framework for Lifelong Learning, falls under the National Commission for Further and Higher Education (NFCHE) that is also responsible for the validation of continuing vocational education and training (CVET). TCNs interviewed for the Medbalt Report by the NGO, Kopin (Medbalt, n.d, p. 11) identified the main problem as being the slowness of the bureaucratic process involved.

Many parts of Europe have been witnessing a situation where people are gaining more qualifications than their parents but cannot enjoy their standard of living, often working in precarious conditions (English and Mayo, 2012). Highly qualified graduates

from Europe emigrate from their country as “employability” does not translate into employment, as Ettore Gelpi once warned (Gelpi, 2002). The translation of skills and abilities across borders is required, as deskilling is the product of an inability to translate. While this problem negatively affects male immigrants, it is especially problematic for immigrant women. Drawing on a research project she participated in (Mirchandani et al., 2010), Slade (2015) notes that women in the study were immigrants with professional degrees in their home countries, but they were able only to find precarious work in Canada, work that in no way approached the level of skill and ability they had attained in their home country.

In Canada, the Federal Skilled Worker Program allows foreign trained workers to become credentialed (Government of Canada). Yet, anyone who has worked with these programs to be credentialed will realize that they are slow, flawed and not always accommodating. In short, as Maitra and Guo note (2019), “curricular and pedagogical approaches associated with lifelong learning can also have colonial undertones”. Guo sees this often as a racial issue (see also Webb et al., 2017). He points out that “It is the “color” of the skill associated with immigrants’ skin color rather than the skill itself which causes the deskilling and devaluation” (cited in Maitra and Guo, 2019). In Maitra’s interviews with racialized immigrants, this came through in the ways in which migrants were told to dress, talk and act like Canadians in order to get a job. This raises the issue of who is Canadian and whether conforming to desired behaviors is justified. Eurocentrism serves as a normalizing discourse that limits the migrant other.

Even in cases where migrants are able to access PLAR mechanisms, there are challenges. Andersson and Guo (2009) note that these mechanisms can be both controlling and devaluing of migrants’ experiences, despite the claims of the providers and supporters. The result is underutilization of skills and the devaluing of people, especially women. Looking especially at the Canadian system, they point to the lack of a centralized agency to assess qualifications and skills and to the existence of a diffuse array of bodies and organizations that serve to accredit immigrants. A similar view is provided, on the basis of research, by the Migrant Women Association of Malta whose sample contained women having significant levels of education. 93.3% of the surveyed were literate, having attended school. Over half completed secondary education, 19.8% completed university studies and 14.8% pursued vocational training. Those who pursued post-secondary education studied such areas as Law, Nursing, Economics and Business Administration. These were significantly represented (34.7%) (Merino, 2017, p. 7). Discrimination was flagged by all national groups represented in the survey. This discrimination took different forms with age being primarily reported by Syrians (81%), while Somalis cited factors, concerning race and gender, were reported solely by Somalis. Somalis and Libyans also reported religious discrimination and some Syrians cited “wearing hijab” as “an additional basis for discrimination” (Merino, 2017, p. 9).

Discussion

Nation states are struggling with migration and with the basics of providing support for newcomers. The conundrum is how to continue leading a nation of citizens while integrating new citizens in meaningful ways so that the quality of life for all is advanced. Governments are deeply immersed in the need to achieve the SDGs, not only for their own citizens but for the global community. From an adult education and lifelong learning perspective, the task is daunting, especially in light of the immediacy of the 17 SDGs slated to be achieved by 2030. We have a challenge like never before but we also have the tools and the knowhow to address it.

There is hope in knowing that migrants themselves are active in their own cause and that they both acquiesce and resist the sometimes oppressive systems they come into. In some cases, this is plain and simply bad behavior. In others, it is finding more and more black market sources of employment, and in others playing along with the system. As Mirchandani et al. (2010) remind us, migrants have always found ways to negotiate troubling issues. Given the unprecedented waves of migration in the 21st century, both invited, as in the Canadian foreign worker programs (Sharma, 2012), and uninvited as in the case of the refugees who literally washed ashore in the Mediterranean in 2016, the global community is facing issues of enormous import for the cohesion of societies and the strengthening of the economic and social systems in which they are embedded. While there has been a coordinated effort internationally to identify the SDGs and to articulate the world we want, there has not been a coordinated international response, in terms of education, health and work. The timely accomplishment of the SDGs demands that their needs be addressed. Agenda 2030 is impossible without active government and citizen support and advocacy for migrants.

Those concerned with adult education are in a key position to address the SDGs not only through assisting migrants to become integrated through language and housing efforts, but also through addressing government policies that affect the health and well-being of peoples (Goal 3). Operating on three levels—local and national, as well as international—those concerned for lifelong learning can help disturb the status quo of neoliberal regimes.

The challenge becomes deeper if we are to take the issue of democracy and social inclusion seriously. This raises important epistemological questions regarding the nature of knowledge. People who migrate have multiple subjectivities beyond that of working for the system, if at all. They represent the phenomenon of “portability of cultures” wisdoms and learning traditions across the globe. This presents the challenge for adult educators, as all educators, for that matter, to tackle the issue of “cognitive justice,” in Boaventura de Sousa Santos’ terms (de Sousa Santos, 2017) and be open to what the same Portuguese sociologist calls “epistemologies of the South” (de Sousa Santos). This takes us back to the earlier question of whose knowledge do we valorize or take on board and whether much of the credit for the origins of this knowledge should lie with, and therefore be restored to, the peoples from among whom many migrants emerge. Much of the knowledge labeled and patented as western is southern in origin. This applies to knowledge adopted in the academic or economic fields.

The best welcome one can provide to people new to the country is recognition of their contribution to the knowledge that has been appropriated and stolen from them. This would mark the restoration of cognitive justice. The other related task is to

learn from migrants' practical and holistic skills, many of which were discarded, in official colonial circles, as too Indigenous and unscientific, judged from a narrow western science standpoint. Some of this knowledge and its underlying philosophy can help teach western societies and their economies a few profound lessons regarding how one can produce in harmony with the rest of nature, using positive natural energy in lieu of that which pollutes, exacerbates global warming and threatens planetary existence, imposing rhythms beyond natural capacities. As [Shiva \(2016\)](#) puts it: soil not oil. In this way, migrants are not simply serving as objects of a top down approach to work but are potential agents of change in work, raising questions about not only how we produce but most importantly what do we produce, in whose interests and to the detriment of whom. All is connected in this world. Unfortunately, this is obscured through the reproduction of a North and South economic imbalance and a myopically perceived separation between humans and nature, the latter appearing to be there for conquest and exploitation. The real challenge for learning, living and producing is to recognize that we do not stand apart from nature but are rooted in it, in a global eco-system. Without romanticizing the cultures of migrants from continents with their own traditions and philosophies, or any culture for that matter, this cosmic vision lies at the heart of some of the traditions in which they have been raised. Think of the First Nations of the United States and their concept of the web of life ([Berry, 1999](#); [O'Sullivan, 1999](#)). Migrants from these backgrounds have much to teach the West with their "portability of cultures" as they cross frontiers and settle in foreign lands. Authentic dialog in the great Freire tradition can help facilitate this process of educational exchange which, in the long run, can help transform the nature of economic practices and the world in which we live.

More immediate, with regard to our present existential situation, without losing sight of the above long term vision, we conclude by offering some key points to consider with regard to policy making, curriculum development and face to face practice in adult education with sustainable development in mind. Education as it is viewed with Goal 4 speaks to the needs of migrants as it addresses their disposability and their vulnerability in a world that is troubled by racism, economic inequality and a constant search for sustainable livelihoods. We see exciting initiatives to address this through bodies such as UNESCO who are working with Member States to find effective policies and strategies to ensure the SDGs are accomplished, from the perspective of Goal 4.

Lifelong learning, stretching across the lifespan, has a key role in integrating all of the sustainable development goals. In its broadest sense, lifelong learning incorporates the informal, nonformal and formal dimensions of learning and infiltrates all the goals and their development.

It is able to help in creative ways, most predictably in preparing citizens for work. Nation states need to work with existing educational and credentialing bodies to make this a reality. Countries like Canada can do more to integrate and credential immigrants who are often highly qualified and skilled. An official central agency such as [Andersson and Guo \(2009\)](#) call for would help in this regard. It would also decrease the drive to westernize Canadianize immigrants through uniform schooling and higher education, as well as PLAR mechanisms that are obsolete and racist.

Adult Education has a direct role to play in maintaining and creating a viable economy. Education in all senses is important here. Sustainability is an ongoing process in a country like Canada which is not a resource rich and yet struggles to find ways to maintain our environment and provide income and decent work (Goal 8) to peoples, especially Indigenous peoples. ESL and EAL can help in creating opportunities for learning and engaging others. This, however, needs to be teaching by qualified educators in these fields, and this without taking anything away from the sterling work provided by volunteers engaged with NGOs. Qualifications matter and so all ESL instruction requires qualified educators ([Smythe, 2018](#)).

Geographic regions containing migrants need to have educational centers for social inclusion or resettlement. These need to be anti-racist and inclusive of efforts that engage productive discussions and practices of the underlying question of power: who dialogs with whom and from which position of power? This, to our mind, constitutes a key critical pedagogical question. It entails turning around some of our more limited efforts. Models of inclusion exist in cities like Toronto which are immigrant rich and multicultural. Community education programs in the context of adult education would foster the spirit of inter-ethnic dialogue.

Final note

Active citizenship requires us to invest in lifelong learning. Migrants need not just skills but also engagement in the democratic participation that is not limited to work. To have gender equality (goal 5) acknowledged is one key part of this work. Workers' education, in the context of adult education, can provide an understanding of the nature of workers' solidarity in this day and age, reaffirming the strong connection between class and ethnicity, indicating that categories as working and middle classes are international in scope and not national, thus helping to avoid misplaced alliances against the competition. LLL can also foster appreciation of the role of immigrant labor in the marketplace, in the homeplace and in the very fabric of our societies in the West. Their labor is value added to our collective wellbeing. The vestiges of colonialism must be dismantled.

Perhaps one of the key ways that lifelong learning can help in the achievement of the SDGs is its role in critical thinking and critique ([English and Mayo, 2021](#)). It can help in de-coding colonial language and policies, and in helping to understand global issues such as migration. It can help in tackling the issues once they are understood. Broader than schooling, lifelong learning can envelope the whole way of life and being, and help move us forward in addressing the predatory situation that wrecks havoc on the environment and people's lives, especially southern people's lives.

Introduction

Historically, international organizations have sought to influence global policy through thematic reports, many organized in a series.¹ These signature publications help justify shifts in international policy priorities, serve as mechanisms to monitor progress toward specific development goals, and seek to shape the direction of national education policies through an evidence-based analysis of priority areas. Many of these annual “flagship” publications include a focused literature review as well as an in-depth look at a special theme—all supported by empirical evidence displayed through extensive tables and figures both in the text and the appendices (Cussó and D’Amico, 2005; Spaulding and Chaudrhuri, 1999).

Global actors have increasingly adopted this model and staked their claim to global thought leadership through the launching of annual or periodic reports. To be sure, influence over policy or practice depends in no small measure on the report’s accessibility—long, highly technical, and research-focused publications curtail readership (Doemeland and Trevino, 2014). And yet, even technical reports can drive political discourse—consider recent controversies involving figures in the World Bank’s *Doing Business Report* (Nicola, 2021).

This chapter focuses on the *Global Education Monitoring Report* (or GEM Report)—formerly the *Education for All Global Monitoring Report* (GMR)—a special report series created and supported by the international education community as a monitoring and evaluation tool to track global progress toward the six Education For All (EFA) goals following the World Education Forum in Dakar in 2000. With time, the GEM Report² has become one of the most influential evidence-based publications in the field of international education development. While certainly not without criticism, the GEM Report series has been referred to as “required reading for anyone interested in education for development, as well as for educational policy-makers in developing countries and for donor agencies” (Brown, 2006, p. 480). Starting in 2002, this annual publication has informed national, regional and global policy makers on a diverse array of education issues and influenced international approaches to educational aid. Drawing on extensive quantitative and qualitative evidence, the Reports have tracked country progress (or lack thereof), highlighted critical challenges and hurdles, and become part of the international education architecture.

This chapter explores the development of the GEM Report series and its use as a reference for policymaking and monitoring progress toward international goals among aid agencies, non-governmental organizations, and developing countries (Daniel, 2010; Packer, 2008). While a key condition for the Report series’ success is its editorial independence from UNESCO, its host institution, the emergence and evolution of these reports are inextricably linked to UNESCO’s role and impact as a knowledge actor in the field of international education development. Therefore, first, we situate the GEM Report series within the historical evolution of UNESCO and the EFA movement. Next, we provide insight into the nature, structure, financing, and production of the report series. We then discuss critiques and evaluations of the reports. Lastly, given the rapidly changing contexts of global education due to the impact of the global COVID-19 pandemic, we consider the future role of the Report series in an increasingly uncertain and disruptive policy landscape.

The historical roots of global reports monitoring education

After two brutal World Wars, the United Nations Educational, Scientific and Cultural Organization (UNESCO) was formed to unite national governments and other international actors under a mandate of peacebuilding through international cooperation including, “full and equal opportunities for education for all” (UNESCO, 1946). Ratified in 1946, UNESCO directed the world’s

¹For example, the Food and Agricultural Organization’s, *The State of Food and Agriculture*, published on semi-regular basis since 1947; the World Bank’s *World Development Report* (1978–present); UNICEF’s *State of the World’s Children Report* (1980–present); the United Nation’s (UN) Development Program’s *Human Development Report* (1990–present); or the UN’s Educational, Scientific and Cultural Organization’s (UNESCO) *World Survey of Education* (1955–1971), *International Yearbook of Education* (1946–1969 ... 1979–1994), and the *World Education Report* (1991, 1993, 1995, and 1998).

²The term “GEM Report” refers to both the earlier series of EFA Global Monitoring Reports as well as the rebranded GEM Reports.

commitment to a global goal of “education for all.” Through its policies and international activities, UNESCO launched an “attack upon ignorance by helping all member states who desire such help to establish a minimum Fundamental Education³ for all their citizens” (Memorandum on the education program of UNESCO, Paper No. 1 prepared by the Education Staff of the Preparatory Commission, 1946 as quoted in Boel, 2016, p. 154). Since its founding, UNESCO has framed educational development as a technical and policy matter, centering scientific research and technical advice as the crucial ingredient to improve schooling around the world (Huxley, 1946). Given this underlying theory of change, UNESCO positioned itself as an innovator, standard-setter, and capacity builder in the education sector, leading the field in both the production and dissemination of global education knowledge (Menashy and Manion, 2016).

UNESCO’s early outreach programs focused on providing technical assistance in education. For example, it sent field officers to newly independent countries to help establish and expand education systems and literacy programs (Duedahl, 2016). Between 1946 and 1958 UNESCO was involved in activities related to fundamental education in at least 62 countries (Boel, 2016, p. 168). These included extensive fieldwork in the Democratic Republic of Congo in support of its emerging education system (Dikay, 2016), and a mass literacy campaign in Indonesia helping more than 10 million people gain literacy skills over the 12-year period (Boel, 2016). In the 1950s, UNESCO mobilized efforts to make good on country commitments to universal education by convening regional conferences on compulsory school legislation (e.g., in Bombay 1952, Cairo 1955, Lima 1956), and universal access to education (e.g., in Karachi 1960, Addis Ababa 1961, Santiago 1962, Tripoli 1966). These early efforts contributed to countries adopting compulsory attendance laws throughout the world. Today nearly all countries have established such laws and more than 75% of all countries require 9 years or more of compulsory education (UNESCO, 2020).

In addition to technical assistance, legislation and policies to help universalize access to basic education, UNESCO focused on the production and dissemination of educational statistics and research (Huxley, 1946). While UNESCO had emerged as a global leader in educational development by 1960, its position as a thought leader was contested. Some UNESCO-supported education initiatives were met with resistance (Boel, 2016). The use of research, data, and evidence to inform educational policymaking, far from politically neutral acts, raised concerns. Documented tensions between UNESCO’s political and technical roles in the international arena impacted both UNESCO’s funding and its ability to see its mission through to fruition (Burnett, 2011; Jones, 1988; Menashy and Manion, 2016; Mundy, 1999, 2006; Mundy and Manion, 2015). By the 1980s, many in the international community began to question UNESCO’s ability to provide rigorous, reliable technical advice; concurrently, several multilateral organizations, including the World Bank, UNICEF, and the OECD, began developing their own pool of education experts to inform education policy and programming (Burnett, 2010; Cussó and D’Amico, 2005).

And yet, despite an expanding technical evidence base, international donors in education did not consolidate around a common policy agenda. During the latter quarter of the 20th century, the assessment of education priorities changed rapidly and diverged widely, resulting in a general lack of consensus as to “what works” in development education (Mundy, 2006). In addition, the divisive politics of the cold war limited opportunities to align bilateral support to newly established education systems. Donor governments often used education as a tool to support their geopolitical agendas and encouraged neoliberal education policies in the Global South (Dale, 2005; Magrath, 2014; Robertson and Dale, 2006). As a result, instead of a globally united movement toward EFA, educational development projects were often short-term, small to moderate sized, bilateral transactions, many of which worked at cross-purposes (Mundy, 2006).

Fragmented efforts in support of universal education shifted in the 1980s as a global consensus around education began to emerge. Under the leadership of James Grant (then UNICEF Executive Director), the World Bank, UNDP, UNESCO and UNICEF formally established and funded an Inter-Agency Commission (IAC) on EFA, which together with an Executive Committee and a small Secretariat housed at UNICEF headquarters in New York, was charged with coordinating a global meeting of international actors working toward EFA (Little and Miller, 2000). The resulting World Conference on Education for All, held in Jomtien, Thailand in May 1990, marked a major breakthrough for the EFA movement—in tone, organization and intended impact.

The Jomtien meeting brought together representatives from 155 UN member states, delegates from 33 multilateral institutions, and representatives of 125 non-governmental organizations (NGOs), who contributed to a framework for action around the overarching goal of EFA (Packer, 2008). Multilateral and bilateral agencies connected with networks of NGOs to revitalize efforts to build global consensus around educational priorities. Following the meeting, the IAC Secretariat was moved to a new home at UNESCO headquarters with funding from UNESCO, UNICEF, UNDP, and the World Bank. Instead of focusing on action, the IAC was asked to play an advisory role to the international community—provide general guidance on successful approaches and promising new strategies, report on actual progress and discuss issues of widespread concern (Little and Miller, 2000).

³The notion of fundamental education, which was understood to be “at the heart of the work of UNESCO” in the early 1950s, was broad in meaning and scope and transformative in intent. The first of 12 *Monographs on Fundamental Education*, published in 1949, stated that “the aim of all education is to help men and women to live fuller and happier lives.” The idea of fundamental education was to enable communities to change living conditions through education in a wide range of areas, such as health education, domestic and vocational skills, knowledge and understanding of the human environment—including economic and social organization, law and government—and what was called “the development of qualities to fit men to live in the modern world, such as personal judgment and initiative, freedom from fear and superstition, sympathy and understanding for different points of view.” <https://en.unesco.org/news/fundamental-education-pioneer-concept-jens-boel-explains-why>.

The placement of the IAC within UNESCO could be interpreted as a sign of the global community's faith in UNESCO as a major producer and disseminator of educational data and statistics. But in fact, UNESCO came under considerable criticism in the 1990s by UNICEF and the World Bank regarding the quality, reliability, and relevance of its educational statistics (Cussó and D'Amico, 2005). In the wake of budget cuts, restructuring and belt tightening, the Division of Statistics at UNESCO headquarters was severely weakened. An external panel of consultants recommended that the Division needed greater autonomy and funding, and in 1999 UNESCO decided to relocate the division to Montreal and rename it the UNESCO Institute for Statistics to address these concerns (Cusso, 2006). Actual progress toward EFA during this decade was limited and uneven. Structural adjustment policies by the IMF undercut national allocations to education and needed funding from the donor community did not materialize (Delamónica et al., 2001). Moreover, collaborations among multilateral agencies (i.e., UNESCO, UNICEF, UNDP and the World Bank), national governments and NGOs were the exception, not the rule (Little and Miller, 2000). Thus, while Jomtien may have united the global community around a common EFA Framework, in practice international aid and assistance to national education sectors in the Global South remained splintered. Implementation of national EFA plans was uneven.

The establishment of a global EFA discourse and an emerging architecture for international aid to education did have some salutary benefits. More governmental and non-governmental actors embraced international development targets and EFA strategies to achieve them (Mundy, 2006). Multilateral organizations (e.g., the World Bank, UNDP, UNICEF, and the OECD) individually and collectively continued to raise the overall profile of EFA and keep it on the global development agenda (Edwards et al., 2018). Toward the end of the 1990s the IAC brought together more than 180 countries for a series of regional and sub-regional meetings to assess global progress toward EFA. The results of this assessment were reported in both a global synthesis document (Skillbeck, 2000), as well as a statistical report (UIS, 2000), and served to re-emphasize the significance of, and broad support for, the EFA agenda.

In 2000, more than 1100 members of the global education community (including representatives from donor agencies, multilateral organizations, NGOs, civil society groups, and 164 national governments) once again came together at the World Education Forum (WEF) in Dakar, Senegal to reconfirm their mutual commitments to EFA (Benavot et al., 2016). This time the international education community was determined to harness existing momentum and ensure that the WEF resulted in actionable targets and clear agendas to guide efforts going forward (Edwards et al., 2018). A key outcome of the Dakar meeting was the co-creation of clearly formulated, time-bound and measurable global education goals. This became the basis of *The Dakar Framework for Action*, officially adopted at the end of the Forum. The six Dakar goals consisted of: (1) Expanding early childhood care and education; (2) Providing free and compulsory good quality primary education for all; (3) Promoting the acquisition of life-skills by adolescents and youth; (4) Expanding adult literacy; (5) Eliminating gender disparities in education; and (6) Enhancing educational quality. In addition to goal setting, the Dakar Framework established mechanisms to move the EFA agenda forward and hold global stakeholders (i.e., international agencies, governments, donor partners, civil society, and the private sector) accountable for meeting the six EFA goals.

While many assumed that the World Bank would be charged with responsibility over the new EFA agenda, the participants of the Dakar Forum selected UNESCO for the key coordination role, including the creation of a new EFA High-Level Group (HLG) composed of Ministers, UN and bilateral agencies, and civil society representatives to be housed at UNESCO (Edwards et al., 2018). The Dakar Framework mandated that the HLG was to be "... informed by a monitoring report from the UNESCO International Institute for Educational Planning (IIEP), the UNESCO International Bureau of Education (IBE), the UNESCO Institute for Education (UIE) and, in particular, the UNESCO Institute for Statistics (UIS), and inputs from Regional and Sub-regional EFA Forums" (UNESCO, 2000, p. 10).

Enter the Education for All Global Monitoring Report

Monitoring EFA progress and holding countries and donors accountable to their EFA commitments were central concerns during the first annual meeting of the HLG, held in Paris in October of 2001. The Dakar Follow-up Unit at UNESCO was asked to prepare a short report to facilitate discussion among HLG members. This initial EFA monitoring report, entitled *Monitoring Report on Education for All: 2001*, provided: (1) an overview of the fundamental operating assumptions underlying the strategies outlined in the Dakar Framework and the structures that were agreed upon in order to implement the Dakar Framework; (2) an overview of global progress toward the EFA goals supported by data from UNESCO; (3) the current status of planning for EFA at both the national and international level, including an overview of international cooperation and resource mobilization toward EFA and the role of non-state actors; and (4) suggestions for moving the EFA agenda forward.

The initial report was not well received by the HLG (Edwards et al., 2018). Many characterized it as lacking adequate depth and analysis. Many HLG members viewed this EFA report—in addition to an earlier UNESCO monitoring report submitted during the Mid-Decade Meeting on EFA in Amman Jordan (UNESCO, 1996)—as falling short of the kind of authoritative monitoring report that honestly assesses EFA progress and provides direction to countries and the international community of needed actions to meet their EFA commitments (Universalia, 2006). The HLG decided to mandate a new report to be submitted at future meetings: "An authoritative, analytical, annual EFA Monitoring Report should be produced drawing upon national data—quantitative and qualitative—and assessing the extent to which both countries and the international community are meeting their Dakar commitments" (UNESCO, 2001, p. 29). To improve the report's quality and relevance, the HLG stipulated that UNESCO should urgently convene

key partners to discuss how the report should best be prepared, managed, and resourced, and that UIS should be given an important role in the development of the report (UNESCO, 2001).

Three months later, UNESCO convened a planning meeting of international stakeholders and education experts. Participants agreed that the new EFA Global Monitoring Report must be owned by, and report to, the EFA community (Universalia, 2006). Members of the planning meeting decided that while UNESCO would host the Report series, by providing office space and publishing services, the new Report team would be editorially and financially independent from UNESCO, guided by an international Advisory Editorial Board (Packer, 2008; Universalia, 2006).

In cooperation with the head of the EFA Observatory at the UNESCO Institute of Statistics, the Dakar Follow-Up Unit quickly pulled together a small team of 11 education experts to work under the guidance of a high-profile director, Professor Christopher Colclough, who had demonstrated experience bridging research and policy in the field of development education (Edwards et al., 2018). There was no formal governance structure for these reports. The Report Director was given the ultimate responsibility of conducting and coordinating research for each report in addition to drafting its content.

The Director worked with its newly established Editorial Board to formulate a vision statement for the Report series:

“An authoritative annual report, which holds the global community to account for commitments made at the World Education Forum. It will chart progress against the six Dakar goals and targets, including the Millennium Development Goals (MDGs) for education, highlight effective policies and strategies, alert the global community to emerging challenges and promote international action and co-operation. An indispensable advocacy and technical tool for everyone involved in promoting Education for All.”—Internationally Agreed Vision Statement, Global Monitoring Report on EFA, January 2002.

Universalia (2006, p. 5).

Members of the Editorial Board also underscored the critical importance of the Report’s editorial independence. A “key outcome” of the Board’s second meeting (July 2002) made this point crystal clear:

Independence: the independence of the Report is crucial, and it will therefore not be a report “from UNESCO,” but rather “to UNESCO.”

Under severe time constraints, the first edition of the Education for All Global Monitoring Report (GMR) was published in late 2002, defining indicators and measures, and analyzing global progress toward each of 6 EFA goals.

Whatever vision the HLG may have had when it established the Report series, the Reports took on a dynamic life of their own. Between 2002 and 2015 twelve Reports were published (see Table 1). Noted for their crisp and accessible writing style, careful

2021–2022	Non-state actors in education: who chooses? Who loses?	Manos Antoninis	474

^aIn 2001, in the wake of the Dakar EFA conference UNESCO asked an internal team led by Abhimanyu Singh to prepare a preliminary monitoring report (called the Monitoring Report on Education for All). This 51-page report can be considered as a forerunner of the EFA Global Monitoring Report series, even though it was not editorially independent of UNESCO.

argumentation, peer-reviewed analysis and extensive presentation of diverse evidence, early editions set a high standard for an informative and analytical global monitoring report.

Altogether, between 2002 and 2022 seventeen GEM Reports were produced. The reports drew on current statistics and other data sources to monitor progress in relation to international targets. They highlighted international trends in education, identified effective policies and reforms, assessed political commitments, discussed challenges and constraints, and promoted specific international strategies and cooperation. Fourteen of the 17 reports explored a crucial theme, understood to foster—or hinder—global educational progress (Table 1). These themes included gender quality, teaching and learning, adult literacy, inequality and marginalization, armed conflict, accountability, migration and displacement and non-state actors.

It was the GEM Report Advisory Board (initially called the Editorial Board), and not the Director, that determined the theme of each Report. The Advisory Board, which increased in size over the years, included funders of the report as well as representatives of multilateral and bilateral agencies, NGOs, civil society organizations, academic experts, and directors of UNESCO institutes (UNESCO, n.d.). In 2022 the Advisory Board included three dozen members and a dozen observers. While each Advisory Board provided advice on different report-related matters, its main statutory responsibility is singular: to select the theme of a future report. Once the theme is confirmed, the Report team immediately begins working on a comprehensive concept note and a new report cycle is initiated.

On average, it takes 18 months to produce a report—from concept note to finished publication (Universalia, 2010). Since 2002 the size of the team involved in the development, production, and dissemination of the Report has doubled—from about a dozen members to twice that number today. This increase mainly reflects the elaboration and diversification of website content and the preparation of several specialized publications—namely, a youth report, a gender report, focused language summaries, and, recently, a regional report. The main report relies on dozens of external experts who are commissioned to prepare thematic or monitoring related background papers, selections of which are integrated into the draft text. While the team follows UNESCO's administrative procedures for budgeting, contracts processing, and staffing (Edwards et al., 2018), it maintains its editorial autonomy and follows a flexible managerial and operational style to meet shifting and multiple production schedules (Carpenter et al., 2014).

It could be argued that many UNESCO colleagues were initially ambivalent toward the relatively well-resourced and editorially independent Report series, but this has given way to a more positive attitude toward the content and messages of each Report. Most UNESCO field and regional offices organize annual launch events, to which key government officials and other education stakeholders are invited. These events, at which key Report findings and policy messages are presented and discussed, help strengthen ties between UNESCO officials and various education stakeholders in the country or region.

In terms of UNESCO's formal role toward the GEM Report, little has changed. UNESCO provides a small annual financial contribution to the report (about \$50K USD). A more significant contribution is in-kind: administrative support at headquarters; data and technical support from UIS; some communication support involving press releases and media tracking; report distribution to UNESCO offices; and on-going engagement with UNESCO regional, cluster and national offices to conduct events and distribute reports. National Commissions to UNESCO are involved in the dissemination of the report in their respective countries and communicate key messages to national government officials and other stakeholders (Universalia, 2010).

Since 2002 bilateral agencies and international organizations have collectively provided funds for the research, drafting, production and distribution activities undertaken by the Report team. While this pooled funding model has helped ensure the editorial independence of the Report, it does involve a measure of unpredictability, undermining attempts at long-term planning. For example, report funding varied from \$5,360,000 in 2006, \$7,166,000 in 2011, and \$3,395,000 in 2013 (values adjusted to 2013 US dollars) (Carpenter et al., 2014; Universalia, 2010, p. 36). Typically, two to four major donors cover half of the total budget; the remainder is funded by a shifting collection of smaller contributors (Ipsos MORI, 2018).

Over time, the number of funders of the Report series has increased about threefold: from an average of 5–6 funders in the initial years to 16–19 funders in recent years (See Table 2). Six bilateral agencies have been regular contributors to the GEM Report over the entire 20-year period: France, Germany, Ireland, Norway, Sweden and Switzerland. The Netherlands and the UK have also been significant, albeit inconsistent, donors. Many other agencies and foundations have been irregular or one-time contributors. Agreements between a donor and the report team typically cover only 1 or 2 years, which means that the team must constantly engage in fundraising efforts, which ultimately detract from long-term planning. Despite the ebb and flow of funding over the years, the GEM Report team has managed to consistently produce high-quality, insightful reports, which are read or reviewed by diverse audiences: ministers and ministerial officials, international aid agencies, non-governmental organizations, as well as researchers and students (Packer, 2008; Daniel, 2010; Ipsos MORI, 2018).

Shifting policy regimes: the emergence of Global Education Monitoring Report

The evidence suggests that the Report series has evolved from a straightforward EFA monitoring tool to an integral pillar in the international education architecture (Burnett, 2019). The Report positioned itself as part of a broad epistemic community of actors involved in international development and education. In doing so, it sought to reflect the views and perspectives of a wide-ranging and oftentimes contentious community of stakeholders.

Sources: 2016 Report to funders, GEM Report Advisory Board Meeting; and then GEM Reports 2017–2021/22.

In practice this meant commissioning background papers from experts and organizations from around the world. These externally commissioned papers, together with in-house literature reviews, tapped into a vast pool of existing academic and gray literature that examines national and regional progress, especially in particular areas like gender, quality, inequality, learning, governance and sustainability and informs the global education agenda. The team's engagement with experts and organizations created a knowledge network comprised of diverse global education stakeholders, which can be examined through the application of bibliometric analysis to the references included in the published Reports.

References in the first 12 Reports illustrate the sheer amount of knowledge produced by key actors in the international education policy field. Analysis of the 12 reports published between 2002 and 2015 found the Report team had cited a combined total of 8271 references, incorporating the perspectives of 6833 authors, including 6239 (91%) individuals and 595 (9%) organizations (Read, 2017). Across the combined bibliographies of the 12 Reports, eight publishers were referenced 100 or more times—accounting for 39% of all references during that period (Table 3). By comparison, 248 publishers (15.1%) were referenced only once. But even among this elite group of eight publishers, three key organizations were disproportionately cited, including the World Bank (listed as publisher for 825 references), UNESCO (709 references), and the GEM Report itself (listed as publisher of 653 references, mostly background papers commissioned for each Report), with the OECD coming in as a distant fourth (298 references) (Read, 2017).

However, while this analysis shows that the Reports have been influenced by a handful of key thought leaders in the field of global education, it also shows that the Reports have, in some sense, lifted all boats in the field. A comparison between the citation networks of the 2002 and 2015 reports (Fig. 1) clearly reveals the growth of the report's international knowledge network, with more actors and more types of actors consistently being cited in the reports during this period. The actors included multilateral and bilateral organizations, leading NGOs, think-tanks, philanthropic foundations, private companies, research teams and individual experts. By referencing wide-ranging research studies, data sources and voices, the GEM Reports helped increase the visibility and legitimacy of thousands of individual experts and smaller civil society and non-governmental

organizations in the field. To the extent that the Reports created spaces for smaller actors to engage with thought leaders in open, independent, and informed debates, this helped solidify the Reports' status as an essential source on the state of global education (Edwards et al., 2018).

By the time the international education community came together at the World Education Forum in Incheon, South Korea to adopt a post-2015 education agenda, the Report series had become a common reference point for multiple stakeholders. The Report team had earned a reputation for being an independent, reliable, and authoritative source for accurate data and relevant evidence on EFA progress. At the Incheon meeting, it was proposed that the EFA Global Monitoring Report be rebranded as the Global Education Monitoring Report and given a formal mandate to monitor the emergent global goal on education (SDG 4) and its 10 targets. Participating delegates—namely, education ministers, heads and members of delegations, heads of agencies, officials of multilateral and bilateral organizations and representatives of civil society, the teaching profession, youth, and the private sector—had few caveats in adopting paragraph 18 of the Incheon Declaration, which states:

the Education for All Global Monitoring Report be continued as an independent Global Education Monitoring Report (GEM Report), hosted and published by UNESCO, as the mechanism for monitoring and reporting on the proposed SDG 4 and on education in the other proposed SDGs, within the mechanism to be established to monitor and review the implementation of the proposed SDGs.

UNESCO et al. (2015, p. vi).

UNESCO, in consultation with the Report Director, supported the rebranding of the Global Education Monitoring Report and embraced its new focus on monitoring all education-focused SDG targets, which were officially adopted by the UN General Assembly in September 2015. The institutional standing of the GEM Report was further acknowledged in the *Education 2030 Framework for Action* endorsed by ministries of education at UNESCO's General Conference in November 2015 (Jamil, 2016). The Education 2030 Framework document stated:

The EFA Global Monitoring Report will be continued in the form of the Global Education Monitoring (GEM) Report. It will be prepared by an independent team and hosted and published by UNESCO. The Director of the team is appointed by the Director-General of UNESCO. Attention will be paid to geographical balance in its Advisory Board. The GEM Report will be the mechanism for monitoring and reporting on SDG 4 and on education in the other SDGs, with due regard to the global mechanism to be established to monitor and review the implementation of the 2030 Agenda for Sustainable Development. It will also report on the implementation of national and Education 2030 Framework for Action international strategies to help hold all relevant partners to account for their commitments as part of the overall SDG follow-up and review.

UNESCO et al. (2015, pp. 28–29).⁴

The position of the GEM Report series in the post-2015 global education landscape was now secure. National policymakers, donors, international agencies and NGOs had voted their preference for an independent monitoring and accountability mechanism, endorsing the Report's model of financial and editorial independence. Under its new SDG mandate, the monitoring agenda of the GEM Report significantly expanded, with a more extensive and complex set of education targets and indicators to review. And yet, despite its expanded SDG mandate, the GEM Report faced an uncertain future, since many donors were either reluctant or slow in committing funds to the GEM Report series. As a result, the team was forced to allocate considerable time and effort to secure additional donors and increased funding from existing donors, even to maintain previous funding levels (Ipsos MORI, 2018). Between 2015 and 2017 the GEM Report received annual funding contributions from donors that ranged from \$3,000,000 to \$6,000,000 US dollars (Ipsos MORI, 2018, p. 10).

In these years the GEM Report adapted its monitoring toolkit to the broader and more ambitious SDG framework. It laid the groundwork of an expanded monitoring strategy in the pivotal 2016 GEM Report, carefully reviewing proposals for global indicators of SDG4 targets, as well as the validity, reliability and relevance of existing and new data sources.

The output of the GEM Report also evolved. In addition to the main report, which had been regularly published in almost all UN languages, the Executive Summary was translated each year into 10–15 additional language versions. Drawing on recommendations of the external evaluations, the GEM Report decided to diversify its knowledge products—for example, gender reports, youth reports, policy papers, infographics and, since 2019, thematic regional reports—to enhance the dissemination and influence of each Report's conclusions and policy recommendations. The team also expanded its online monitoring resources: PEER (Profiles Enhancing Education Reviews) compiles information on education laws and policies to help countries compare and learn from others; WIDE (The World Inequality Database on Education) visualizes data showing inequalities by groups, within and between countries; SCOPE (Scoping Progress in Education) provides visualizations explaining the data complexities behind SDG 4; and VIEW (Visualizing Indicators of Education for the World) compiles multiple data sources to look at completion rates over time by country and region.

These publications and resources, available on the Report website, were highlighted in more than 100 launch events held each year in locations around the world. It is estimated that 2 million copies of the report series have been downloaded from the website since the team began tracking website traffic. Launch events attracted relatively large audiences and typically included senior government officials, ministers of education, researchers, teachers, youth and representatives from civil society and the private sector (GEM Report, 2016). The report communications team collaborated strategically with many partners to extend messaging—for example, UNESCO field offices, other UN agencies (UNICEF, UNHCR, ILO), the Global Partnership for Education, the Global Campaign for Education, Education International, Malala Fund, Pratham and Education Cannot Wait (Ipsos MORI, 2018).

The team's communication strategy evolved to reach broader audiences. It included a newsletter, social media campaigns, photo competitions, and interviews and collaborative pieces with news media. The team (with some support from UNESCO) tracked media references of the Report—for example, in the Guardian, Al Jazeera, The Times Higher Education Supplement, BBC, The Dawn, Le Monde, RFI, and The Times of India among others. In 2013 report media coverage reached over 31 million people in 100 different countries (Redman, 2020).

In March 2010 the GEM report established a successful presence in the education blogosphere—the World Education Blog (<https://world-education-blog.org/>). Over the next 11 years (until the summer of 2021 when it moved to a new location), this blog-site published 1060 blogs that attracted 2.5 million views and 1.5 million visitors. The editorial independence of the World Education Blog allowed it to publish diverse individual and organizational viewpoints on global education issues, as well as pieces that amplified findings, interpretations and policy recommendations found in the main GEM Report or in related publications (e.g., policy papers, Gender Review, Youth Report).

⁴It is important to note that role of UNESCO's Institute for Statistics in preparing internationally comparable data for multiple end users, including the GEM Report, was also strengthened at the two 2015 meetings. The autonomy and evolution of UIS clearly deserve closer scrutiny following the adoption of the Education 2030 Framework for Action.

These communication and dissemination efforts raised awareness of the status of EFA or SDG progress as well as the nature and scale of the challenges facing national, regional and international actors seeking to advance global education agendas.

Critiques and evaluations of the GEM Report series

Prior to publication each GEM Report is critically reviewed by a group of academics and subject experts. After publication many GEM Reports have been reviewed and critiqued in select academic journals. Most scholarly critiques revolve around specific indicators or arguments advanced in a particular report. For example, [Alexander \(2015\)](#) notes that the EFA indicators measuring quality education cover a narrow range of variables, thus raising questions about the fit of the EFA monitoring process to encourage countries to transform approaches to teaching and learning. Alexander criticizes the top-down application of research for education monitoring and argues instead for a more radical, creative and inclusive approach that defines teaching and learning indicators from the bottom up. [Lewin \(2011\)](#) also takes issue with several metrics found in the Reports. Specifically, he challenges the Education for All Development Index (EDI) used in the earlier Report series, noting that aggregated composite indexes like the EDI are difficult to interpret and of limited use in measuring educational progress.

[Gordon \(2010\)](#) notes that while some aspects of the 2005 Report's *Framework for Understanding Education Quality* (see [UNESCO, 2005](#), p. 36) are helpful, they fail to problematize the broader historical and socio-economic contexts in which educational processes are situated. Gordon argues that the lack of an explicit value basis in the Report Framework limits the articulation of deeper critiques that go to the heart of the provision of good quality education, particularly in fragile and conflicted affected countries. In a more recent critique, [Magee \(2020\)](#) argues that the 2019 GEM Report on *Migration, Displacement and Education* does not go far enough in holding the global community to account for their commitments to refugees and the displaced. "If publications like the GEM report are going to play a successful role in accountability, much greater emphasis needs to be placed on monitoring international commitments, working toward a more just distribution of global wealth and education's role in achieving it" ([Magee, 2020](#)).

In addition to these scholarly critiques, there have been four external evaluations of the Reports—in 2006, 2010, 2014, and 2018—conducted by expert teams through an open tender process. These evaluations assessed the overall quality of the reports; the efficiency of the production and distribution processes; the effectiveness of the team's communication, media, and other outreach work; and, notably, the impact of the reports in terms of global reach as well as uptake in policy and practice. Overall, the evaluations found that the reports conform to their core mandate and are based on well-grounded research and analysis presented in engaging ways.

A recurrent critical theme in several evaluations is that the Report's global nature limits its policy relevance to specific national or local contexts. This lack of granularity tends to undermine the Report's influence and impact. While Directors have no intention to revise the Report's core *global* mandate, they have taken steps to address this concern—for example, assigning members of the drafting team to follow policy developments in specific regions; preparing succinct regional overviews of EFA progress; commissioning background papers that focus on a particular case or region; and using boxes to illustrate a broader point by focusing on a particular case. The decision to develop a full-blown regional report is the most recent indication of a shift in this direction.

All evaluations make clear that the editorial independence of the Report series has enhanced its perceived credibility as well as its rigor, insight and quality. As one Advisory Board Member noted: "The one quality that GEM Report has is that it is seen as a credible and trusted voice, and it can only be seen as trusted if it is seen as being independent of influence, and that must include UN influence" ([Ipsos MORI, 2018](#), p. 19). Although UNESCO hosts and publishes the Report as its "flagship" publication in education, UNESCO leadership has no say over the Report's content, which is determined by the Director. The 2018 evaluation supported this point: in a survey of stakeholders, more than 80% of respondents from UNESCO and agencies dependent on UNESCO agreed that the Report is an independent source of information ([Ipsos MORI, 2018](#), p. 19). And yet, this independence from UNESCO comes at a cost, since the Report's continued viability as a global public good depends on the generosity of external donors.

Between 2015 and 2020 the GEM Report received annual funding contributions from donors that ranged from just under \$4 million to almost 6.5 million US dollars for each year of the report, with an average of \$6.1 million per year between 2017 and 2020.⁵ The increased financial stability of the Report series in recent years, while important, involves considerable transaction costs. The time and effort needed for fundraising is significant ([Ipsos MORI, 2018](#)). If the funding levels of donors diminish, for whatever reason, the resulting financial instability could compromise the quality of the Report, and possibly jeopardize its editorial independence. New donors may come with strings attached—seeking to further their own agenda by demanding greater influence over the Report's content ([Ipsos MORI, 2018](#)).

In terms of distribution, the evaluations indicate that the Reports could benefit from a more strategic collaboration with UNESCO, particularly its field offices, to better distribute the Report and disseminate its messages and recommendations to policy makers on the ground. In-country investigations revealed that UNESCO field offices rarely develop strategies to distribute reports, track its targeted recipients, or develop feedback mechanisms to share stakeholder views with the Report team ([Carpenter et al., 2014](#)). Indeed, relying on field offices results in significant geographical gaps in distribution, particularly in Eastern Europe and

⁵A table listing the annual contributions of each funder was provided to the authors by the GEM Report Director.

Central Asia. Most requests for hard copies are concentrated in Europe and North America, whereas digital copies receive more downloads in lower income countries (Carpenter et al., 2014).

With regards to impact, the external evaluations used different methods to gauge the Report's influence. They measured the number of times that a GEM Report is mentioned in the media. They analyzed report launch strategies and distribution lists. They interviewed select international, regional and national stakeholders, who are involved in international development and education. For example, a survey of 1228 global education stakeholders conducted for the 2018 evaluation found different audience groups use the GEM Report for different purposes. The survey found most respondents used the GEM Report as a reference to support their existing work or study (76%), reference to identify good practice for policy (59%), or as a source of personal development and training (54%). Fewer respondents reported using the GEM Report as a source of evidence to influence strategy, programming, or policy in their organization (48%), or as an advocacy tool outside of their organization (32%) (Ipsos MORI, 2018, p. 46).

Overall, stakeholder-respondents find the reports to be relevant to education priorities in the international context, as well as relevant to their work on the ground. That said, many lack awareness of the critical role of UIS in sourcing and validating internationally comparable data. This means that some respondents interpret data shortcomings to be fault of the Report itself (Carpenter et al., 2014). For example, some critiqued the GEM Report for reporting statistical data that were not up-to-date—a needed condition for effective decision making, particularly in the Global South (Carpenter et al., 2014; Ipsos MORI, 2018; Universalia, 2006). The 2014 evaluation quoted an Indian official who indicated that they rarely use data from the Report because it is out-of-date; they prefer annual education data generated by more reliable government sources (Carpenter et al., 2014, p. 18). Another issue was the use of differing methodologies—national vs. international—to estimate specific data points. For example, Viet Nam disputed school drop-out figures in the 2008 Report since their Ministry used a different methodology from UIS (Carpenter et al., 2014).

The evaluations also use bibliometric methods to assess the citation impact of the reports. Such methods provide evidence of a substantial growth in citations of the reports in scholarly and academic publications. Each of the Reports published between 2002 and 2010 garnered more than 100 citations in publications included in the SCOPUS database, with a substantial increase in the number of times the reports are cited after 2009 (Carpenter et al., 2014). Most of these citations came from the authors affiliated with US or UK based research institutions, but also authors based in India, South Africa, Ghana, and other East African countries. By contrast, few authors from Southeast Asia, Central Asia, or Latin America cite the report in publications archived by SCOPUS (Carpenter et al., 2014, p. 32). 257 academic publications cited the 2015–2017/18 reports, including scholarly articles, books and book chapters, proceedings papers, editorial materials, letters and reviews (Ipsos MORI, 2018, p. 15). And the GEM Report remained the most widely cited global monitoring report on education (Ipsos MORI, 2018, p. 39).

With regards to the report evidentiary base, the 2014 evaluation noted that these "... sources are dominated by English language publications and research organizations in the global North" (Carpenter et al., 2014, p. 13). Specifically, 84% of all background reports commissioned between 2011 and 2014 were produced by authors with organizational affiliations in Europe and North America. By contrast, only 6% were prepared by authors with affiliations with East Asia, 4% with South and West Asia, 3% with Sub-Saharan Africa, 2% with Latin America, and only 1% with an organizational affiliation with the Arab States (Carpenter et al., 2014). This pattern reinforces the uneven geographical distribution of expertise mobilized for and reflected in the reports. Despite efforts to address this issue—through in-house literature reviews and by establishing links with Global South research institutions as potential contributors and research partners—the reports have clearly struggled to integrate Global South and Indigenous voices into the reports. Thus, while representatives from NGOs, multilaterals, and research institutions and the evaluation teams felt that the commissioning of background reports for the GEM Report is invaluable to the education for development field, "... as there are few other sources of funding to stimulate such focused research in the education sector [and the] commissioning work of the Report has potential to build research capacities in all regions of the world" (Carpenter et al., 2014). And yet there is a clear need to make sure that Global South authors have sufficient opportunity to participate in GEM Report think-pieces, consultations, and background papers to improve geographic representation of the Report, enhance ownership, and localize findings (Ipsos MORI, 2018, p. 71).

Finally, the evaluations revealed tensions between the Report's role as a technical document providing analytical data to inform decision making, and its role as an advocacy document alerting the global education community to areas of concern and advancing specific policy recommendations (Universalia, 2006, 2010). Some stakeholders believe the Report should be a prescriptive document, spotlighting key advocacy messages to achieve real change and commitment from international stakeholders. Others insist the Report must be an "objective" document that maintains neutrality in its effort to monitor the situation in some sub-sector of education, arguing that a prominent advocacy role could compromise the objectivity and credibility of the reports.

Looking ahead at monitoring challenges and pandemic recovery

The post-2015 global monitoring landscape is complex and challenging. UN Members States agreed on the global indicators for each SDG targets in 2017 after 2 years of negotiation. And "the global indicator framework ... is a voluntary and country-led instrument International organizations shall consult ... countries to produce and validate ... estimates before publication ..." (UN, 2017). While countries were encouraged to submit Voluntary National Reviews, these reviews varied in scope and detail, and rarely provided data on all education targets.

SDG monitoring data were not readily available in most national education statistical agencies. The new 11 global indicators referred to undeveloped measurements, or datasets with partial global coverage. Indeed, missing data and proxy measures have become a global monitoring norm in the post-2015 period.

Another important shift involved calls to use “nationally determined benchmarks” to track country progress of SDG4 targets. The Education 2030 Framework for Action (adopted in Incheon) called on countries to establish “appropriate intermediate benchmarks (e.g., for 2020 and 2025)” for SDG indicators, seeing them as “indispensable for addressing the accountability deficit associated with longer-term targets” (UNESCO, 2015, para 28). The 2030 Framework implicitly recognized the fact that, although countries committed themselves to the same education targets and global indicators, they wanted their progress to be assessed based on an existing starting point and according to known (historical) rates of progress. In short, rather than using a common endpoint within a set time frame to assess the distance a country needs to move to achieve a specific goal (as was the case under EFA), national benchmarks would capture the contribution each country would be prepared to make to the global education agenda. Getting countries to engage in the SDG4 benchmark-setting process has not been easy. Apart from EU and CARICOM members, who had already committed themselves to clear targets, only half of all remaining countries either submitted national SDG4 benchmarks or committed to do so in the coming year (UNESCO, 2021).

The unprecedented ambition of the SDG4 agenda has certainly experienced a significant deflation with the onset of the Covid-19 pandemic. Countries have closed schools, disrupting teacher-student interactions and the regularity of school-based routines. Pre-existing global inequalities have widened and entirely new gaps have been created. Learning loss, lower retention rates, and a significant increase in out-of-school children and adolescents have all become tangible outcomes of the pandemic, even if it subsides. Policy responses to COVID-19 have demonstrated just how much global leaders rely on tables, figures, and current statistics for guidance in making critical and time-sensitive decisions. A lack of reliable, real-time data has been a key barrier to understanding the full educational impact of COVID-19. Some estimates suggest that the disruptions caused by COVID-19 may have set the world back many years in terms of educational gains. Getting education systems back on track will be difficult (UN, 2021).

One could argue that it is precisely during unprecedented and disruptive times that trusted, independent sources of data, evidence and analysis are needed to ensure smart and effective decisions. The GEM Report would appear to be well-positioned to adjust its evolving monitoring agenda and address unforeseen challenges such as those currently facing national authorities, donors, NGOs and other education advocates due to the COVID pandemic. Pressures on national budgets, partly due to increased health outlays, have reduced funds for international development assistance. By 2020 it was clear that squeezed budgets in OECD countries had translated into reduced financing for global education (UNESCO, 2020a). In response, the GEM Report platform prepared a series of policy papers providing revised funding estimates required to meet the SDG4 targets by 2030 (UNESCO, 2020b), as well as guidance to inform decision makers seeking financing solutions (UNESCO, 2021). These publications, along with previously published GEM Reports, helped inform the direction of the Global Education Meeting held in Paris France (UNESCO, 2020b), ultimately resulting in the 2020 Paris Declaration—a global call to invest in the futures of education.

By continuing to be responsive to the global education community as a whole, rather than the interests of individual agendas, the GEM Report can strengthen its role as an integral pillar of the global education architecture. Over the past 20 years the Report series has leveraged its independence to bring diverse ideas and perspectives to global education actors and policy makers. In the coming years, the headwinds facing the implementation of the 2030 education agenda are acute. For many this is a time to pause, take stock, and re-prioritize. A global education monitoring report series of high quality—one that is nimble, but steady; one that both informs and provokes—as new strategies are considered is a crucial asset. Whether this global good will be resilient or squandered remains to be seen.

Introduction

Following early scholarship on NGOs in the 1990s, the NGO sector has undergone dramatic changes that call for fresh approaches to research and theorization. Robert Arnove's edited volume *Philanthropy and Cultural Imperialism: the Foundations at Home and Abroad* (1982) marks the first significant study of the non-profit sector in the field of international education. Since then, scholarship on the topic has expanded greatly with exciting new research from the field and from disciplines of anthropology, sociology and political science. One of the challenges of theorizing the NGO sector is its highly pluralistic character that encompasses multiple organizational forms with diverse missions and histories. The diversity of the NGO sector has generated several acronyms to distinguish between different types of NGOs such as CBOs (community-based NGOs), GROs (grassroots organizations), INGOs (international NGOs) and even GONGOs (Government NGOs).

The heterogeneity of the NGO sector notwithstanding, a persistent and common feature is the power inequity between Northern and Southern NGOs. At a basic level, the hierarchies are constituted by donor or aid INGOs based in the Global North and recipient or beneficiary NGOs located in the Global South. The former determines the flow of funding to the latter, creating a dependence on external aid and donors for Southern NGOs to staff and sustain their work. A critical body of scholarship has examined these power differentials and argued that NGOs are part of the problem rather than the solution to global poverty and inequality in the ways that they reproduce relations of patronage, neocolonialism and imperialism. These critiques are also reflected in discussions that have taken place within INGOs of ways to restructure and reform the NGO sector to be more equitable and reverse power imbalances between Northern and Southern NGOs. OXFAM and Action Aid for example, are two prominent INGOs that more than a decade ago made operational changes to allow for greater autonomy and leadership to their regional offices in the South (Scott-Villiers, 2002; Eade, 2004).

More recently, in a context where the Black Lives Matter movement has brought into focus racial capitalism on a global scale, calls to "decolonize" the NGO sector are on the rise by activists and NGO workers, including by international NGO staff based in the North (Busby, 2021; DeLuca and Williams, 2020). These recent developments require a careful accounting of NGOs to ask what "decolonization" would mean for different kinds of NGOs. The essay maps important trends in the NGO sector and the undeniable influence of neoliberal capitalism on the internal workings of the sector in the North and the South. We discuss key themes in the critical scholarship on NGOs that inform theory, policy and practice in the sector. We highlight significant challenges posed by the corporatization of aid and philanthropy that have transformed the development aid architecture with implications for the NGO sector worldwide. The following section outlines the conceptual approach that informs our analysis of the NGO sector. We explain how Gramsci's theorization of state and civil society offers a more appropriate framework to theorize the NGO sector in contrast to liberal political theory that is unable to adequately explain the evolution and nature of the sector. The third section elaborates upon critical scholarship on the NGO sector starting in the nineties and highlights the important contributions of the multi-disciplinary and geographically diverse critiques of the sector. The fourth section is on the rise of venture philanthropy as a recent phenomenon that has radically disruptive consequences for the NGO sector and its functioning. Drawing on existing literature and our own research, we discuss the neoliberalization of the NGO sector in greater detail as well as its latest iteration as venture philanthropy has led to a new architecture of development and restructured the NGO sector. For one, we argue that this mode of philanthropy has enabled powerful corporations to become agenda setting actors, subordinating NGOs to implementation agencies with limited leverage in the global arena that nonetheless play a complex role in generating "consent" and legitimacy for a corporatized social order. In conclusion, we critically examine calls to decolonize the NGO and aid sector to understand its limits and potential for more egalitarian and just practices, structures and relations. What does a demand to "decolonize" imply for INGOs such as USAID, DfID and IRC that are closely tied to imperial states and their interests? What would a genuine decolonization entail for the NGO sector more broadly? These are questions we engage to conclude the essay.

A Gramscian conceptual framework

The global reach of the NGO sector, governing almost every aspect of development, has drawn the attention of scholars and researchers for more grounded and rigorous theorizing that is both contextually specific while also offering general insights about the phenomenon. Liberal political theory that analyzes state and civil society as separate and distinct spheres tends to locate NGOs as part of civil society, separate and autonomous from state and market (the latter also conceptualized as part of civil society). Research studies within this framework study NGO relations and processes as voluntaristic and self-driven, emphasizing individual organizations and leaders as the primary actors that shape the field, at times in fraught relations but in a general equilibrium with state and market forces. An example of such work can be found in the writings describing BRAC and Mohammed Yunus that promote micro-credit NGOs as a universal and normative model to address global poverty (Yunus, 2007). A second conceptual approach to the study of NGOs is neo-institutionalism that applies the principles of organizational analysis to examine the rules, norms and institutional dynamics that shape the work of NGOs and the actions and choices of its actors (Edwards and Fowler, 2002; Lewis, 2007; Schoenefeld, 2021).

Critical scholars of NGO studies (including authors of this essay) posit that these theoretical frameworks are limited in their capacity to account for the growth and influence of the NGO sector or explain the dynamics by which the sector has emerged as a powerful actor that shapes global policy on health, education, and the economy. We propose a dialectical approach that considers NGOs as one albeit important node in the “structuring structures” of states, finance capital, multilateral institutions of the World Bank and the IMF and a diverse range of social movements. This departs from the orthodoxy that locates NGOs exclusively as an actor in civil society understood as separate from and often antagonistic with the state. Instead, we suggest a Gramscian approach in which the sector is theorized as part of the broader political economy of global capitalism where state and civil society are in a dialectical relation, with the former representing relations of coercion and the latter the arm of consent (Gramsci, 1971). As organizations of civil society, NGOs function more often than not as this arm of consent and perform the important function of legitimating the dominant political and economic order. Moreover, the nature of the state and the overall policy and social movement context has a determinate influence on the nature, size and efficacy of the NGO sector that makes regional specificity a consequential factor in one’s analysis. As such, the role of NGOs must be theorized not in static and ahistorical terms but as contextual and in a dynamic relationship with other aspects of the economy and society (Kamat, 2013). As we illustrate in this essay, changes in national contexts and the global political economy have consequences for the “relative autonomy” (to borrow Bourdieu’s formulation) of NGOs that range from limiting aid and funding to NGOs to transforming the nature and scope of their work. Following Gramsci’s thesis that hegemony is never a complete exercise, we also highlight the mobilization of oppositional discourses that seek to counter and resist the widespread neoliberalization and corporatization of NGOs.

Critical scholarship on NGOs

The international political order of the 21st century is dominated by the “neoliberal turn” (Harvey, 2006) that propagates the doctrine of market principles in all sectors of society. Neoliberalism as a global policy regime is traced to the Thatcherism and Reaganism of the 1980s, and the growth of the NGO sector is understood in large part as an outcome of the austerity politics that was inaugurated in this period. As policies of deregulation and privatization were imposed on the global South by World Bank/IMF structural adjustment programs (SAPs), the state relinquished its responsibilities and obligations in providing healthcare, education, and other social services. As privatization and deregulation became the norm, impoverishment and prolonged suffering increased for so many living in the so-called developing world, thereby creating conditions ripe for expanded NGO intervention and “development” (Hancock, 1989; Kajimbwa, 2006). NGOs quickly filled this space of providing public services that previously were the responsibility of the state.

Since then, a rich body of scholarship has evolved that theorizes how NGOs are a key feature of neoliberal globalization disputing the characterization of NGOs as simply expressions of democracy (Bernal and Grewal, 2014; Elyachar, 2005; Ferguson, 2006; Fisher, 1997; Kamat, 2002, 2004; Karim, 2011; Mercer, 2002; Schuller, 2013; Sharma, 2008; Silova and Steiner-Khamisi, 2008). Several scholars have documented how NGOs have proliferated under neoliberalism while intensifying competition for funding and international aid. NGO-led social and educational programs increasingly adhere to market principles and are tied to corporate actors (Bhanji, 2008, 2012; Srivastava, 2010; Moeller, 2020; Tarlau and Moeller, 2019). With funding from northern multinational organizations such as the World Bank (WB), the International Monetary Fund (IMF), the United Nations (UN), and other international donor agencies flowing to the global South, neocolonial dependency is maintained under the guise of democratization. Scholars have compared the work of the NGO sector to that of missionaries and colonial voluntary organizations and have argued that NGOs function as a tool for geopolitical and economic control (Manji and O’Coill, 2002; Petras, 1999). Accompanying this disparity of economic control and who determines the funding priorities have been calls for further investigation into where that funding goes, and who it benefits (Barghouthi, 1993; Maran 2006). In this way, NGOs represent an important vector in legitimating and consolidating neoliberalism and neocolonialism in structural and ideological ways.

In much of the literature of the 1990s, NGOs were increasingly positioned as watchdogs of the state and as part of an “emerging civil society,” as the official agenda of development aid and development discourse shifted toward promoting “democracy” and “good governance” (Mercer, 2002; Choudry and Kapoor, 2013). This period marked an intensification of neoliberalism, and development was seen as emerging from the triad of a balanced relationship between “government, market and the third sector,”

ushering in the empowerment of NGOs as powerful agenda-setting actors on the global stage (Lewis and Kanji, 2009). In an environment shaped by global trade, neoliberal policy regimes and national policy frameworks, NGOs became effective mediators of the “new policy agenda,” pursuing goals that coalesced with global capitalist interests (Fisher, 1997; Kamat, 2004). Backed by substantial foreign aid, NGOs became seen as “agents of democracy” that would usher in Western-type liberal capitalist regimes to so-called “transitional” countries. Based on their in-depth study of NGOs in post-Soviet contexts, Silova and Steiner-Khamisi argued that in these contexts, NGOs played “complementary, cooperative, or surrogate” roles (Silova, 2008, p. 27) in relation to the state, and that this role was one of navigating a messy middle ground—tasked by international donors to promote democracy and raise marginalized voices, while also contending with the on-the-ground realities of working with authoritarian states (Silova, 2008).

In the aftermath of the US invasion of Afghanistan, the role of the NGO sector has evolved further to that of “force multiplier,” in the words of Colin Powell, playing a critical role as part of the US government’s arsenal of war (Greenburg, 2017). In the so-called “War on Terror” the line between military, development contractors and NGOs has become increasingly fuzzy. Literally embedded in military Green Zones, the work of NGOs in Afghanistan, even accessing the sites they’re working with, is dependent on and inextricably intertwined with the military-industrial complex in which aid programs function as part of the security apparatus (Duffield, 2012). As development became increasingly subordinated to the US government’s defense and diplomacy agenda, there has also been a marked expansion of multinational companies and private contractors like Chemonics receiving a major share of development aid compared to the NGO sector (Bilmes, 2021; Nagaraj, 2015; Rohde, 2012).

NGOization

As NGOs have become an integral factor in hegemonizing global capitalism, the neoliberalization of the sector has restricted their capacity to engage in activism and advocacy. The term “NGOization” refers to the professionalization and depoliticization of social change programs and efforts that is increasingly evident in different parts of the world (Bernal and Grewal, 2013; Choudry and Kapoor, 2013; Ismail and Kamat, 2018; Kamat, 2003; Schuller, 2013, 2017; Jaoul, 2018). While NGOs have supported people’s movements and social justice struggles, the depoliticization of the sector brings NGOs into lockstep with neoliberal globalization, bending to market principles of efficiency, productivity and measurable targets. Scholars have argued that the professionalization and depoliticization of NGOs undermines autonomous people’s movements and shrinks the space for activism and movement organizations in the global south (Benin, 2014; Choudry and Kapoor, 2013; Ismail and Kamat, 2018; Jalali, 2013). Albeit, in contexts of illiberal states, NGOs may also be a source of support for people and offer a space for building democracy reflecting the dynamic and dialectical formation of the sector (Alvarez, 2009; Arafa, 2017; Silova and Steiner-Khamisi, 2008).

One of the key manifestations of the neoliberal mandate of efficiency are the short-term funding cycles that prioritize development goals directed by the global North, creating short-sighted priorities that measure targets and outcomes, rather than long-term development goals (Zencirci and Herrold, 2022). While NGOs are idealized as apolitical entities that “do good” without the constraints of government bureaucracy or the greed of the market, the requirements of short-term projects and funding cycles and narrow targets fosters an “audit culture” that undermines development as a long-term, integrated and intersectional process (Choudry and Kapoor, 2013; Vannier, 2010). A host of “buzzwords” and terminology such as “participation,” “empowerment,” and “local community” accompany donor-led goals, bringing into view the paradoxes of NGO work that continue to impose top-down solutions while co-opting spaces of contestation and resistance (Bernal and Grewal, 2014; Cooke and Kothari, 2001; Cornwall, 2007; Jaoul, 2018; Kamat, 2004; Leve and Karim, 2001; Reimann, 2006; White, 1996).

The NGOization of development has exacerbated social and economic inequalities at multiple scales. For one, it has produced a concentration of relatively well-paid professionals, often from the global North, in metropolitan regions of the global South. While Northern expats are highly paid and develop top-down programmatic responses far from the sites of implementation, staff from the South are often devalued in both their compensation and experience relative to their Northern counterparts. This notwithstanding, the NGO sector comprises a significant segment of the professional middle class in poor economically precarious countries. As a Zimbabwean NGO colleague of one of the authors’ noted: “Well, our work may not lead to alleviating poverty, but at the least it has changed the lives of the NGO workers and we now constitute the ‘middle class’ in Harare!” As local professionals opt for better-paid, externally funded, albeit unstable jobs in the NGO sector, NGOs also drain the public sector of teachers, doctors, nurses, social workers and other professionals. Thus, rather than contributing to the strengthening of public services and institutions, NGOs too often contribute to its opposite, expanding the market for private actors and subcontracting that undermines the goal of sustainable development as such (Ferguson, 2006; Kamat, 2004; Mercer, 2002; Schuller, 2017; Simmons, 1998).

“NGOization” has also significantly restructured how civil society interacts with the state and the market, whether in the case of guaranteeing the right to education, addressing climate crisis or gender justice movements. For example, a number of scholars have shown that while women’s NGOs gave visibility and strength to feminist struggles, as neoliberalism created more hardship for poor women, many of these same feminist NGOs became more engaged in survival struggles, rather than emancipatory ones (Alvarez, 1999, 2009). Over time, women’s struggles transformed into efforts to simply integrate poor women into the market primarily through micro-finance and debt entrapment (Elyachar, 2005; Karim, 2011; Roy, 2010). While in some cases NGOs may be allied to or emerge from social movements (Waghmore, 2012), one of the foremost consequences of NGOization has been the displacement of political and social movements from the public sphere as professional well-funded NGOs take their place (Choudry and Kapoor, 2013; Bernal and Grewal, 2014; Dauvergne and LeBaron, 2014).

The problematic promise of PPPs

While NGOs have historically partnered with government entities or global donor organizations, in the new millennium, public-private partnerships (PPPs) have emerged that signal a closer alliance between the private sector and NGOs. Arguably, the rationale for PPPs is the private sector has greater capacity and resources that should be leveraged for social good. The underlying assumption is that the private sector, NGOs and the state have a common interest in public welfare and development (Kamat, 2014). In her book "Shock Doctrine," Naomi Klein (2007) foregrounds the problem of the state outsourcing public services to the private sector—there are few or no consequences for private sector withdrawal, particularly during a time of disaster or crisis. This ability to withdraw from the partnership with few or no consequences also highlights the imbalance in the relationship or partnership between the private and public sectors. If the public is the "customer" so to speak, how do they negotiate with the private sector and stand up for what is rightfully theirs when these services disappear or are not of an adequate quality? Further, who is benefiting from these partnerships? In her study of PPPs in South Africa Mirafteb (2004) documents how PPPs function as privatization by stealth and aptly terms it as the "trojan horse of development" (see also, Robertson et al., 2012; Srivastava and Oh, 2012; Srivastava, 2010). In the authors' own experience as the executive director of a Kenyan NGO (Norman-Tichawangana), it was transparently evident that the PPP project disproportionately benefitted the private company rather than the poor women identified as the ostensible beneficiaries of the project. It was manifestly evident as well that with the help of the NGO, the company would be able to tap into an extensive rural poor market in the future. The following section elaborates upon the evolution of the PPP model in which finance and technology companies supersede NGOs in the design and delivery of education products and services in ways that portend a radical restructuring of education and development on a global scale.

NGOs and the new aid architecture

Intensifying the neoliberal reforms of the prior decades, the architecture of NGO funding began to further shift in the early 1990s. Three decades later, it is increasingly dominated by a mode of philanthropy known as philanthrocapitalism or venture philanthropy, which characterizes large swaths of the non-profit sector. Venture philanthropy signals a dramatic shift in NGOs, not only because of the sheer growth in scale and volume of philanthropic spending (McGoey, 2012; Olmedo, 2019) but also because it is thoroughly guided by logics of governance that simultaneously corporatize the economic, political and cultural spheres and concentrate enormous power in the hands of corporate actors to set the global agenda. It also introduces a new "common sense" that coalesces the idea that corporate interests are seamlessly aligned with, rather than in contentious and contradictory relation to the public good, and that corporate actors and the market are increasingly better positioned than states to effect social change, leveraging NGOs to do so. These logics thus have far reaching implications that have further restructured the NGO sector and escalated the neoliberal, corporatist ideologies and pressures that govern their functioning. This section provides a brief overview of Venture Philanthropy in the education sector and examines the implications it has precipitated for NGOs writ large.

Venture Philanthropy is known by many names but was first popularized as *Philanthrocapitalism* by Bishop and Green in 2008 in their book subtitled *How the Rich Can Save the World*. They argued for a "truly fair social contract" which "might actually allow the rich who give generously more grace than their peers to indulge themselves free from criticism in their yachts, space flights, and Rod Stewart-serenaded birthday parties" (p. 484). At its heart, venture philanthropy espouses the idea that ultra wealthy actors can do "well" financially by doing "good" (Bishop and Green, 2008). In doing so, "philanthrocapitalism" seeks to obscure the relationship between poverty and wealth and eschews their inextricable connection within an unequal global capitalist system wherein the wealthy "have captured so much of the benefit of the growth of the global economy" (p. 542).

Venture philanthropy is distinctive in part because it is not only funded by billionaire venture capitalists but because it employs the principles and practices of private investing, fundamentally transforming traditionally non-profit sectors like education (Olmedo, 2019; Saltman, 2010; Tarlau and Moeller, 2019). While scholars have shown how this mode of philanthropy represents a continuation of strategic corporate giving in ways that benefit their businesses (Tarlau and Moeller, 2019) as well as prior models of Corporate Social Responsibility that provide brand and PR benefits (Bhanji, 2008), VPs stand apart because they model their interventions on venture capital, market competition and business principles that are driven by economic incentive, and treat funding as financial "investments," seeking multiple kinds social and financial "returns" (Baltodano, 2017; Hites, 2019; Kumashiro, 2012; Saltman, 2010; Scott, 2009; Tarlau and Moeller, 2019). It is these profit motivations and mechanisms of venture philanthropy as well as the constitutive aim to make philanthropy a "lucrative industry in itself" (McGoey, 2014, p. 111) that distinguish it "in shape and essence" (p. 128) from earlier modes of philanthropy and charity (Olmedo, 2019). Scholars have highlighted in particular that while traditionally, the "legitimacy of philanthropy stemmed from the strategic ignorance of both donors and recipients of the opportunities for economic advancement" (p. 194) under this "new" mode of philanthropy, self interest is no longer disguised but is rather valorized and championed as not only justifiable but as a "prerequisite," that will ostensibly serve the wider public, indeed the world (McGoey, 2012).

In many ways, venture philanthropy is fundamentally contradictory because it is defined by what Lipman (2015) describes as "dialectic of disinvestment and wealth concentration" (p. 242). Scholars have brought attention to the extractive, colonial and imperial modes of dispossession and wealth accumulation that undergird "venture philanthropy." Embedded in venture philanthropy's very existence are systemic and structural inequities (e.g. mining for oil and minerals, mass deforestation, violation of human rights, environmental degradation and destruction, extraction of data/surveillance, exploitation of labor and digital labor

on platform economies, etc.) that maintain grotesque stratifications between the “givers” and the “given to” and primarily disenfranchise working class and communities of color both in the Global North and South. For example, the Gates Foundations’ revenue sources include endowments invested in companies like Dutch Shell and Exxon Mobil Corp “which are responsible for polluting the region [Nigeria] beyond levels permitted in Europe or North America” (McGoey p. 190) or corporations that have fueled health epidemics (such as McDonalds and Coca-Cola). Gates has also made his own personal fortune in part, amassed through exploitative labor practices. As disparities between the rich and poor have grown obscenely wider, corporations who fund social interventions have also deliberately resisted taxation responsibilities, which creates further social exclusions and most impacts those that corporate philanthropies claim to “give back” to (Baltodano, 2017; Barkan, 2011; Gurn, 2016; Lipman, 2015; Scott, 2009). In many ways, venture philanthropy disguises profit making investments as philanthropy (Saltman, 2018) and are directly implicated in creating and maintaining the inequities they claim to alleviate.

Implications for the NGO sector

In changing the locus of funding within the NGO sector, venture philanthropy is enacting what Lipman has called the “deeply colonial project” of shifting power and decision making further away from communities, giving corporate actors the enormous latitude to remake public systems in ways that exclude the most disenfranchised communities (Lipman, 2015). In doing so, they are also transforming the architecture and governing logics of the NGO sector.

Among the foremost challenges posed by this mode of “giving” is that it further deepens the anti-democratic tendencies of NGOs that maintain an unequal international global political economy. Venture philanthropy enables the billionaire class to disproportionately exert influence on local and national legislation and on public policy, with little to no public oversight or accountability (Baltodano, 2017; Saltman, 2010) at the same time as the claims of effectiveness and efficiency of foundation interventions have been contested (Srivastava and Oh, 2012). Such enormous power in the hands of venture philanthropists signals a further neoliberal structuring of society that erodes public accountability and profoundly risks any possibility of an independent social and advocacy mission for NGOs. One such example is the World Health Organization’s malaria program that is so heavily dominated by funding from the Gates Foundation that it risks compromising the WHO’s independence and as such, public health as a whole (McGoey, 2012). This was also demonstrated in the context of the ongoing Covid-19 pandemic, during which Bill Gates, who came out in favor of vaccine patents, “mobilized his immense personal wealth and power to ensure that the interests of for-profit drug companies prevail over global public health” (Savage, 2021).

Venture philanthropy also represents a more seamless suturing together of corporate interest and NGO sector as corporate sector actors themselves enter into NGOs and the space they occupy and as NGOs function more and more in corporate-like ways. Unlike earlier, traditional “hands off” forms of philanthropy, venture philanthropists play a more “hands on” role in getting directly involved in their investments—in goal setting, decision making, evaluation, etc., giving them greater control over the reform process (Kumashiro, 2012; Saltman, 2010) and in precipitating large scale transformations. This in turn has placed disproportionate emphasis on measurable “data” and quantification within NGOs, a device that dominates the corporate sphere. Consequently, sectors like education are read in data-driven, narrow, decontextualized ways and draw on technocratic rationales to define “success” in terms of “return for investment” or “value,” amplifying tendencies that accompanied the NGOization of the sector. As such, NGOs are often answerable to metrics and performance indicators not only to donor NGOs but to corporate actors that seek tangible, quantifiable improvements geared toward marketization, entrepreneurship and commodification. As corporatization in the NGO sector becomes more hegemonic, a qualitative shift has taken place as NGOs become thoroughly guided by the same logics that drive venture capital and the boundaries between business and philanthropy become more and more indistinguishable. The role of the state in the corporatization of the NGO sector also cannot be understated, as governments have facilitated or directly funded corporations, forming a powerful nexus of “state-market” hybrids with which NGOs interact in complex ways (McGoey, 2014).

Many VP-backed initiatives have also been able to garner grassroots “consent” and “technical consensus” from social and institutional actors by channeling the enormous financial resources, media power and networks at their disposal (Tarlau and Moeller, 2019). Examples, among numerous others, include the Gates Foundation’s single-handed role in “bankrolling” and creating wide political support for enacting the Common Core standards in the US, which demonstrated VPs extraordinary influence in shaping public policy, swiftly after which “Microsoft announced that it was joining Pearson, the world’s largest educational publisher, to load Pearson’s Common Core classroom materials on Microsoft’s tablet, the Surface,” allowing Microsoft to compete with Apple for school district monies (Layton, 2014). However, Tarlau and Moeller (2019) argue, writing in the context of curricular reform in Brazil, that their philanthropic influence is not simply geared toward profit maximizing but is rather, “an attempt by foundation and corporate leaders to garner power and influence on different scales, and re-make public education in their own image” (Tarlau and Moeller, 2019, p. 3). This disproportionate and hegemonic influence held by venture philanthropists over local, national and global agendas as such requires critical reflection on who and what constitutes the “grassroots.” As Mitchell and Lizotte (2014) have shown in the case of Seattle, corporate actors partake in a form neoliberal governance that relies on the moral authority of the philanthropic “gift” which creates a sense of ideological obligation toward the “givers.” What appears to be grassroots, participatory democracy upon closer observation can be traced to strategically funded institutional networks cultivated by philanthropic funding. Leveraging these networks to generate “consent,” venture philanthropy quickly brings even genuine grassroots demands that emerge from the systematic defunding of public systems and services into the narrow purview of market based solutions, furthering the consequences of “NGOization.”

Today, many corporate entities themselves are simultaneously helping aid and philanthropy initiatives directly while also funding a network of grassroots NGOs and conducting political lobbying to shape public policies that are conducive to their agenda. This both limits NGOs to act in the global arena and constrains their latitude in advocacy, reducing them to implementing organizations or subcontracting agencies that represent corporate and corporate foundation interests. Venture philanthropy seeks to solidify a “common sense” that corporate actors are better suited than states and NGOs to effect change, and so leverage them to stabilize their positions and legitimate global capitalism. NGOs play an important role in generating consent and consensus for a reconfiguration of relationships, institutions and subjectivities in order to facilitate market incentives to drive social change in service of a “socio/neoliberal” order (Olmedo, 2019).

A time of reckoning for the NGO sector

In closing, we wish to draw attention to two contradictory trends whose effects on the NGO sector needs further research and analysis. One, the rise of authoritarian rule in erstwhile democracies such as India, Brazil and the Philippines that have imposed punitive laws which radically delimit the scope and functioning of domestic and international NGOs. Parallel to this is the rise of militant right-wing and protectionist politics in donor nations such as France, UK and the US that impacts the extent and scope of aid to NGOs in the South (Davidson and Saull, 2017). A second contrasting trend is the centering of race and settler colonialism as a global issue, sparked by the long summer of Black Lives Matter protests in the US that resonated around the world. The NGO sector is responding to this moment, as evidenced by calls to review race relations within the sector and appeals to “decolonize” the NGO sector. Following a dialectical approach, it is important to reckon with the ways in which NGOs are likely to be impacted by these conflicting global tendencies. Equally important is to examine the ways in which NGOs address these emergent tendencies and how the sector can be supported as well as held accountable in this critical conjuncture.

The NGO sector appears to be one of the first casualties of democratically elected authoritarian governments such as India, Brazil and the Philippines, that represents a crisis of democracy with global repercussions. Governments in these countries have targeted reputed international NGOs such as Amnesty International, Human Rights Watch, Ford Foundation and Greenpeace and blocked their funding, harassed staff and closed down operations in the country (Amnesty International, 2019; Sherwood, 2015). The right wing governments have unleashed vicious campaigns of disinformation attacking NGOs as the source of political conflicts in the country. For example, in response to the widespread condemnation of his destructive policies in the Amazon, Bolsonaro has led media campaigns to attack NGOs as the source of political conflict (Watts, 2019). Similarly, Duterte alleged that human rights NGOs that raised the alarm on extra-judicial killings by his government, are linked to drug lords in the country (Human Rights Watch, 2018). Under Modi’s rule, in the last ten years, over 20,000 NGOs have had their licenses revoked prohibiting them from receiving foreign aid (Swart, 2020). Advocacy NGOs such as Amnesty International, Ford foundation, Greenpeace have been forced to close their offices and others to drastically reduce their in-country operations. In several countries, NGOs that depend on foreign aid to provide services such as education and health care to poor and minority communities have been surveilled, harassed and shut down (Arafa, 2017; Hecht, 2018; Mellen and Lynch, 2017). On the other hand, NGOs that are aligned with the states’ religious supremacist agenda in India and Pakistan have thrived in this period. In other words, the space for NGOs that challenge the human rights abuses of authoritarian governments has drastically shrunk in this decade. This is a moment of reckoning for the NGO sector that is contemporaneous with the crisis of democracy and raises questions about whether NGOs can fulfill their role as frontline defenders in the face of unprecedented repression from authoritarian states.

The second issue we seek to highlight is concerned with struggles against racism and settler colonialism that have precipitated a “reckoning” in the NGO sector and its related academic disciplines. Led by the Standing Rock Sioux tribe and Native Nations along with non-Native allies, grassroots protests that began in 2016 against the Dakota Access Pipeline gained extraordinary momentum and drew attention to the pervasive and powerful nexus of settler colonialism, white supremacy and racial capitalism that continues to create disproportionate harm and injustice for indigenous peoples. In 2020, the Black Lives Matter movement further exploded the myth of a post-racial US and has forced a racial reckoning within the NGO sector, including among established donor NGOs in the North. Following the protests instigated by the police murder of George Floyd, there were a flurry of statements that condemned racism and white supremacy within the NGO sector, including public criticisms of internal racism at prominent INGOs and bilateral aid organizations such as USAID, DFID, IRC and Doctors Without Borders (Busby, 2021; De Luce and Williams, 2020; McVeigh, 2020; Syal and Waterson, 2020), often coming from within the internal ranks of their organizations. Peace Direct’s (2021) recent report *Time to Decolonize Aid* also discusses the continued colonial systems, dynamics and epistemologies that continue to structure NGOs and INGOs, both between donors concentrated in the North and Southern NGOs as well as within the working cultures of these organizations under a guise of “neutrality.” As calls to action reverberated throughout the NGO sector and the field of development, important conversations about race, capital and power have resurfaced as foundations and grant-makers have been challenged by movements to interrogate both internal institutional dynamics and how they relate to recipients of aid in the South.

While the recent call for “decolonizing aid” seems to signal a more urgent appeal for progressive reforms within the NGO sector, it is also the evolution of an ongoing conversation around racial and geopolitical inequalities within the sector. In 1985, the charitable Live Aid concerts headed by Bob Geldof and other celebrities to raise funds for those affected by the famine in Ethiopia, set the stage for a culture of charitable giving that implored those in the global North to feel pity for starving children in “Africa” while failing to engage with the structural inequalities that created these conditions (Müller, 2013). In the context of the current moment, several INGO and NGO leaders are seeking to name and acknowledge systemic racism and engage structural and geopolitical

inequalities that shift power and go beyond earlier tokenistic and technical “fixes” that have been prevalent in the sector. The UK INGO Oxfam has sought to reframe the debate on aid in more fundamental ways by shifting the lens from poverty to wealth inequality and racial capitalism, recognizing that poverty cannot be addressed without also attending to how wealth is generated. Citing statistics such as the “world’s 2153 billionaires have more wealth than the 4.6 billion people who make up 60% of the planet’s population” they have begun calling for “deliberate inequality-busting policies” (Oxfam, 2020). Taking the lead from Vil-lanueva’s (2021) book *Decolonizing Wealth*, some foundations have begun to shift their practices to provide operational and unrestricted, multi-year and long-term funds to NGOs and sought to redistribute power and decision making to BIPOC led organizations and communities (DevEx, 2020). Other foundations and grantmakers have also sought to be movement aligned and movement accountable, and BIPOC have called for white leaders to be co-conspirators and shift the white “gaze,” and reconceptualize aid as reparations in the context of historical and ongoing dispossessions, challenging the notion of “helping” that is so constitutive of the philanthropic industry (Decolonizing Wealth Project, 2021).

Laudable as these efforts are, the speed and fluency with which “decolonization” has quickly been taken up by the NGO sector ought to give us pause. As Tuck and Yang (2012) caution, the “easy absorption, adoption, and transposing of decolonization is yet another form of settler appropriation” (p. 3). For the INGOs and aid organizations that represent imperial interests such as USAID and DFID, a genuine “decolonizing” would require thoroughly breaking from the fundamentals of the aid and development industry, including from the military-aid-industrial complex, from neoliberalism and financialized capitalism and from the role NGOs play in enforcing and sustaining deeply rooted structures of domination. Particularly for donor organizations and institutions located in the North, decolonization would require recognizing the connections between settler colonialism “here” and imperialism “elsewhere,” and as such, the *actual* “repatriation of indigenous land and life” (Tuck and Yang, 2012, p. 21). For academic fields and institutions implicated in colonial histories and benefitting from settler colonialism, it entails a “systemic overhaul” and destabilization of existing academic systems as well as reparations, epistemological & ontological disruptions and interrogations of the policies and practices of Northern states. As international development and education scholars have pointed out, fields like international education “are falling short of any genuine decolonization efforts” and questioned whether “decolonization” is “within our grasp” at this juncture (Ghaffar-Kucher, 2019, p. 2). For recipient NGOs in the global south, re-evaluating partnerships and forging ever important alliances with social movements, unions, and activist organizing to simultaneously challenge hegemony of Northern NGOs as well as authoritarian regimes and foster alternative institutional and political possibilities will remain an ongoing task. While continuing the indispensable work of forging solidarities and alliances, it will also be incumbent on those in the sector not to homogenize the specificity of movements and histories, lineages and demands, including demands to recognize the “incommensurability” of decolonization with other movements of social justice (Tuck and Yang, 2012). Bearing in mind, as Ruth Gilmore highlights that the majority of philanthropy stems from “repositories of twice-stolen wealth—(a) profit sheltered from (b) taxes” and in the case of the US, “thrice-stolen, considering the foundation of the American state on the theft of Indigenous lands” (Kanj, 2021), in this moment of reckoning, how would understandings of justice and NGO strategies shift if NGOs were accountable to this reality? Calls to “decolonize” NGOs and aid warrant asking questions with no easy resolutions and contending with the epistemological and material transformations that consequences of decolonization entail. With a deeper structural critique in mind, we ask, what is the NGO sector ready to relinquish in order to break from reproducing the settler colonial project and imperial modes of dispossession and injustice to stand with those whose interests they seek to represent?

We offer these reflections and their implications for NGOs that merit further discussion among scholars and practitioners. As various crises of neoliberalism coalesce and precipitate social and political upheaval, paving the way for authoritarian regimes, NGOs play complex and contradictory roles where they can be further incorporated in service of global capital and the dispossession and expropriation that are constitutive of it. Whether progressive NGOs will be able to maintain “relative autonomy” (Bourdieu, 1983) and be allied with critical struggles and demands for racial and economic justice will depend on whether the sector is able to navigate an increasingly treacherous and challenging environment to enable a transformative politics.

Introduction

The COVID-19 pandemic has not changed the fundamental challenges to education. However, like in other areas, it has aggravated long-standing problems and placed many issues, especially inequality, in relief. The pandemic has deepened existing inequalities, and, in some cases, it has reversed progress. It has, for example, jeopardized important, if inadequate advances in areas like the education of girls and the elimination of child labor. The pandemic and associated crises have also served as an excuse for many governments to push the achievement of the Sustainable Development Goals (SDG) including goal 4 on education, further down the road. Achieving the goal by 2030 would represent a major shift in investment toward the public good and would enable education to come closer to playing its irreplaceable role in equipping young people to cope and thrive in a rapidly changing world.

One of the crises exacerbated by the pandemic is exclusion, whether it is persons with disabilities, refugees and migrants, indigenous peoples, LGBTI persons, religious minorities, or many others. It has boosted an already unacceptable level of violence against women, intensified discrimination, and dampened opportunities. Given these challenges, education needs to address and remedy inequalities in education, but also maximize its equality impact on the larger community. However, the impact of the pandemic goes far beyond equality. The democracy crisis has gotten worse as well. In 2020, Freedom House published a report ([Repucci and Slipowitz, 2020](#)) that showed that in 80% of countries, the situation of human rights and democracy had weakened. That was particularly for freedom of expression and freedom of association. Trade unions, including education unions, have been engaged in the fight for democracy in repressive countries and others where democracy is weak. Many activists have been imprisoned. Some have been killed.

Although this chapter will not dwell in any detail on the pandemic, it is relevant and will remain relevant to ongoing concerns in education long after the virus has subsided. Those lasting impacts will be reflected in the state of the education system. It will include the challenges already mentioned, but also the question of how to deal with the quantum leap in the use of education technology caused by the rapid adoption of distance learning, most often without consultation with teachers and their organizations. One of the challenges will be how to take advantage of technology to reduce workloads and streamline administration rather than using it in pedagogy in ways that would damage the quality of teaching and compromise the autonomy and role of professional teachers.

The lasting impact of the pandemic will depend on whether the many lessons from it have been learned and can improve education systems. That means, among other things, lifting the status of teachers and raising the priority of financing education which has

become urgent after so many years of neglect. This paper provides an account of the ways in which Educational International interprets the deep challenges facing education around the world, seeking to put the voices of the teachers at the heart of the global conversation and advocacy for educational reform. As a non-government organization (NGO), representing the profession, it contests the understanding of education represented by some leading intergovernmental and corporate organizations.

What is Education International?

Education International (EI) is an international professional trade union organization. It is a global union federation (GUF) with 383 member organizations in 178 countries and territories. They, in turn, represent more than 32 million teachers and other education staff. EI is one of the largest of the eight Global Union Federations, which represent workers by sector and occupation. In addition to GUFs, there are two international trade union bodies linked with GUFs that represent multi-sector national centers. They are the International Trade Union Confederation (ITUC) and the Trade Union Advisory Committee to the OECD (TUAC). Their role and membership are different from GUFs. The ITUC and TUAC share common values with the GUFs, but all are autonomous from the others. They cooperate, including in the Council of Global Unions (CGU), but are governed by their member organizations according to their respective Constitutions.

The highest authority in EI is the Congress, which meets every four years. All member organizations are invited to attend. The Congress elects the president, vice-presidents (one from each region), the general secretary and the other members of the Executive Board. The Executive Board governs EI between Congresses. Regional structures and other bodies also contribute to its governance (2021). The general secretary is the only member of the Executive Board who is a full-time employee of the organization. He/she is assisted by secretariat staff at the Brussels headquarters and at regional offices.

To respond to specific needs of education sectors, meetings are held, research performed, and information is circulated, and the organizations' views are advocated in the international community. The bulk of members are in primary and secondary education. They are the best organized and have the highest employment. Other sectors include early childhood education, higher education and research, technical and vocational education and training, and Educational Support Personnel. Democratic procedures are laid out in the Constitution and By-Laws, which are adopted and amended by Congress. There are also By-laws for the regional organizations.

Education International is financed by fees paid by member organizations based on the number of members. Contributions per member are not the same for all organizations, however. There is a scale based on GDP so that fees correspond to ability to pay. Membership fees finance the secretariat and much of EI's work. However, some member organizations make additional contributions for solidarity and capacity building work in to support education trade unions in low-income countries. That is an important part of the work of Education International. This support includes trade union education and other capacity building programmes or solidarity assistance when member unions confront emergency situations. Most of the resources required for capacity building are provided by national education unions in Europe, North America, Australia, Japan, South Africa, and others that maintain their own international solidarity funds or have access to public development resources.

Support is partly financed by EI's solidarity fund to which member organizations contribute on a voluntary basis. This fund also receives a percentage of EI's annual income. There are appeals to member organizations for emergency relief. The EI solidarity fund also provides assistance when member unions and their members are struck by disasters such as armed conflicts, terrorist attacks or natural catastrophes such as earthquakes and floods. One major example is from 2004 when Indonesia, Sri Lanka and Thailand were struck by a tsunami taking the lives of some 2500 educators and destroying many school buildings, Education International provided financial support to thousands of individual teachers and financed the re-construction of schools in Atjeh and Sri Lanka. This effort was also supported financially by Oxfam Netherlands.

History of EI

Although teacher organizations were already created in a few countries in the 19th century, international teacher organizations go back to the first decades of the 20th century (Windmuller et al., 2019). At that time, most of their members were professional associations, not trade unions. However, there were global trade union organizations in other sectors as well as global bodies representing national centers. Their evolving structures and histories are relevant to the development of global trade unionism in education. Of the modern Global Union Federations, the oldest is the International Transport Workers' Federation (ITF), which was founded in 1896. In transportation, global connections of workers are related to the fact that most of its sectors cross borders. The maritime industry was always global. Railways, civil aviation, and road transport are also international.

For teachers and others working in education, there were not those clear global links in the early years. In addition, for many, including governments, trade unions were seen as being for manual workers and not professionals. At that time, some teachers did not consider that it was appropriate for them to be in trade unions. The founding organizations of EI were the International Federation of Free Teacher Unions (IFFTU) and the World Confederation of Organizations of the Teaching Profession (WCOTP), both with roots going as far back as before WWI.

In 1945, the World Federation of Trade Unions (WFTU) was formed by national centers (Windmuller et al., 2019: 72). It created sectoral structures called Trade Union Internationals (TUI), which were subservient to it. When it became clear that the WFTU was, in fact, controlled by the Communist Party of the Soviet Union, the strongest International Trade Secretariat (the name for GUFs

until 2002), the ITF, decided to remain independent and keep control of the organization in the hands of their affiliated unions. Independent and democratic trade union national centers left the WFTU and founded the International Confederation of Free Trade Unions (ICFTU) in 1949.

Prior to the formation of EI in Stockholm in January of 1993, there were four global trade union organizations for educators, the social democratic IFFTU, the Christian World Confederation of Teachers (WCT), the Communist World Federation of Teachers' Unions (FISE—French initials) and the non-aligned WCOTP (Windmuller et al., 2019: 75). IFFTU and the WCOTP agreed that the new international would be composed of free and independent trade unions and associations. All existing member organizations would become members of the new organization and were expected to subscribe to the international's principles and goals. However, EI created an independent Committee of Experts that could examine member organizations to ensure that they met the criteria for membership as well as, where needed, examining trade unions seeking to join the organization. That Committee is unique among the global trade union organizations. Based on the work of that Committee, some of the original EI members were expelled.

With the collapse of the Soviet bloc in 1989–1990, many teacher organizations in the former communist countries became democratic and independent from government and left the FISE. The European members of the WCT joined EI in 2004 followed by the rest of the organization's members (Windmuller et al., 2019: 88). The WCOTP long saw itself as a professional organization and IFFTU was a trade union organization from its origin. However, already some years before the formation of EI, many of the professional organizations at the national level also saw themselves as trade unions. Many trade unions also focused on professional issues and on quality education and equitable school systems. Some of the European teacher organizations became members of both the IFFTU and the WCOTP prior to the merger. This dual function, to defend the wages, conditions, and rights of workers in education as well as the status of the profession and the promotion of quality education, is one of the strengths of EI and something that makes it different from most other GUFs.

Education International and multi-lateral institutions

An important job of Education International is speaking for its member organizations and the people that they represent. It is their global voice. Although member organizations are often involved in international work, it is organized and coordinated by EI. In the United Nations system, EI intervenes with several parts of the UN in addition to many of its specialized agencies. That includes the UN General Assembly and the UN Special Envoy for Global Education. A major focus of that work has been the adoption of the Sustainable Development Goals for 2030, especially SDG4 on education.

Among the UN specialized agencies, there is extensive cooperation and involvement with UNESCO on the full range of education issues for which they are responsible. EI participates in many consultations and Conferences. EI and its predecessor organizations have also worked with the International Bureau of Education, a center of excellence in curriculum and related matters founded in 1925, which is now part of UNESCO (IBE-UNESCO).

EI works closely with the International Labor Organization (ILO) on education sector issues, but also on more general trade union concerns. It uses its complaint mechanisms when there are government attacks on freedom of association and collective bargaining. Another important agency is the Office of the High Commissioner on Human Rights (OHCHR) in its different fora and activities, including its extensive system of special rapporteurs. Among them are the Special Rapporteurs on the Right to Education. Other agencies where there is some contact and cooperation include UNICEF, UNGEI, WHO, UNDP, UNFPA, UNHCR, and UN Women.

There are several non-UN international organizations that are important to the work of Education international too. They include the Organization of Economic Development and Cooperation (OECD). The OECD conducts several extensive surveys and performs research in many areas. They also work closely with education ministries. EI works with the OECD on their full range of education activities. EI chairs the committee that is responsible for education in the Trade Union Advisory Committee of the OECD as well as maintaining its own committee and other direct contacts and cooperation. The OECD and EI co-organize the annual International Summits on the Teaching Profession. In cooperation with ITUC and TUAC EI also contributes to the preparation of the G7 and the G20. EI consults with the Education Ministers of the G20. Another body that is important to education policy and funding is the Global Partnership for education (GPE). GPE works with 76 lower-income countries to help them build stronger, more effective education systems. It is a multi-stakeholder initiative largely funded by governments. EI serves on the Board of Directors and works closely with the secretariat and other partner organizations.

The World Bank is the largest donor to education. Among the intergovernmental bodies. However, it has a long record of supporting privatization of education and of encouraging the involvement of nonprofessional teachers, including volunteers and "informal" teachers. They, often in agreement with the IMF, have not supported adequate funding for public education and have tried to limit salaries for teachers. Even as EI's relationship with World Bank is contested one it meets the Ban regularly, sometimes with the assistance of the ITUC/Global Unions Washington, DC office. It also works with its member organizations on World Bank issues. They, in turn talk with their governments. As an example, the US member organizations and the government with the assistance of Congress were able to get the World Bank to suspend direct or indirect investments in private, for-profit pre-primary, primary, and secondary schools (Edwards, 2020a,b).

As trade agreements have expanded to services, EI and Public Services International (PSI) have worked to ensure that agreements do not open public services to private investment and control or insulate privatized services from becoming publicly controlled or limit the right to regulate of governments. A major trade agreement on services was negotiated before the World Trade Organization

(WTO) was established in 1995 under the General Agreement on Tariffs and Trade (GATT). The General Agreement on Trade in Services (GATS) is far-reaching. While there continue to be concerns about the impact of GATS on education and health care and other issues, however some of the most dangerous provisions that would have undermined public services and government sovereignty were not included. There have been no service agreements negotiated in the WTO, however, there is a “plurilateral” negotiation underway since 2013, the Trade in Services Agreement (TISA). The agreement has been criticized for being negotiated in secret. Opposition has grown and the process may not yield results.

Although the WTO does not set standards on intellectual property, it is responsible for the Trade-Related Aspects of Intellectual Property Rights (TRIPS), which came into effect in 1995. Intellectual property protections became an issue related to the production of antiviral medications to be used against HIV/AIDS. The controversy led to the adoption of the Doha Declaration in 2001 that provides for flexibility in public health crises. The crisis in availability of COVID-19 vaccines led over 100 nations to call for a temporary waiver of intellectual property protections at the WTO, which would allow for low-cost production in developing countries. EI and other Global Unions have been actively supporting the waiver. It is an issue that is likely to continue to arise with other vaccines and life-saving medications. Although the WTO acts to protect intellectual property rights, it does not adopt the standards. They are made by the World Intellectual Property Organization (WIPO). EI has supported education and research exceptions for reasonable use for copyrighted materials in education. That is already provided in national law in many countries, but in others, teachers risk running afoul of the law if they use copyrighted materials in the classroom. With distance learning, copyright restrictions often become even more complicated in education.

EI and its regional organizations also work with regional inter-governmental bodies on education and other issues. Institutional structures are further developed in Europe than in other regions. Relevant bodies include the European Commission, the Council of Europe (which reaches beyond the European Union), the Bologna process in the European Higher Education Area and the Erasmus program, also in higher education.

Trade unions

Like all free and independent trade unions, education unions are an instrument for workers to defend their interests as they define them. They are distinguished from other groups, corporations, or individuals that express views or advocate policy because they are representative and have a legitimacy that only a democratic mandate can provide. Leaders and members of governing structures are elected based on one member, one vote. This gives workers a collective power that they would not have as isolated individuals. That enables them to gain respect and protect their human dignity.

Trade unions also share a central concern for human rights. Although they support the full range of human rights, they focus on “enabling rights”. Such rights include freedom of association, the right to organize, and the right to collective bargaining. They are enabling because they make it possible for workers to obtain other human rights, including health and safety protections, child-labor and forced labor free workplaces, and to confront all kinds of discrimination. Freedom of expression is related to the exercise of those rights and is also an enabling right. The human right to education is an important and relevant enabling right. It opens doors for students and enables them to effectively exercise other rights as well as having better access to opportunities and more fully participate in their communities.

The mandate of Global Union Federations, including EI, comes from their member organizations at national level. That means that the priorities of EI are based on national preoccupations. Education is controlled by authorities at national level (in some case, by regional or local bodies); however, global integration and rapid communication has meant that developments in one country affect others to a larger extent than in the past. Good and bad ideas are more contagious than was once the case. The job of EI is not the same as that of national unions, but EI is an extension of them and carries their priorities into the international arena. A good flow of information and cooperation are important to understand the impact of other global forces on national systems of education.

Long before the establishment of teacher unions, the trade union movement supported free, universal, public education. It was seen as an important means to increase social justice and to reduce the penalties that children may suffer because their parents are poor, are not educated, or do not speak the national language or do not speak it very well. In countries that have a strong tradition of immigration, education has been a key factor in the integration of new populations. In the United States, for example, the first inter-sectoral trade union body was created in 1827 in Philadelphia. One of their first policy positions was on free public education. They declared that they sought, “a system that will fit the children of the poor as well as the rich to become our future legislators, a system that will bring the children of the poor and the rich to mix together as a band of Republican brothers”.

Trade unions and the teaching profession

There are many issues that define the “status” of the teaching profession. They include a common understanding of the purpose of education, professional autonomy, participation of teachers and their organizations in systems of education, and good-quality training in preparation for and during teaching careers. They also encompass fair treatment and salaries and conditions that are equivalent to similarly qualified professionals.

Schleicher (2018: 1), Director for the Directorate for Education and Skills of the OECD, outlined some key elements of being a professional in his foreword to the report for 2018. He wrote:

A 'professional' is someone who is able to use their expertise to make decisions about their work, who has the autonomy to act on those decisions, and who contributes to the body of professional knowledge. Such decisions and actions are grounded in a specialised set of knowledge and skills, stemming from both quality training and from the constant collaboration with peers and other stakeholders. For teachers and school leaders, professionalism means not only conducting their work in an effective manner, but working to improve their skills, collaborating with colleagues and parents, and thinking creatively about the challenges they face.

In 1966, the international Labor Organization (ILO) and UNESCO (1966) adopted the *Recommendation concerning the Status of Teachers* that covers primary and secondary school teachers. Some three decades later, UNESCO (1997) adopted the *Recommendation concerning the Status of Higher-Education Teaching Personnel*. The Recommendations are similar, and their application by national governments is overseen by a group of experts, the Joint ILO/UNESCO Committee of Experts on the Application of the Recommendations concerning Teaching Personnel (CEART). A publication covering both Recommendations is available with a Users' Guide (ILO, 2008).

An important contribution to the drafting of the 1966 Recommendations was made by William George Carr, the Executive Director of the US National Education Association (NEA), which was in the WCOTP at the time and is now an EI member organization. For the 1997 higher education recommendation, the lead was taken by Donald Savage, who was Executive Director of the Canadian Association of University Teachers (CAUT) working with other university associations and unions who all became members of EI.

The development of these two fundamental recommendations also demonstrates that EI is not just a relatively small secretariat under a General Secretary. It is also the leadership, talent and commitment of member organizations that make things happen at the global level. The two Recommendations do not cover early childhood education; however, their approach and contents influenced the development in 2013 of ILO Policy Guidelines on the promotion of decent work for early childhood education personnel. EI made an important contribution to the Guidelines and served on the group of experts that developed them.

In far too many countries, early childhood education (ECE) is considered to be childcare and educators are not able to acquire the necessary qualifications to enable them to fully contribute to the educational development of children prior to their entry into kindergarten and primary school. ECE teachers are disproportionately women and often have low wages and poor working conditions. EI and its member organizations have been using the ILO Guidelines to make the case to elevate the status of ECE educators. The Guidelines also help to argue that there should be public provision and regulation of ECE.

In the 1966 Recommendation (page 5), the rights and responsibilities of teachers are placed in the context of the mission and purpose of education. The first paragraph of the "Guiding Principles" in the Recommendations, based on the UN Covenant on Economic, Social, and Cultural Rights, reads.

Education from the earliest school years should be directed to the all-round development of the human personality and to the spiritual, moral, social, cultural and economic progress of the community, as well as to the inculcation of deep respect for human rights and fundamental freedoms; within the framework of these values the utmost importance should be attached to the contribution to be made by education to peace and to understanding, tolerance, and friendship among all nations and among racial or religious groups.

This broad definition of education, based on development of the purpose and meaning of education is the basis of the remaining provisions of the Recommendation that seek to ensure that teachers have the qualifications and latitude to help their students develop, not just to find their places in the job market, but also to live rewarding, rich lives, contribute to their communities, and be informed, responsible, and active citizens.

Education International, as part of its work since its inception, seeks education that delivers for "for the all-round development of the human personality" and society, and has resisted narrowing the scope of education to service to the economy. Focusing on narrow criteria for student success, excessive reliance on standardized tests, and constraining the role of teachers in responding to the needs of students and their communities, where that is the case, has diminished the role of education in building healthy and happy students and coherent and tolerant societies that accept diversity and build social peace.

EI promotes the two Recommendations with member organizations so that they can address professional issues with their governments based on global consensus recommendations. EI also does a regular survey of its member organizations on status issues which is submitted, with a separate set of views and recommendations to CEART at its meetings every three years. Examples of the survey are available from 2015 (EI, 2015), and also from 2018 and 2021. The most comprehensive EI submission to CEART, in addition to the surveys, was in 2015. It places modern issues in the context of the principles of the recommendations.

An example of something that emerged long after 1966 was the use of ICT and artificial intelligence in the classroom. However, the Recommendation states:

Since teachers are particularly qualified to judge the teaching aids and methods most suitable for their pupils, they should be given the essential role in the choice and adaptation of teaching material, the selection of textbooks, and the application of teaching methods, within the framework of approved programmes, and with the assistance of the educational authorities." It goes on to say, "Teachers and their organizations should participate in the development of new courses, textbooks, and teaching aid.

Global framework of professional teaching standards

In many countries, professional teaching standards have been adopted. They are often, but not always, developed with teacher organizations. In recent decades, there has been a tendency to judge performance of students and teachers in a way that limits rather than expands the impact of the teaching profession. Many of these “reforms” have been picked up at the international level. However, they are systems of quantification and standardization rather than professional standards.

Real and workable professional teaching standards need to reflect the experience and needs of the profession. The “standards light” approach has too often left teachers out of the picture. The teaching profession should play a leading role in the design and implementation of the policies and practices that will produce a school environment that is conducive to quality teaching and learning. EI took the initiative to create a global framework for such standards.

They were developed through a process of gathering information on national standards and practices and extensive consultations with member organizations. As part of that effort, a Unite for Quality Education and Leadership Conference was held in Rotterdam at the beginning of May of 2017 with representatives of member organizations and experts. This process led to drafting of standards with UNESCO. These standards, the Global Framework of Professional Teaching Standards (UNESCO, 2017) were agreed at the EI Eighth Congress in Bangkok in 2019. They have become the basis for discussion of national standards in many countries.

Given the growing internationalization of the discussions on the teaching profession, EI has emphasized many professional issues at the global level. An important focus on the profession has been annual International Summit on the Teaching Profession International Summit on the Teaching Profession (ISTP) held with the OECD since 2010 (Schliecher and Edwards, 2020). The International Summits, co-hosted by the OECD and EI, bring together Education Ministers with EI member organizations. ISTP meetings have changed the international dialog, have affected the work of the OECD, and have highlighted issues too long ignored, including the well-being of teachers and students.

In addition to generating an international discussion on the teaching profession, the process often enhances national social dialog. There are national discussions on issues considered by the summit and an attempt is made to reach a global consensus on priority issues. In some cases, this consultation process has helped to restore dialog between teacher unions and governments. A range of issues that have been explored at ISTP. Described below is the approach taken by EI, on various long-standing as well as some emerging issues.

Issues of educational policy and practice

Uses of technology

The question of the introduction of new technology and its positive and negative effects on the teaching profession and the status of teachers was already a concern before the pandemic, however, the widespread use of distance learning, especially in developed countries, accelerated due to the need to continue education to the greatest degree possible during lockdowns. However, consultation with teachers and their organizations on this question was exceptional.

The introduction and use of education technology or “edtech” have raised several issues relevant to teachers and their organizations. Among them are:

- The widespread exclusion of teachers and their organizations from discussions and decisions related to the use of learning technology and their effects on education, on students, and on the profession of teaching.
- The involvement, on a massive scale, of private corporations in the development and use of teaching materials and methods.
- The weakening of the responsibility of the State in the design and delivery of education services and, by extension, of the community and public governance.

The key to the introduction and use of new teaching technologies is participation of teachers through their organizations. For example, teachers are often concerned about excessive workload. Much of that burden is not directly related to teaching but is on administrative tasks. Technology might make it possible to reduce that burden. By shifting some administrative tasks to technology. Social dialog can help to determine where the use of new technologies can enhance the profession and where it diminishes it and the status of teachers and, therefore, undermines the quality of education.

There has already been bad experience with the development and use of IT-dependent teaching or measurement methods like standardized tests, most often developed by large corporations with little or no involvement of teacher organizations. That has also been true of assessment tools and other methods used nationally or internationally. These processes have contributed to de-professionalization. There is also a danger that new technology might be introduced as a way of reducing teaching and support staff even if it damages the quality of education. Again, the pandemic underlined the importance of social relationships in effective and good quality education.

The expanded participation of private firms, which may become a permanent feature of education, brings the danger that the vision of education as a market opportunity that has characterized school privatizations will extend to public schools, which will, in effect, become semi-privatized even if they remain, technically, public. As major source of profits of many of the high-tech companies come from the collection use and sale of data rather than from education services provided, there are important privacy issues as well. Research performed for EI has looked at edtech in primary and secondary education (Williamson and Hogan, 2020) as well as in higher education (Williamson and Hogan, 2021). That research was difficult not only because of the complexity

of the issues, but also because of lack of transparency, particularly on the private side. Understanding processes requires access to information, much of which takes the form of protected intellectual property.

Educational governance

Governance issues are relevant to the joint public-private role in education policy and delivery that comes with edtech (Edwards, 2021). One of the advantages of public schools is that transparent governance provides the possibility of public control of education and helps to ensure that it is rooted in the community. In democracies, making education a private as well as a public good, may put education beyond the reach of citizens.

Classic privatization remains an issue and there are still global companies trying to tap into public resources to make money by taking over the operation of schools. However, the edtech danger shows that there are also hidden forms of privatization or semi-privatization. Even if schools remain fully public, they may create competing schools with charter schemes tend to increase segregation. New Public Management, without necessarily any private investment, corrupts public education with market thinking and places distance between the practice of education and its mission. It may lead to segregation that public schools were intended to combat (Edwards, 2019a,b).

Shortage of teachers

The status of teachers is also a key factor in the shortage of teachers. Talented individuals may avoid careers in teaching because they see limited possibilities to develop as professionals and can be appreciated and better compensated in other lines of work. Far too many teachers are leaving the profession early, frustrated, stressed, and, in some cases “burned out”. There is also dissatisfaction due to inadequate training and preparation. A key factor in developing creative approaches to teaching and exploring pedagogy, but also substance is through initial teacher training, continuous, and in-service training. Improving teaching is also helped by good collaboration with other teachers. All these factors affect the attractiveness of the profession.

The EI 2018 survey report highlights the gross inadequacy of teacher training. EI member organizations reported that only 30% of respondents indicate that there is access to continuous professional development. They also reported that training was of poor quality and that teachers often had to pay for it and, in many cases, pursue training in their own time. This is an additional burden especially for teachers who are often underpaid and already have a heavy workload. The 2021 survey report confirms long-term concerns about continuing professional training in terms of quality, availability, and cost. The report states, “In too many cases, CPD was perceived to be of poor quality, not directly relevant to the issues that teachers were facing and came at personal financial cost without clear career benefits.”

In 2016, not long after the adoption of the sustainable development goals, UNESCO estimated that the world would need 69 million new teachers if it was to meet the SDG4 on education by 2030. The Organization of Economic Development and Cooperation (OECD) speaks of a “deep teacher-recruitment crisis”. A 2020 issue of OECD Observer says:

Education is the cornerstone of the knowledge-based society. But will quality teachers be available to provide it, or is the profession cracking under the strain of low salaries, an ageing workforce and demand for ever more complex teaching abilities?

If the teaching profession is to become attractive enough that young people want to join it and stay and so that experienced people do not leave early, major shifts in funding and support for teachers and their profession are required.

Teacher well being

In some countries, especially those employing “reforms” that include narrowing of subjects and promote evaluation based on simple factors like test scores have increased stress for teachers. However, they have also created a school environment that is less friendly to learning. Although most teachers are still satisfied with their profession and do not report debilitating stress to the OECD TALIS Survey (2018), they report that “acute stress at work is also strongly associated with teachers’ job satisfaction and their intention to continue teaching: 18% of teachers report experiencing a lot of stress in their work, and 49% report that having too much administrative work is one of the main sources of stress.”

Among EI member organizations, stress is reported especially from teachers in places that have pushed furthest with “reforms” including England, the US and Japan. The school is a community. It is a world of relationships among teachers, other school staff, administrators, students, and parents. Through those relationships, stress is easily transmitted. So is comfort and confidence. A school community functions best if it is stable healthy, and safe. School and education are part of life not preparation for life. The more that education is channeled into narrow paths that may be intended to serve the economy, but do not serve other human needs, the lower the quality will be and the less it will inspire young people and will, among other things, do a disservice to industry and the economy.

The future of the teaching profession

There has been a global discussion about the future of work in general. Much of it has been around the impact of technology on employment. It is a subject of interest for teachers and others in education because of the impact on teaching, but also because education will be a critical factor in adapting to changes in other sectors. EI has been working on the general challenge as well as on education specific issues. A resolution was adopted by the EI 8th World Congress in Bangkok, 2019 on the future of the Teaching profession (EI, 2019d). Based on that resolution, a Future of Work Reference Group was established composed of representatives of member organizations and experts.

The future, including the status of the teaching profession will depend on the direction that the evolution of education takes. It is a discussion leading to policy that is too important for teachers and their organizations to be excluded. They should play a role in shaping the choices related to the use of new technologies. However, the survey conducted for the reference group (Coldclough, 2020) showed a striking lack of consultation by education authorities. 45% of respondents said that they were not consulted at all and 29% said that they were only consulted “on a few aspects”.

The International Labor Organization established a Commission on the Future of Work. Its report called for a fundamentally different approach to technological and other changes. Rather than scrambling to adapt to whatever technological changes arrive, they called for a human-centered and long-term approach that takes advantage of a period of transition to try to design into the change process inclusion and social justice. EI welcomed the work of the Commission and its far-reaching recommendations (Edwards, 2019a,b). Given the speed of changes in the world of work, including in education, and the global nature of many of these changes, the efforts of EI and other Global Union Federations are the beginning of a much longer evolution. They will likely become a permanent, global trade union focus.

Inclusion, equity, human rights, and democracy

Although the situation varies by country, many have experienced a concentration of wealth and income. Even some countries that have made great progress against poverty are seeing unfair distribution. Some countries have growing numbers of “working poor”, often those in precarious and insecure work.

In its 2020 World Social Report published by UN Department of Economic and Social Affairs (DESA, 2020), it is reported that inequality is growing for over 70% of the world’s population. This is true in developed as well as developing countries. Inequality destabilizes societies, leading to despair and conflict, creating a climate of polarization and radicalization, and undermining democracy.

Equality and education

Education is part of the larger community and is affected by inequalities in society. Part of its mission is to help those who are disadvantaged in different ways. To the extent possible, inequities should be eliminated in systems of education. Economic inequality, by itself, may cause social, family, and individual problems, however, it is often compounded by other factors such as gender, ethnicity (especially for indigenous peoples), national origin, caste, religion, migrant, or refugee status (Edwards, 2020a,b), disability, or sexual orientation. In some cases, discrimination becomes more severe when there is a combination of characteristics (intersectionality). To help to address equity issues in education in a systematic and organized way, EI is working with member organizations on developing equity audits (EI, 2020) as tools to identify and remedy injustices.

Discrimination and exclusion are not new. However, they have been aggravated by politicians and extremist groups that generate hatred and disinformation. There are many examples from the past, some of which have led to violence and even genocide. These tendencies are often found in schools. At the same time, schools are among the rare places in the community where teaching materials and methods can reduce tensions and build understanding.

Gender

There has been work on how girls and women are viewed in curriculum. It is not just how they are treated in society, but how negative images may be perpetuated. In addition to dealing with equity issues in the context of education, EI addresses inclusion issues in systems of education. Often, women are heavily concentrated in early childhood education and primary schools and least present in higher education, research and TVET. EI has also promoted equity and inclusion in education trade unions. It has promoted greater women’s participation in trade union leadership. That includes through work in the World Women’s Conference and women’s networks.

Another priority for EI is the education of girls. In many countries, there has been a pattern of boys going to school and girls staying home to do chores or be child laborers. Or girls might be allowed to attend primary, but not secondary schools. Although there has been some progress in recent decades, every time there is an economic crisis, for example, with the impact of the pandemic on the economy, girls’ education suffers. SDG 4.5 commits to eliminating gender disparities in education by 2030. That is likely to be an unmet goal. Long and short term, changing the situation will require serious investment as well as further changes in attitudes.

Indigenous peoples

There are education issues like access and quality, but including indigenous history and culture in education as well as protection of the right of indigenous communities (and others) to have education in their own languages. Indigenous peoples not only report discrimination, but harassment and, in some cases, violence from surrounding communities and governments. There is an indigenous people's caucus at every Congress (EI, 2019a), which examines issues and makes recommendations.

The attitude toward indigenous peoples also reflects history that is often written about them, but without them. Such attitudes toward indigenous peoples or others are found in curriculum, teaching materials and approaches to issues. They perpetuate versions of history written by the most powerful. Corrective efforts are addressed in what is called, "decolonizing education" (EI, 2019b).

LGBTQ+

Another area where EI has played a pioneering role in the global trade union movement is on justice for LGBTQ+ people. It is more than just fighting discrimination, which in some countries is extreme and includes legal and police harassment and violence against LGBTQ+ people, especially teachers. EI and its regional organizations are working with member organizations to try to ensure that LGBTQ+ people feel welcome in their trade unions and in leadership and do not suffer from any forms of discrimination. There is an LGBTQ+ caucus (EI, 2019c) meeting held prior to each EI Congress.

Violence, harassment, and safe schools

EI has been preoccupied with violence and harassment in schools. Much of the focus has been on women and girls, which has been an especially serious problem. EI has issued a resolution on eliminating all forms of sexual harassment and Sexual Violence in Education Unions. However, over the years, the situation seems to have deteriorated. This reflects how common it has become, even though it is still under-reported. Efforts by EI have included an extensive program of training on School Based Gender Related Violence in cooperation with the United Nations Girls' Education Initiative (UNGEI).

However, it is also a problem for adults, including teachers and other education staff. That is one reason that EI, in cooperation with other Global Unions, campaigned for ILO Convention 190, which was adopted in 2019 and entered into force in 2021. C190, which applies to women and men, is a far-reaching Convention that has a reach beyond most ILO Conventions. It applies not only to employers, but to sub-contractors or others performing services as well as third parties, which might include, for example, customers in private companies or parents or other third parties in education.

The concept of "safe schools" is broad. It includes occupation of attacks on schools by military forces of governments or other armed forces. EI has been supporting government commitments to the Safe Schools Declaration (GCPEA, 2021) an intergovernmental political commitment to protect students, teachers, schools, and universities from the worst effects of armed conflict. Terrorists have attacked schools. Some have targeted teachers, especially women teachers. In some countries, especially the United States, schools have been attacked by armed individuals or groups, often using automatic weapons.

Quality education cannot take place in situations where students are afraid of being in schools or going to and from them. This applies to the danger of violence, but also harassment, including harassment or attacks on them because of what they are (e.g., LGBTQ+) or what they say. The school community should be a safe place to learn, discuss, and disagree without danger, fear, or stress. In some cases, it can serve as a safe place for students who are subject to dangers at home or in their neighborhoods.

The human rights of children are elaborated in the UN Convention on the Rights of the Child adopted in 1989 (UN, 1989) and entering into force in 1990. It mentions education, but also a wide range of other rights that are relevant to educators and education systems. Unfortunately, the Convention is often violated as children are too often subject to abuse of their fundamental rights. EI has explored ways of preventing such violation.

Child labor

Child labor was the scourge of the industrial revolution in the 19th century. One of the earliest targets of social legislation and of the early trade unions, was the banning of child labor. The ILO adopted Convention 138—Minimum Age Convention, 1973 (No. 138) as well as C182—Worst Forms of Child Labor Convention, 1999 (No. 182). However, child labor remains a serious problem. The ILO estimates that 160 million children were victims of child labor in 2020. EI has been involved in the global fight against child labor including, for example, through joining with Nobel Peace Prize winner Kailash Satyarthi in his efforts to call attention to child labor and eliminate it as well as cooperating with the ILO. EI has concentrated on the impact of child labor on education and has worked with its member organizations to get children out of the workplace and in schools. Unfortunately, progress quickly erodes in times of economic crisis as parents take their children out of school so that they can help support the family. Such a setback was experienced during the COVID-19 pandemic.

EI operates child labor programs with member organizations in Africa, Asia, Europe, and Latin America. The emphasis has been on getting children into school, creating child labor free zones, and implicating teachers, parents, and communities in the effort to ensure that children have a future through education rather than being exploited as workers and denied the possibility to develop. The success of the efforts has depended on trade unions working with and training teachers to persuade parents to put their children into school as well as working with other groups in communities.

Academic freedom

Academic freedom is, at the same time, a professional, a human right, and a democracy issue. In higher education, the professional right is, in effect, weakened by the growth in precarious work for teachers and researchers and by a weakening of systems of governance involving teaching personnel, which, in some cases, may also be related to hesitation to express one's views. Being assertive on academic freedom issues may mean that contracts are not renewed. In other words, employment security with decent conditions, collegiality, good governance, and academic freedom are all linked.

In many countries, there has been an alarming reduction in public funding for independent research. That can make universities dependent on private funds where private parties will determine what is researched. That can mean that universities and research institutions are not able to provide sufficient, independent research to help inform political discussion and decisions on public policy.

A combination of these factors may help to explain why the Academic Freedom Index (EI, 2021b) shows significant slippage in the respect for academic freedom in recent years. Examples of problems with academic freedom on all Continents were presented in a virtual conference in 2021. Academic freedom is a concern in lower grades, in secondary and primary schools. As teachers are examining issues that are relevant to public debate, many governments prefer indoctrination to education. However, the danger is not limited to governments. It can also come from active groups in the community, often extreme, that seek to control the content of teaching right down to the words used by teachers in the classroom.

Political issues may even include the communication of scientific facts. The teaching of evolution is still banned in some countries. Similarly, climate change deniers, sometimes with the backing of fossil fuel companies, may put pressure on schools and on politicians responsible for education to alter the facts or to present a "balanced" picture where both facts and alternative facts are taught. EI has long been worked on climate change issues. It is engaged in a major effort to ensure that teaching climate change (EI, 2021a) is part of school curriculum and that teachers are free and trained to teach the issues. However, it is more than building understanding of the issues. It is also encouraging young people to become active citizens, to organize and participate in the debate so as to influence government decisions.

Trade union rights and democracy

Teachers are often the victims of violation of their trade union rights. This may take the form of assassinations, imprisonment, torture, or they may be denied their rights in situations where fear is systematically organized. In many countries, they do not have the right to form independent trade unions, often due to larger bans on organizing by public employees. Even where they have the right to organize, they may be denied the right to collective bargaining or may be subjected to limits on the subjects that can be negotiated, referred to as the "scope of bargaining".

Teachers are targets for attacks. Just as with journalists, it is not only related to their trade union activity, but also the sensitivity of their profession for governments. Both journalists and teachers have a public role. Many governments would prefer to have teachers function as agents for their political agendas rather than as educators. Another reason may be that teacher unions, where they are allowed to exist, are often among the largest unions in a country and have members in both urban and rural areas. In many countries, they are also respected members of the community and considered to be leaders. Defending the rights of teachers and other education staff to bargain is a central priority of EI. That defense is not only in the form of support in the country, but also mobilizing support among member organizations, including in the form of urgent action appeals and solidarity appeals on the internet, and using international complaint procedures.

The most effective international organization for the defense of trade union rights is the International Labor Organization (ILO). It has adopted the crucial conventions on trade union rights, including C87 Freedom of Association and Protection, 1948, C98 Right to Organize and Collective Bargaining Convention 1940 and C151 Labor Relations (Public Service) Convention 1978. If the rights under these conventions are not protected by governments, regardless of whether they have been ratified, complaints can be made by EI to the Committee of Freedom of Association (International Labor Organization, n.d.). In addition, complaints on ratified conventions can be made to the on the Committee of Experts on the application of Application of Conventions and Recommendations. A selection is made of decisions by the Experts to be reviewed by the Committee on the Application of Standards (CAS) of the International Labor Conference. At the meeting of that committee, governments cited by the Experts are summoned to appear and questioned on their conduct. It is the only place in the world where governments are called upon to publicly respond to allegations of violation of those fundamental human rights.

Education, trade unions, and democracy

Human rights, including trade union rights, cannot be effectively protected in the absence of democracy. The struggle between totalitarianism and authoritarianism on the one hand and democracy on the other defined much of the history of the 20th century. The fall of fascism and of Communism in the Soviet bloc generated a wave of democracy on all continents. Trade unions and education are among the bulwarks of democracy. In the first decades of the 21st century, disturbing signs emerged of the weakening of democracy even in some long-standing, stable democracies. As trade unions, and collective bargaining weakened in most countries, democracy suffered.

In addition to being democratic forces, trade unions are democracies inside democracies that help deepen it beyond free elections. As, the focus of education in many countries, turned to test scores and other measurable achievements, there was less attention devoted to building the competencies of democracy of young people. Principal among those competencies is critical thinking, the ability to discuss and argue, and active citizenship.

These problems were aggravated by the development of social networks combined with the weakening of the media, especially ethical media. These networks enabled disinformation as well as hate and bigotry to be instantly transmitted around the world. They fueled polarization and radicalization where opponents became enemies. This massive disinformation, in some cases, led to violence. That added another necessary skill. People needed to be equipped to navigate the tsunami of information, develop the ability to be skeptical and to filter out, to the extent possible, lies and distortions.

The concern about the erosion of democracy among education trade unions led to a major discussion of democracy at the 8th World Congress of EI, held in Bangkok in July of 2019. EI published a book, "Education and Democracy: 25 Lessons from the Teaching Profession" (Hopgood and van Leeuwen, 2019) that was launched at the Congress and introduced by EI General Secretary Emeritus Fred van Leeuwen (2019) who stressed in his remarks that education systems have an important responsibility to protect and promote democracy. The book was available in English, French, and Spanish and has, subsequently been translated into Polish, German, Czech, Russian, and Dutch. It is without copyright and can be used, in part or in its entirety, in classrooms and in internal and public discussions.

In addition to trying to help stabilize democracies where they have been historically strong, trade unions are often in the front lines of fights where dictatorships have emerged or consolidated and space for democratic organization may be limited. The fight for democracy, for education and trade unionism is one fight. As expressed by David Edwards on the International Day for Democracy, "the fight for democracy is a war of ideas and we, as educators and trade unionists are on the front lines of that war. The time for complacency, if there ever was one, is over".

The pandemic, education, and the social contract

COVID-19 has killed people, devastated families, and created panic and desperation. It has also produced or deepened other crises. Responses have gone from generosity and assertion of community and caring on the one hand to meanness, bigotry, and violence on the other. The pandemic has also shown that global problems need global solutions but, at the same time, it has been used to promote nationalist populism. The conflict of these conflicting visions is global. Part of the job of EI is to ensure that issues and challenges that are global receive global as well as national responses.

Given the contrasting lessons of the pandemic, there is a stark choice to make to shape the direction of the future. Will it be a future of isolated screen-bound individuals, or will it be social beings embracing community, cooperation, and collective action? Will people be trapped in nationalism and fear of the unknown or will they reach out to, engage with, and learn from others? Will it be solidarity or selfishness?

Trade unions are collective. In fact, all democracies, by their very nature, are collective. It is in that secure environment that individual rights and diversity can flourish. Atomization can never effect change. For society to progress it must, first, exist. Schools are a microcosm of the community. Some of the lessons of shutdowns and remote learning may apply to larger society. Children, away from school, were lonely. Mental illness and suicides went up. Violence in homes flared, and the development of healthy personalities was retarded.

When children returned to school, in most cases, laughter came back as did the joy of learning. People have re-discovered that social relationships facilitate learning and development. The social contract is the context for the opportunity to change the way we live and make societies and schools more human centered. Children can be helped to become active citizens rather than just passive consumers. A social contract is about human beings not things. Education is such a contract which engages students, teachers, parents, and the community. It is built around common values. That is the point of reference from which "reforms" and changes in social relationships and teaching methods should be judged.

UNESCO, in its 2021 Futures of Education report, explains, "A social contract is 'an implicit agreement among members of a society to cooperate for shared benefit. A social contract is more than a transaction as it reflects norms, commitments and principles that are formally legislated as well as culturally embedded. The starting point is a shared vision of the public purposes of education'" (UNESCO, 2021: 2).

Education International is working to fundamentally change the philosophical environment of education so that it responds better to the aspirations of young people, the needs of society, and the common good. That means not only re-examining the learning environment that is created, but also the contribution made by education to social justice, integration, and tolerance. It may contribute to the economy, but it should also make it easier for people to live happy, full lives and to build solid, resilient, and sustainable democracies with social cohesion.

It also means rejecting so-called reforms of recent decades that have damaged the quality of education and the lives of students and teachers and restoring the joy of learning. The social body of schools has rejected the forced transplant of market dogma into school management and the competition and extreme individualism that comes with it. American writer Henry David Thoreau wrote, "the mass of men lead lives of quiet desperation". That does not have to be the case. Children should not leave school, as too many do, with feelings of fear and panic, beaten down when they should be spreading their wings. It should be recognized that school is part of life and not a boot camp to prepare for life. An education social contract can help young people lead whole, satisfying lives of joyful aspirations where hope vanquishes fear and where success is not judged by the vastness of one's investment portfolio, but by the reach of one's heart.

Prevalent liberal and conservative perspectives on global philanthropy in education presume that philanthropy operates in a largely charitable fashion that aims to expand educational access, inclusion, and opportunities for education to be an engine of economic mobility and national economic expansion. In these views, corporate and non-profit foundations, non-governmental organizations, state-sponsored organizations, and supra-national organizations may differ in their approaches and strategies but share a largely beneficent intent framed as universally beneficial to recipients. A less widely held critical perspective on global philanthropy focuses on how philanthropy, despite often being well-intentioned, tends to represent and promote the interests of ruling classes and dominant cultural groups that are in a position to fund, establish, and set the agendas of philanthropic foundations. In the critical perspective philanthropic projects and trends need to be understood as adjuncts to and instruments of global capital accumulation strategies and cultural ideological efforts that seeks to produce knowledge, ideology, organizational forms, and common sense in ways that naturalize and celebrate the social dominance of a small number of people over the mass of humanity. The dominant views presume an ameliorative role of philanthropy that mitigates the exceptional instances of individuals and groups who fail to succeed in an otherwise functional and potentially fully inclusive and beneficial global order. This global order is presumed by philanthropists to be ideally composed of capitalist economy paired with liberal democratic political arrangement. Philanthropic efforts often position education as the means for inclusion into such an arrangement despite the fact that such an arrangement appears incapable of keeping half the world in poverty and the other half sickened by maladies of excessive consumption.

Globally, education is positioned as a solution to non-educational public problems such as class inequality. Global education philanthropy appears largely incapable of providing the means to avert the catastrophic specters of dire public problems: global warming, the increasing risk of nuclear catastrophe, record levels of economic inequality and wealth concentration, rising authoritarianism and anti-democratic culture. Indeed, some of the largest educational philanthropy trends of the past two decades have aggressively promoted educational reforms that undermine the capacity of education to foster democracy, equality, civic life, collective agency, and public good. Global philanthropists in education work to concentrate governance and control over schools, knowledge, teaching, and curriculum in the hands of elites while undermining knowledge and learning as a means for people to comprehend and intervene against these enormous public problems. Instead global philanthropies have largely furthered the four decade neoliberal trend of treating education an investment opportunity through various forms of privatization and commercialism while fostering an ideological project that emphasizes standardization and homogenization of knowledge, depoliticization of education, the framing of knowledge as a deliverable commodity, and the reduction of schooling to its market uses (Saltman, 2010). Both the profit drive and ideological projects of global philanthropy have increasingly blurred the lines between non-profit giving and for profit business positioning business itself as philanthropy. Most recently philanthropy is playing an outsized role in education fostering digital capitalism, data extraction and commerce, and the intertwined project of “impact investing” and “innovative finance.”

In what follows here I provide an overview of how philanthropy in education has shifted over time to further the interests of a transnational capitalist class whose interests have been globalized. According to recent studies of global philanthropy the bulk of current global philanthropy has developed in the past 25 years, is focused on education, is financially dominated by US foundations, and these foundations are predominantly grant-giving as opposed to running in house programs (Fischer, 2018). According to UBS's Global Philanthropy Report done by Harvard researchers the key factors driving the expansion of philanthropy are: “global economic growth and the enormous increase in private wealth accumulation; persistent economic and social inequalities; and governmental and private efforts to encourage and support philanthropic institutions and giving” (Fischer, 2018). Academic, finance sector, and popular press accounts of global philanthropic growth tend not to recognize that there is a causality between worsening economic inequality and the upward concentration of wealth and the capacity for philanthropy. In other words, in order for philanthropists to give they must first take. The public, especially in the US, forgoes public money in taxes to financially support private foundations. Moreover, what capitalists who become philanthropists take is the uncompensated labor of workers as represented in the stagnation of real wages. Such a dynamic was evident during the heyday of the industrial economy as the captains of industry violently broke strikes to keep workers from organizing for higher pay, benefits, and shorter hours. These same bosses such as Andrew Carnegie led the creation of what is known as “scientific philanthropy.” According to Carnegie in *The Gospel of Wealth* the

crucial aims of such early philanthropy were to fund and support public sector knowledge making institutions such as libraries and universities in order to bolster meritocratic ideologies and also undermine support for radical movements such as socialism that would have redistributed control over capital from owners to workers. Despite these conservatizing tendencies of traditional philanthropy, they nonetheless represented an investment in and commitment to public knowledge-making institutions and were guided by a commitment to a collective sense of the public. They also largely provided funding to local institutions while allowing those involved in the public institutions to govern and administer the use of the funds. Public knowledge-making institutions such as schools, libraries, and museums are subject to contestation and struggle by classes and cultural groups vying for social hegemony. These aspects differed from the next major phase of philanthropy.

Venture philanthropy

In the early 1990s a new form of philanthropy called Venture Philanthropy began in Silicon Valley and was initially involved in democratic party politics. Modeled on venture capital and the finance sector, venture philanthropy radically recast the model of philanthropy and its purposes. Venture philanthropy posed philanthropy as if it is a business investment and sought to maximize “return on investment.” Though venture philanthropies are non-profit organizations and mostly seek to influence public institutions such as public schools they embrace a private sector framing and set of assumptions. Grant recipients ought to be forced to compete for scarce funding and should make system reforms along the lines favored by venture philanthropists. These reforms were decidedly neoliberal privatization- and deregulation- oriented reforms. For example, The big three venture philanthropies Gates Foundation, Walton Foundation, and Broad Foundation each sought to promote educational privatization with different emphases. Gates aggressively pushed charter school expansion of publicly funded yet privately managed schools and also led the standardization and homogenization of curriculum through the Common Core State Standards. Walton played an outsized role in promoting school vouchers for parents to opt out of public schooling and use public money to consume private schools. Broad promoted and developed the privatization and corporatization of educational leadership among other projects. These and other venture philanthropists “leveraged” their foundation money to influence states, districts, and schools to compete against each other for money by embracing market-based reforms. On the model of investment capital the “successful” school models would be “scaled up” while public schools would be allegedly forced to compete against privatized schools. Even though the total amount of money going from foundations to schools was small relative to total spending on public education, the influence was enormous as cash strapped schools and districts competed to out-comply with the venture philanthropists’ mandates such as lifting the caps on allowable charters in a district. The venture philanthropy model became integrated into the US Department of Education under the Obama administration with figures from the Gates Foundation setting up competitions to embrace privatization under the promise of getting scarce federal money.

Venture philanthropy was significant for shifting governance over public education away from the public and into the hands of the billionaire donors who established the foundations. It was also significant for influencing the public to accept a reframing of public education as being less about collective responsibility for all students and families and more a private consumable commodity for individual families to game in order to compete for shrinking access to jobs and future economic opportunity. While venture philanthropists spent billions of dollars on these projects, in traditional measures of test-based performance, vouchers performed poorly and charters did no better and sometimes worse than traditional public schools. Nonetheless, these reforms continue despite a lack of such empirical evidence for their success. Market ideology has been the driving force for these reforms. Many of these reforms have done measurable damage to public education. For example, in the US charter school expansion resulted in exacerbated racial segregation, push outs and exclusion of students in need of special education and language services. Gates and Zuckerberg have funded Bridge International Academies, a for profit educational management organization in India, Kenya, Uganda, Liberia, and Nigeria that has been criticized for human rights abuses.

... the United Nations, the African Commission on Human and Peoples’ Rights and the UK parliament’s International Development Committee have raised concerns about the quality of BIA’s educational programme, its relationship with governments, its compliance with government regulations, and relatively high cost of fees.

Doward (2020).

As well, the neoliberal education restructuring promoted by venture philanthropists bolstered excessive testing and anti-intellectual and anti-critical forms of teaching and approaches to curriculum, and expanded repression especially targeting working class and poor students and non-White students. Knowledge and learning within the logic of these reforms was framed not as a means of understanding and collectively governing the world but rather as a means of accumulating decontextualized knowledge that could be exchanged for education promotion to be then exchanged for economic opportunity. Though the standardization, homogenization, anti-intellectual approaches to teaching and learning were positioned by venture philanthropists as apolitical, neutral, and universally-beneficial they represented the particular interests and perspectives beneficial to donors. An important consequence of the privatizations promoted by venture philanthropy has been that they close down public space as contested terrain. As public schools become privately managed and owned public struggles over governance, curriculum, and pedagogy become foreclosed.

Philanthrocapitalism

As the influence and impact of venture philanthropy peaked around 2010 contemporary educational philanthropy took a slightly different direction. The Chan Zuckerberg Initiative, Omidyar Network, and Emerson Collective established Limited Liability Companies comprised of both for profit businesses and non-profit businesses and called them educational philanthropies. Philanthrocapitalist LLCs such as CZI and Emerson invest in for profit education companies particularly in the technology sector. Both have invested in adaptive learning technologies. The legal structure of an LLC allows the company to evade scrutiny the way non-profits cannot. The movement of money and financial data can be kept secret by these organizations thereby keeping the public from knowing what these businesses are doing and how activities deemed “philanthropic” are actually profit seeking and at odds with any stated mission. If venture philanthropists hijacked public governance by allowing super-rich individuals and corporations to take governance control over educational priorities and public resources to foster a radical neoliberal agenda, philanthrocapitalism takes this a step further. Philanthrocapitalists also hijack public governance but do so while engaging in direct school commercialism and privatization activities. They own and direct education businesses that seek to contract with public schools, districts, and governments and thereby capture public dollars and obscure how much money gets directed from educational resources and processes and skimmed out as business and investor profit under the guise of charity.

Global philanthropy in education needs to be understood as part of what has been termed the Global Education Reform Movement. This movement comprised of supra national organizations, corporate foundations, philanthropies, consultancies, think tanks, and for-profit businesses promotes the market-based restructuring of education around the world. The aim is to transform public education as a public good into a private consumable service. The agenda has also centrally been about promoting a vision for public education dominated by corporate culture and business uses for education. In rich countries the privatization agenda has for decades focused on promoting vouchers, charters, “neo-voucher” scholarship tax credits, and the standards and accountability movement that revives industrial efficiency models of schooling. In poor countries the agenda has been to avert the development of public schooling and instead support privatized directions for education typified in the push by the World Bank for pay for fee education rather than free universal public education.

In the past decade two global trends have been integral to the directions of global educational philanthropy: impact investing and other so-called innovative finance schemes and the vast expansion of digital educational products and services. One of the most significant impact investing schemes is known as Social Impact Bonds or Pay for Performance. The Rockefeller Foundation is among the largest global players in Social Impact Bonds. These arrangements, facilitated by philanthropies, bring together public sector actors such as states or cities with large investment banks. They finance educational and other social service projects vastly inflating the costs of the service for the public entity on the premise that if metrics show ineffective performance the public entity will not have to pay. These arrangements are framed by proponents as promoting accountability and cost savings. However, evidence suggests that the programs selected and involvement of vested interests assure that programs are nearly always paid out to investors (Saltman, 2018). Sometimes investment banks like Goldman Sachs can double their money at public expense as they did with an early childhood program in Chicago (Saltman, 2018).

Digital directions of global education philanthropy

Impact investing in which for profit investing is muddled with philanthropy has become increasingly interwoven with the expansion of digital forms of educational commercialism. The expansion of the Social and Emotional Learning trend in education is a case in point. Social Emotional Learning has expanded ostensibly to counter excessive testing and the dehumanizing tendencies of the standards and accountability movement that was promoted in large part by venture philanthropist Bill and Melinda Gates Foundation.

Globally, educational privatization is expanding in new directions characterized by the trade in data and digital technologies, the making of students and teachers into data engines, and the use of data and digital technologies to expand impact investment schemes (Williamson and Piattoeva, 2018; Saltman and Means, 2019). The quantification of so-called academic achievement in the form of standardized testing has long been big business benefitting particularly test and textbook companies (Strauss, 2015). Education and technology sectors have been converging as test and textbook publishing education companies like Houghton-Mifflin, ETS, Pearson, and Kaplan have increasingly become technology companies, and technology companies have increasingly become education companies (Saltman, 2016). However, the quantification and datafication of affect, student behavior, learned dispositions particularly for self-control, and so-called “soft-skills” under the rubric of Social Emotional Learning (SEL) are at the center of the new forms of technology-oriented privatization on a global scale (World Economic Forum, 2020; Williamson and Piattoeva, 2018). Such social quantification projects in SEL employ artificial intelligence education technologies such as adaptive learning technologies, biometric pedagogy devices like real-time webcam systems, video games, and avatars. The increasing turn to harnessing the daily activities of students, teachers, and administrators as data manufacturers via technology and the financial securitization of this data builds on longstanding dominant trends of profit seeking in education. That is, such technologies displace the labor costs of teachers and allow corporations to capture public education tax dollars by replacing the work and meaning making activities of teachers with corporate technology in the form of contracting (Barshay, 2019, p. 6). The trade in and devising of impact investment financial instruments based in student data-making represents a new major source of school profit seeking (Barshay, 2019). Many venture philanthropy players like the New Schools Venture Fund have shifted into the convergence of digital commerce and resilience discourse. For example, New Schools Venture Fund which was a promoter

of charter schools is now financing tech start ups that sell social emotional learning programs like the for profit companies Class Dojo, Centervention, and Amira.

This steady expansion of digital profiteering in public schooling needs to be understood not merely as a consequence of new technologies but rather as part of a broader class-based global project for hegemonic control by the transnational capitalist class (Robinson, 2018, pp. 11-29). As William I. Robinson argues, crises of capital overaccumulation and state legitimacy have resulted in strategies for “militarized accumulation” to expand markets into hitherto uncolonized places including the lifeworld and subjectivity (Robinson, 2018, pp. 11-12). So called innovative finance schemes have long been a means to justify this agenda by shifting the discussion of public goods and services into the language and logic of business and markets. Within this logic public schools have been declared failures that need to “go out of business” while schemes for competition, choice, and turnarounds have been pushed by philanthropies as the solution.

The recent rapid growth of two major new forms of educational privatization are in fact converging: (1) impact investing schemes that promote privatization of education such as venture philanthropy and social impact bonds, and (2) data producing educational technologies. The specific form of digital capitalist pillage of the lifeworld takes shape as what Couldry and Meijas refer to as the industries of social quantification (Couldry and Meijas, 2019). These two forms of privatization are coming together in part through the quantification of affect and behavior particularly through the discourses of resilience, Social Emotional Learning, and play based learning that are being promoted by supra-national organizations, corporations, investors, and philanthropic foundations. Resilience is a class based ideology that suggests that poverty and inequality cause stress and trauma in poor students. The solution in the discourse of resilience is not to end poverty and inequality by for example redistributing control and ownership of capital from the 0.1% to everyone. Rather the solution is to give individual coping strategies for students to develop character traits such as persistence or grit and tools for emotional self-management. There is a big business in resilience and impact investment “philanthropies” such as New Schools Venture Fund form a support structure enabling commercialism, resource-skimming, and the roll out of the resilience ideology. The activities of one such philanthropic foundation, The Lego Foundation, typifies the turn to quantifying student behavior, affect, and educational activity in order to create commercial opportunities for corporations under the aegis of care and charity.

The Lego Foundation

The Lego Foundation and the Real Play Coalition, of which it is a part, have been working with the World Economic Forum (WEF) and the Organization of Economic Cooperation and Development (OECD) to support the expansion of the measurement, quantification, and assessment of play. The Lego Group, headquartered in Denmark, is the largest toy company in the world earning about \$2 billion a year through sales of its plastic interlocking blocks but also its Legoland theme parks, series of highly lucrative Hollywood movies, and other increasingly digital merchandise. The Lego Foundation, a not for profit philanthropic organization, funded by the company, plays a prominent role in promoting play based learning internationally, promoting the idea of an international educational skills crisis that ought to be met with play based learning, and encouraging the measurement and assessment of play and the inclusion of such assessment in the OECD Pisa international educational comparison tests and the linkage of quantified play to the Millennium Development Goals promoted by the World Bank (Parker et al.). Lego Foundation produces a body of literature framing play based learning as fostering a specific brand of creativity that is defined by school to work skills aligned with the broader instrumental discourses of Career and Technical Education and STEM. Though it employs a number of seemingly progressive pedagogical terms the pedagogy delinks student learning and experience from the broader social structures, forces, and antagonisms that make learning situations meaningful and it defines agency through immediate problem solving skills and against self and social interpretation that could form the basis for social intervention. The approach is similar to that of other resilience pedagogies ranging from Grit to meditation programs that aim to foster in students a focus on subjective experience delinked from the objective conditions that produce subject positions and the culture within which these pedagogies become meaningful.

The quantification of play for the Lego group at the very least then has two important dimensions. One the one hand by inserting play into the global accountability and standards movement spearheaded by supra-national organizations OECD and WEF that represent multi-national capital, Lego aims to position their business and their products as essential to educational provision if not renewal, human development, economic growth through human capital, and individual skills that contribute to that economic growth.¹ By promoting play as quantifiable, measurable, and integral to global educational comparisons, Lego stands to legitimate itself and its profit seeking activities in these regards while increasing the likelihood of greater revenue. If quantified play can be successfully integrated into global comparative educational accountability standards, then play will be measured along with other academic achievement on national tests that form the basis for international comparisons. There are rewards and punishments for nation-states for complying with or failing to comply with OECD/WB mandates for education. Nationally, efforts will be made to increase test scores by focusing on the skills and dispositions that will be measured. Having successfully lobbied for the incorporation of play based learning as a measurable skill, Lego will be ready to provide the curriculum materials in the form of Lego products. The Lego Foundation is spending a lot of money and working with a lot of other organizations to accomplish this legitimization project: Project Zero at Harvard University, collaborations with OECD, WEF, and the Real Play Coalition to name a few of the most

¹The Lego Foundation's reports and advocacy materials make these aims explicit and the OECD's reports include the play based learning agenda as part of its neoliberal human capital development perspective.

significant. Secondly, the agenda for the quantification of play creates the conditions for the increasing convergence of education and media entertainment corporations around digital learning products. This convergence of education and digital media entertainment naturalizes as necessary for learning and human development gamified forms of pedagogy typified in digital Social Emotional Learning apps, biometric measurement systems, personalized learning products, and the interface of physical toys like Legos and drones with digital apps. As well, this convergence creates the conditions for the ever-greater digital measurement and surveillance of children's activity and human activity, the normalization and "making innocent" of total surveillance and commercialization of that surveillance through the discourse of childhood innocence.² Such digital surveillance and commercialism includes children's use of screens on various devices, webcams but also the use of biometric tracking devices that are now being put on children in some schools throughout the day. The social control and commercial extraction/digital representation possibilities of datafication are part of a broader trend toward the "Internet of Things" IOT aiming to integrate the physical world with digital industry (Alexander, 2018; Dyer-Witthford et al., 2019). The Covid 19 pandemic both accelerated the trends toward digital educational commerce and brought to the fore contests over the longstanding agendas of some philanthropies.

Conclusion: need to shift philanthropy into the domain of the public

In nations that give tax subsidies to philanthropy what ought to be recognized is that rather than generosity and charity these subsidies to the rich need to be seen as give-aways of public governance and public resources that could allow for greater citizen control over education and allow for money that is needed to support historically underfunded schools. As well, the ideological tendencies of most philanthropy need to be scrutinized for the key questions: Whose purposes for education are being promoted? Whose knowledge and curriculum is being promoted through these endeavors? The most charitable act philanthropists could do would be to work to change the systems that amass wealth and exacerbate inequality, and spread inequality and immiseration—that is, the very mechanism that allow philanthropists to be philanthropists in the first place.

When, how and why did for-profit corporations get involved in the field of education?

Since the 19th century, corporate actors have been involved in the “reforms” of primary and secondary education worldwide (Arno, 1980; Carnoy, 1975; Cuban, 2004; Hall, 2008; Lagemann, 1992; Molnar, 1996; Shipps, 2006; Watkins, 2001). The role and reach of corporate actors in education has evolved dynamically with social and historical (geopolitical context) (Au and Ferrare, 2015; Fabricant and Fine, 2015; Lipman, 2011).

By for-profit education corporation (fpec), we mean, following Moeller (2020), “actors, processes, networks, styles, and power relations related to businesses or the for-profit sector” as well as rulemaking and legislation related to the for-profit sector. Moeller (2020) includes in this definition the following types of organizational actors: corporations (Burch and Good, 2014; Koyama, 2010; Robertson et al., 2002); corporate foundations (Moeller, 2018; Schwittay, 2006); private foundations (Reckhow and Synder, 2014; Scott, 2009; Tarlau and Moeller, 2020; Tompkins-Stange, 2016); nongovernmental organizations (NGOs) (Kamat, 2004); religious organizations, think tanks, and lobbying groups (Anderson and Donchik, 2016); parent associations (Posey-Maddox, 2016); and global and national forums (Ball, 2012). We extend this definition to include state/government actors, at the national, regional, subregional and local level whose activities incentivize (via rewards and sanctions) corporate activity.

Globally, the types of reforms in which corporate actors have participated fall into the following main categories: charter schools, school vouchers, educational tax credits, philanthropy, for-profit schools, public-private partnerships, and education reform. These and other reform activities can be further differentiated as market or quasi-market reforms (Whitty, 1997). In quasi market education reforms, education might be publicly financed, with the government or state contracting with private agencies for service delivery as is the case of charter schools. Alternately, we also see for-profit corporate activity in reforms which shifts funding and control of schools to for-profit corporations. For-profit corporate actors can incentivize families to exit the public system through home schooling and/or the establishment and creation of new types of schools, through activities such as school vouchers and charter schools (Gunter et al., 2017; Levin, forthcoming). Reforms that involve corporate actors sit at the nexus of a fundamental tension in education: the public and private purposes of education (Levin, 1987). The public purpose is to prepare students to participate in democratic practices that protect freedoms. The private purpose concerns the rights of families to decide how their children are educated and the ideas to which they are exposed. Political and social crises (such as the pandemic) create opportunities for policy entrepreneurs to capitalize on the tensions between public and private goals of education for commercial or political gain, examples of which are discussed below.

It is important to note that the political systems and policies in place at the nation-state level, can influence corporate reform activities and expansion, but do not determine the presence or absence of activity even by law. One contemporary example of the former concerns recent actions by Chinese government to regulate the creation and operation of on-line after school tutoring companies under the publicly stated principle of reducing educational inequalities. The companies, with revenues in billions of dollars, were criticized by the Chinese government as widening income inequalities between well to do Chinese families with the income to purchase after school tutoring (and expected educational advantages) for their children and lower income families who lacked the means to do so. Government policies at least for the short term have generated substantive changes in the composition of the tutoring marketplace (in China and globally).

The involvement of corporate actors in education reform tends to result from one of the following privatizing trends a shift in the activities from public to private, including deregulation and globalization, and/or a shift in the production of goods and services from the public to private sector (Starr, 1988). These shifts may be the result of intentional government action, changes in the demands/purchasing behavior of individuals and organizations that may or may not be linked to government action. In either case, the shifts are always interdependent with broader trends in the institutional environment of education reform which can be understood as linked to broader ideological and geopolitical debates and enduring conflicts over the purposes of education. Locating the drivers of corporate activity in education requires moving beyond the basic binary of government and market and traditional conceptions of societal functions. As noted above, government actors are corporate actors with the investment capital to create entirely new markets in education from which both financial and political benefits flow back to governments. For profit

corporate entities that identify legally as corporations are political and government actors whose rule-making (particularly in the case of multi-national companies or companies that dominate regional/national markets) set policy for public access to services.

How is the role of FPCs in education being interpreted in education research?

There has been much good work synthesizing the nature and types of impacts of for-profit corporate activity based on the literature (c.f. Moeller, 2020; Verger, 2020). One research stream has focused on corporate actors as extensions of broader market logics in education and the effects of these market logics on educational policy and practice. This research has concluded that corporations act as carriers of corporate style reform which are modeled on the logics of efficiency and accountability (c.f. Burch, 2009; Molnar, 1996; Shipps, 2006). Through their influence, corporate actors shape policy and practice, conceptions of teachers' work, what counts as reform among other issues (Ball and Youdell, 2007; Ball, 2012; Lipman, 2004). From this work, we learn that while corporate activities move "globally," they manifest locally and are historically situated (Burch, 2021; Burch and Miglani, 2017; Miglani and Burch, 2021; Engel, 2008; Engel and Frizzell, 2015; Maxwell et al., 2020). And in this regard, the influence of corporate education actors is contingent on local action. Local actors—individual and organizational—rarely adopt reforms whole cloth. The impacts of for-profit corporate entities are mediated locally, as reforms are partially adopted and transformed, ignored or in other ways and at other times resisted and/or rejected (Burch and Good, 2014; Lipman, 2004; Münch, 2020).

A second stream of research has focused on whether and how the influence of these corporations has been "better" more effective/efficient in terms of student outcomes relative to public (non-corporate provision of services). This research has concluded that public models of service delivery as compared to private models tend to be different in terms of policy goals but both tend to be informed by costs. For-profit organizations seeking to make a profit may try to operate schools or make and administer tests inexpensively so they can make a profit. Public agencies may not be driven by profit but they can be driven by costs and their decisions to outsource to corporations may be influenced by the decision to reduce their own accountability for outcomes (c.f. Adamson et al., 2016; Carnoy, 2000; Chubb and Moe, 1990; Cuban, 2004; Levin, 2001; Lubienski, 2005; Scott, 2005).

A third (more recent) line of research has focused on the role of corporate actors within broader policy networks and streams and the role of power as deployed by corporate actors within these networks (c.f. Ball, 2012; Hogan, 2015; Verger et al., 2016; Gulson et al., 2017). As part of a broader body of work (in policy sociology) and on policy networks, this research examines how corporate actors within policy networks participate in the production of education policy (c.f. Ball, 2012; Ball et al., 2017; Münch, 2020). This work has emphasized the interdependence and intersectionality between corporate actors and state actors including international organizations, states and schools (c.f. Au and Ferrare, 2015; Lingard, 1993). Corporations as part of broader education reform networks operate locally and globally and across different parts of the world (c.f. Bartlett and Vavrus, 2015).

Policy entrepreneurs are integral to the activities of for-profit education corporations. For example, Nambissan and Ball (2010) highlight the role of "policy entrepreneurs" such as James Tooley, a British academic, who acted as a key nodal intellectual in choice advocacy as well as the for-profit education for the education of the poor in India. As a former consultant of the International Finance Corporation, Tooley directed the global study of investment opportunities for private education in developing countries for the IFC—the private finance arm of The World Bank." Research for advocacy by Tooley and others was undertaken in poor settlements of Hyderabad in the newly formed southern state of Telangana in the early 2000s (Tooley, 2009; Smith et al., 2005). As the state-run schools were not performing, claims were made that the poor willingly chose and paid for private education. The findings of the study were used by profit think tanks, media, research cohorts in academic institutions and in academic journals, and the multinational organizations, with policy entrepreneurs acting as intermediaries.

Thus, rather than separate, the research enterprise is a part of for-profit corporate activity in education. To offer another example, the corporate driven international school quality surveys such as PISA and TIMS have tended to depict government schools specifically in the global south as inefficient and of low quality and in doing so, to make a serious case for corporate involvement. In India, the role of Annual Survey of Education Reports (ASER) is a case in point. This corporate driven large-scale survey of learning achievements in its initial years was used to survey government run schools and concluded that the state schools were poorly performing and inefficient. More recently, in response to criticism (Vellanki, 2015), the ASERs have included private schools. While the ASER (2015) suggests that there have been substantial differences in learning achievements between the government and the private schools, the data presents a much more mixed account. The ASER report (2018) used point in time data to make the case that private schools were better than public schools, and the report's authors interpreted the data to support the expansion of low-cost schools.

What are the effects of the involvement of FPCs in education in terms of geopolitics and equity?

The intent and effects of involvement of for-profit corporations has been different in diverse national contexts. The differences exist in terms of not just the spread of educational services provided and produced, but also in terms of the role they play in education policy making or in transferring some of the policy ideas from one national context to another. Nambissan and Ball (2010) argue that the biggest contribution of for-profit corporations in education across the world is that they disseminate education policies through policy transfers and policy entrepreneurship and in the end result in what they call "policy convergence."

If we consider privatization of education as a critical response to the so-called failure of public education systems, then the starting point of privatization of educational provisioning has occurred in different periods of time in different national contexts. For example, while the contemporary privatization agenda became significant at the end of the 1970s and the beginning of the 1980s in the United Kingdom and the United States (Verger, 2020), their actual arrival in the global “South” has happened after almost two decades, mostly in the 1990s or in the early years of the new millennium, by which time the experiences of those initial experiments in the global “North” have yielded not much success. The UK and the US are “reform laboratories from which experiments are exported around the world” (Nambissan and Ball, 2010: p. 325), through the Transnational Advocacy Networks (TANs), which “change national government behavior through the exchange of norms, ideas and discourses” (Nambissan and Ball, 2010: p. 326).

What is significant to note is that the language of the FPCs in the emerging neoliberal contexts of the global “South” and the global “North” is qualitatively distinct. At times, the failed policies of the North made their entry into the South and survived due to the highly unequal hierarchical social as well as educational order in those societies. A pro-profit idea like the voucher system is one such example which has not worked in one context (the global “North”), but is applied in another context (global “South”) with the promise of mitigating social and educational inequities and the provision of good quality education. In India, the advocates of for-profit education (Das, 2020; Kathpalia, 2016; Kingdon, 2015) call for dropping the constitutional ideal of socialism as it disallows a private schools from making profit and thereby what they claim will harm the interests and aspirations of poor parents and children. Advocates claim that the single change in designation from “non-profit” to “profit” sector could create new market mechanism. Investments would flow rapidly into education, improving choice and quality (Das, 2020). This kind of advocacy, drawn from the corporate world and the FPCs, seek to advance for profit interests in the name of reforms, without considering concerns of socio-cultural and political economic contexts of societies in the “South.”

To be specific, the most significant feature of advocacy for reforms in the global “South,” particularly in India and Sub-Saharan Africa is that there is a clear absence of policy framework (even if it exists, it is fraught with a total lack of regulation), which enable proliferation of schools outside the public sector, which then results in mushrooming of unorganized, unregulated and unrecognized educational market for the poor in the name of low-cost private schools or budget schools. Phillipson (2008) foresees the emergence of a private education “that charges a fee that is low enough to be affordable by the poor families” (p. 1). He argues that this low-cost private education is seen as a “popular alternative to the public education system” (2008: p. 1) in countries like India, Nigeria and Uganda.

While it is difficult to precisely define the private-ness of the low-cost private school, Phillipson does point to what it is not, which help us understand what it actually is:

“It is not a school run by a religious organization for charitable religious organization for the furtherance of a particular set of moral values or beliefs. It is not a school offering an educational advantage to its pupils and charging a high price for a privilege of gaining access to it ... it is not a school set up by the local community until the government agrees to take over ownership. In contrast to these distinctions, the low-cost private school is a school that has been set up and is owned by an individual or individuals for the purpose of making profit” (2008: p. 1).

In India, the low-cost schools are generally not recognized and therefore are not listed in the annual census of educational institutions by large scale surveys like DISE and ASER. Moreover, policy makers and political class are complicit in facilitating the growth of for-profit, low-cost schools (Nambissan, 2016). These are usually run at what Phillipson (2008) calls “subsistence level” education and “a pre-occupation with economic survival permeates all activities in such schools” (p. 2). The growth of this sector seems to be the cause and consequence of public school closures post 2014 policy of rationalization of teacher deployment from schools with low enrollments to those with high enrollments, which led to decline in the government schools (Rao, 2017; Phillipson, 2008). In other words, the declining enrollments in government schools is a cause and consequence of not just the governmental policies, but it also indicates a preference for the low-cost schools. In Nigeria and Uganda, in fact, there has been a governmental support to these schools through a provision of matching grants and funds and of instructional materials (Phillipson, 2008).

For parents, “choosing a school is not always a one-off event” (Hill et al., 2011: p. 103). It involves a process of “symbolic expression of identity” (Gurney, 2017: p. 19). They often contemplate, revisit and review their original schooling choices if they perceive that the benefits are no different from their previous choice. Several studies, using Hirschman’s (1970) ideas of exit and voice, explain this process in different contexts. This, some researchers believe, has produced a differentiated school market (Hill et al., 2011; Srivastava, 2013), which in turn produces a stratified education system which internally differentiates poor in terms of their accessing low-cost private schools and those accessing a functional government school in the neighborhood. Thus, increased investment and expanded educational opportunities for the poor through low-cost private schools across the global “South” is not necessarily a panacea for social inequality, disadvantage and poverty (Hill et al., 2011; Nambissan, 2016).

Further, as mentioned earlier, though quality of education is said to be the reason for parental choice for low-cost private schools, the education provided in these schools is found to be of low quality (Kar and Sinha, 2021; Nambissan, 2012; Goyal and Pandey, 2012; Karopady, 2014). Yet, FPCs’ push for this sector of schooling in the Global South can be viewed as a play to secure entry into a potential market that survives on extracting from the poor households for whom accessing education is a necessary condition for escaping miseries of poverty and social disadvantage and to realize aspirations for social mobility. The poor parents see these low-cost private schools as easy and cheap options that can improve schooling as well as living standards for their children (Kumar, 2010).

Thus, the participation of corporate actors and the market-based approaches in both developed as well as developing countries have not made a huge difference to the prevailing education systems that are already unequal (Lahoti and Mukhopadhyay, 2019; Nambissan, 2016). At best, they created differences between sub-regional systems within the same education system and widened

inequities more prominently. Thus, an important consequence of this discourse is the emergence of inequities in terms of national systems and the regional and sub-regional systems and among the social group differences. Differential levels of privatization and corporatization and the widening of inequalities within the regional and sub-regional systems within the same national contexts are well documented (ASER, 2015, 2018). This is made even more complex by ideological orientations of the federal or Union and state/provincial governments, due to which the policy frameworks vary largely.

The FPC's intent in creating more choices for quality and for efficient delivery of provision of schooling has just not to be read as widening of choices, but must be seen as widening of inequities among pockets of affluence and pockets of deprivation; rural and urban spatial contexts; the social, racial, ethnic, gender, caste, tribal and religious minorities. As Kamat et al. (2016) argue, "corporations are primarily accountable to their stockholders and work first and foremost to create returns for investors, which are not necessarily aligned with those of the customers, i.e., the students, their families or their communities" (p. 100). They also endorse the view that "any system of education that increasingly relies on private provision to fulfill the right to education, creates a cycle wherein the poorest and most marginalized have diminishing access to quality education" (Kamat et al., 2016: p. 101). Evidence points to an increased socio-economic segregation as a result of school choice for poor and the disadvantaged (Kar and Sinha, 2021; Kumar, 2010). In such contexts, does diversity get augmented, as Steiner-Khamsi (2018) asks, amid what she paraphrases as a situation wherein "businesses seeing like a state" and "governments calculating like businesses" (p. 382).

The most important consequence of FPC involvement in education is surely not one of bridging educational inequalities in access to quality education, rather to make profits at the cost of the poorest of the poor, which then further widens inequalities as FPCs tend to exclude those who cannot afford and cannot succeed in terms of what they set as standards. State-run education shrinks and gets restricted to the social groups that are most disadvantaged socially economically and are vulnerable and under-represented. As FPC's push low-cost schools in the global south and use research as a political tool to legitimate this expansion, concerns mount about the continued role of the state in the provision of basic education.

Conclusion and future research

Empirical research on the role of for-profit corporations in education reform converges around the following points. First, the phenomenon is best understood as a broad social field that involves not only private for-profit actors but also government and state actors. Government and state actors incentivize much of the work, as opposed to serving a primary regulative function. Further, the distinction between for profit and not for profit actors means little in a context in which large not for profit actors operate as not for profits in name only. These entities operate independently as part of broader policy networks and in this work the role of government actors, not for profit actors and for-profit corporations can be indistinguishable with governments creating new markets and for-profit corporations setting policy. The drivers of this activity are global and as such connected to the rise of global trends such as neoliberalism. However, the manifestations of these trends are often "local"—the meaning and significance of "global" reform activities such as charter schools are locally situated and culturally determined. In all instances, the conflicts around this activity reflect a broader set of tensions around the public democratic purposes of public education and the private interests and liberties of families (and by extension for profit corporations selling choices to these families. The positive impacts of for-profit corporate activity around the claimed goals of increased efficiencies and increased equity are minimal, though still debated given that research on these activities itself is connected to rather than independent from the corporate enterprise. There are significant commercial and political interests at stake in the expansion of for-profit education corporations, particularly at a moment in which the democratic purposes of schools have come under attack and where multi-national corporations, for example in the online-tutoring industry, have felt the sting of government policy.

More serious research and policy attention is needed on the impacts of unregulated school sector that seeks out the poor. It also is important to further explore how the differentiated educational environments that this sector has created produce social hierarchies and internal differentiation in otherwise homogeneous neighborhoods. Research also needs to be directed toward the classroom processes within these schools to examine if these schools indeed are different from the state schools, which has been the sole selling point for the FPCs for entering into the low-cost schooling market. This research must attend not just to impacts but also to what Verger et al. (2017) call, "market making" and their differential social impacts on nations that are yet to universalize provision of their elementary education.

Introduction

Definitions of “geopolitics” center the study of geographical or spatial factors in relation to power and politics, noting the varied ways the term has been used across disciplines and historically. Despite the term apparently being coined in aid of imperialist and racist expansion, it has been at least partially recuperated inside and outside of geography through more critical geopolitical approaches, including in relation to accelerated globalization in the late 20th century (Dodds, 2007). Human-induced global climate change has resulted from the mobilities and associated carbon emissions of that globalization – including the spread of market-based cultural systems, and increased mobilities enabled by fossil fueled technological and travel infrastructures (Urry, 2007). “Uneven development” notwithstanding (Smith, 1984), global fossil fuel driven economic and technological systems have ushered in a new geological epoch. Humans are now changing the climate of the planet, and along with it, the planet’s varied geographies and their habitability for humans and other species.

The latest Intergovernmental Panel on Climate Change report (IPCC, 2022) offers a grim summary of the geopolitical impacts we are already locked into over the next decade – millions more living in extreme poverty, lack of food and water security, sea level rises, increased mortality due to extreme weather events, biodiversity loss, and more. It also outlines the prospects of not taking significant future action to reduce and adapt to climate change, including the loss of habitability of the planet for increasing numbers of species, including humans. Despite this, many communities and countries remain stuck in various forms of climate denial and inaction, supported by policy and political systems that are failing to address climate change within the timeframes needed (Ford and Norgaard, 2020).

Education and communication are articulated in the original United Nations Framework Convention on Climate Change (UNFCCC, 1992) and again in the Paris Agreement (UNFCCC, 2015) as key to developing the social and political will for increased action. Despite this, many national education remain overfocused on student academic achievement and workforce readiness (Gorur, 2017), prioritizing individual and national economic gain over planetary health. Like rearranging deck chairs on the Titanic, our collective inability to process and respond more adequately to the global climate crisis including in education is a global issue in urgent need of political and policy action. This paper overviews some of the sociopolitical factors at the heart of this inadequate response to the geopolitical shifts of climate change, and implications for education policy.

Micro, meso, and macro sociopolitics of climate change inaction

In Rich’s (2013) novel *Odds Against Tomorrow*, two main characters have inverse reactions to the physical and social realities of the world post dramatic climate change. Mitchell Zukor addresses his “real, hot, viral” fear (p. 25) by researching and predicting possible climate change disaster scenarios. In contrast, the ill Elsa Bruner builds an idyllic eco-retreat, living in a “permanent condition of hopeful, childlike, brainless bliss” (p. 62). Through their written correspondence, Rich’s characters weigh the relative merits of cultivating rational fear versus fearless curiosity in the face of death. In contrast to these opposing reactions to climate catastrophe, in the novel most New Yorkers “carried on with their usual activities, pantomiming quotidian normalcy, as if nothing were wrong” (p. 102).

In her research on living in denial of climate change, Norgaard (2011; with Ford and Norgaard, 2020) investigates psychological and sociological responses to climate change. She adopts the term “double reality” to describe the disjuncture between the collectively constructed sense of normal everyday life, and the troubling knowledge of the causes and impacts of climate change. Like Nathaniel Rich’s New Yorkers, the participants in Norgaard’s (2011) study manifested signs of such a double reality, as they recognized the impacts of climate change, but nonetheless remained in a state of inaction and denial. A number of other studies have found that increased levels of knowledge about climate change have a negative effect on concern and sense of responsibility (Kellstedt et al., 2008; Krosnick et al., 2006, cited in Norgaard, 2011, p. 2). Some have linked this with the inability to perceive issues over which one has little control, as matters of concern. For example, Lifton (1982) researched “psychic numbing” as a response to the possibility of nuclear catastrophe – with numbing coming not from a particular traumatic event, but from a crisis of meaning: “We know that our lives can end at any moment, yet we live as though we do not know this.” (Norgaard, 2011, p. 4). As a result we

perform “double lives,” or what Norgaard calls a “double reality,” in which everyday normal life coexists with the troubling knowledge of climate change and its impacts on human and other life forms.

Norgaard draws on the sociology of cognition to explore how we are socialized to pay attention to different information on climate change through shaped systems of perception and attention: whether climate change “is considered morally offensive or not is a function of whether it is inside or outside socially defined limits of concern” (Norgaard, 2011, pp. 5–6). This social shaping of our understandings and thought patterns has been termed the “social organization of denial,” in other words, “we learn what to ignore, and only then does its irrelevance strike us as natural or “logical” (Zerubavel, 1997, p. 47). Culture shapes such social organization, not by providing guiding values, but through assemblages of “symbols, stories, rituals and world-views,” including via emotion and affect (Norgaard, 2011). In the case of climate change, individuals collectively distance themselves from information because of cultural norms of emotion, conversation, and attention, and through using an existing cultural repertoire of strategies in the process, such as the perpetuation of national or cultural narratives which are incongruent with action on climate change.

Power and politics drive these habits of attention and action that constitute our cultural norms of social organization. As Norgaard (2011), suggests, “Cognition, awareness, and denial emerge from a process that spans micro-, meso-, and macrolevels of social structure. At the microlevel, we see the role of individual emotions and interactions. At the mesolevel of culture, norms of behavior from conversation, feelings, and attention shape and reinscribe what is considered “normal” to think about, talk about, and feel. And these local cultural norms are in turn connected to larger political economic relations.” In her book on “neoliberal exceptionalism and the culture of uncare,” Weintrobe (2021) suggests that the roots of the climate crisis lie in part in a psychology of exceptionalism that, she argues, became more pervasive due to the spread of neoliberal politics globally over the past half century. This includes characteristics such as seeing oneself or one’s group as ideal, as entitled to the power and possessions one craves, and not feeling morally troubled about this (p. 19). She describes this as enabling increasing numbers of people to live in a “bubble-like psychic retreat from reality” (p. 23). This “group denial” can be attributed with being responsible for the slow and inadequate response to climate change (Weintrobe, 2021).

Other studies have identified that this group denial is often along political party lines – with political affiliation and ideology being the most significant predictors of climate change belief and action (e.g., Kahen, 2012). Still only 60% of the United States (US) population believes climate change is mostly caused by human activities (Sinatra and Hofer, 2021), with 2021 Gallup Poll findings showing a widening gap between Democrats and Republicans: 67% of Democrats “now consider global warming a serious threat to themselves,” versus 11% of Republicans (a 56 point difference, up from a 38 point difference in 2016, and 16 points in 2001) (McKenzie, 2022). While many studies on the increasing polarization in views on climate change have focused on the US, other countries also have growing segments of climate contrarianism and other forms of science denial, including along political party lines (Urman, 2020). For example, in Australia, Liberal and National party supporters are less likely to accept the scientific consensus on anthropogenic climate change than those who identify with the Green and Labor Parties (Tanter, 2021). The growing polarization, including on climate change, has been linked to a range of factors, including increased globalization and economic disparity, a growing financial elite and associated think tanks, and increased misinformation shared through social media platforms and communities (Moffit, 2016; Zembylas, 2021). For example, contrarian blogs and social media sites have been found to be linked to the funding flows and messaging of prominent climate denialist think tanks and private donors (Coan et al., 2021), with public perception on climate change in part shaped through these digital spaces (McKenzie, 2022; Papacharissi, 2015).

All of this also applies to students and the communities at school and out-of-school that they belong to; and likewise the micro, meso, and macro forms of social organization, or political affiliations and “denial groups” that families, teachers, and education policy makers are embedded within and how these shape their responses to climate change. Pilot research suggests that the personal sentiments and beliefs of policy makers may be particularly key to whether climate change is included in education policy (McKenzie, 2017; Pitton and McKenzie, 2020). More broadly, there has been minimal research to date on how policy makers’ social and affective orientations to issues may influence their policy making. Cooper (2009) also pointed to this gap of attention in policy studies, suggesting a need for more research on the “messy” emotional influences on policy making. He suggested this could include a focus on the ways that broader societal structures of feeling shape the orientations of policy makers to the issues on which they are decision making (Williams, 1961; see also Armstrong, 2004). Some studies have explored whether there is shared “habitus” or more common dispositions among policy makers. For example, Lingard et al. (2015) identified that common qualities in a sample of education policy makers were being middle class, high modernist, cosmopolitan, and scientific in orientation. A few other studies have examined the broader sociopolitical factors that may influence policy making, such as fear for the future or anxiousness about economic precarity (Borén et al., 2021), as well as the use of emotion in policy texts (Jupp et al., 2016). However, the education policy literature has yet to fully examine the sociopolitical lives of policy makers for how these may influence their policy making, including in relation to climate change.

Where and how climate change can be included in education policy

Focusing on forms of climate change denial and inaction more broadly, Candis Callison (2014, 2020) discusses how, why, and when climate change *does* come to matter and what that looks like across a range of populations and geographies. In climate change ethnographies of northern Inuit communities, a business sector, a Christian association, and other forms of social organization, she found that when “climate change” is engaged, it occurs through the frames and language of that demographic. Thus, rather than treating climate change as a matter of fact, or as merely coalesced “scientific consensus,” Callison inquires into how various groups

translate the issue of climate change into their own vernacular, defining climate change within and for their own group. This involves, according to Callison, “an assemblage of institutions, material training, disciplining mechanisms, and modes of speech” (p. 15). She writes, “The fact of climate change does not advocate, on its own, for taking action now or in the future – it is the presentation of the facts, their socialization and communality, and inherent moral and ethical dictates that determine the need for immediate action” (p. 15). Through these means, Callison suggests climate change can shift from being a “matter of fact” to being a “matter of concern” (Latour, 2004). In other words, climate change is more likely to matter to individuals, including policy makers, when it is framed in the values, narratives, and priorities of the affinity groups to which they belong. Likewise, Ford and Norgaard (2020) point to how dialog and other cultural tools can decrease the dissonance experienced in encountering climate change, and thus open up greater possibility for social engagement.

While still an emerging field, research suggests that climate change education can engage these considerations through a more holistic approach. This entails including a focus on knowledge, or the cognitive (e.g., climate science literacy), but also on socio-political considerations (e.g., group denial, climate grief) and an action-orientation. Understanding the action that can be taken, and becoming involved in that action, can help counter emotions of denial, fear, or loss. A range of interdisciplinary research also suggests that framing climate change education messages in ways that are locally relevant and meaningful can help in overcoming climate change denial or inaction (Hargis and McKenzie, 2021). Such framings are important given that social group and political affiliation are the largest predictors of climate denial and inaction (Kahan et al., 2012). A review of the literature of climate change education also found that deliberative discussions, addressing misconceptions, and implementing action projects are promising strategies for climate change education (Monroe et al., 2019). A whole institution approach to climate change education involves incorporating climate change education within overall institutional governance (e.g., strategic plans), teaching and learning (e.g., curricula across all subjects), facilities and operations (e.g., reduce building and data energy emissions), community partnerships (e.g., collaborations with municipalities or Indigenous communities), and research (at the higher education level) (Hargis and McKenzie, 2021).

Addressing colonialism and climate justice are also central to climate change education. This includes given the land-based impacts of extractivism, and that those most impacted by climate change globally are often those who have contributed the least. Elsewhere, myself and Cree colleague Alex Wilson have outlined the importance of land-informed policy in education when engaging with climate and sustainability issues (McKenzie and Wilson, 2022). Rather than simply turning to globally mobile approaches, such as the UN Sustainable Development Goals (SDGs) which in some cases can prevent or undermine progress, local approaches can be land-informed, including in relation to Indigenous knowledge and priorities. Versus 17 SDGs, from which an institution can pick and choose which Goals to prioritize and report on for ranking systems, locally developed Indigenous knowledge principles can be more holistic and interwoven. This can offer a policy path that is described by Indigenous policy makers as both decolonizing and furthering of environmental sustainability, as well as advancing Indigenous cultural and language survivance and resurgence (McKenzie and Wilson, p. 13; see also McKenzie et al., 2021).

While education is increasingly recognized as key to achieving the necessary climate action globally within the necessary timeframes (IPCC, 2022; UNFCCC, 1992, 2015), still relatively few countries currently have a focus on climate change in their education systems, or education in their climate change approaches, indicating a critical gap in education and environment policy making (McKenzie, 2021; UNESCO, 2021a). For example, national curriculum frameworks from 100 countries (52% of UNESCO member states) were analyzed for inclusion of climate change content, with almost half (47%) of the countries making no reference to climate change (UNESCO, 2021a). When climate change content was mentioned, the inclusion was often cursory. A systematic review of existing studies also suggests that climate change education is not often included in education policy and curricula (UNESCO, 2021b). When addressed, it is often through soft governance mechanisms, such as curricular guides, versus policy or curriculum (UNESCO, 2021b). The type of inclusion tends to focus on learning “about” climate change (within the subjects of science and social studies) or technological solutions, rather than developing sociopolitical and action capacities (UNESCO, 2021b). This study also suggests that “justice” and “Indigenous knowledge” were infrequently engaged in relation to climate change in the curriculum and policy documents reviewed (UNESCO, 2021b). Likewise, a recent review of education policy and education standards across all 50 US states and Washington DC found that only four states (Indiana, Minnesota, North Carolina, Oregon) linked Indigenous knowledge with climate change education content (MECCE Project and NAAEE, 2022).

Conclusion

While countries are making progress toward including climate change in education policy, much more work remains to be done to further the quantity and quality of climate change education globally. To date, there has been a lack of research to understand the reasons for these gaps in education policy making on climate change (Aikens et al., 2016). However, given the broader literature on the sociopolitical factors in climate change belief in action, it seems engaging further with the micro, meso, and macro understandings and contexts of policy makers seems key to increasing the extent and quality of focus on climate change in education policy.

While global policy initiatives are championing an increased focus on education policy making on climate change (UNESCO and UNFCCC, 2016), the national and subgroup politics of policy makers and schools are also important. Broader trends in political polarization, social media influences, and science denial are barriers to policy makers, communities, and families acting to include climate change in education policy and practice. Education, in turn, is essential for helping build the social and political will in the broader public to address this urgent issue of the 21st century.

Ecopedagogy is a collection of environmental pedagogies that emerged from, and is grounded in, the work of Paulo Freire (Kahn, 2010; Misiaszek, *in press*; Misiaszek, 2012; Gadotti, 2008c; Gutiérrez and Prado, 1989). Ecopedagogical teaching is for students to better understand the inseparability of environmental and social violence (socio-environmental connections); the politics of formal, nonformal, and informal education that falsely separates the two; and that “sustainability” must be planetary in scope (i.e., sustainability that includes all of Earth) (Gadotti, 2008a, 2008b; Misiaszek, 2020b).¹ As Freirean pedagogues teach through dialectically problematizing why oppressions take place (Gadotti, 1996; Morrow and Torres, 2019), ecopedagogues center problematizing on why unsustainable environmental violence takes place. The following two questions are key to continuously pose and re-pose contextually in ecopedagogical teaching. What are the local-to-global politics of why unsustainable environmental violence occurs? Who benefits and who suffers from false socio-environmental splitting? Inquiries on identifying negative consequences must encompass non-anthropocentric analysis with all of Nature, including when the term “who” is used. Coinciding with Freire (2000) problematizing the politics of education that justify oppressive acts, especially banking education models, ecopedagogues deconstruct how politics of (environmental) education justify acts of unsustainable environmental violence.

This chapter has three objectives. First, to define what is ecopedagogy and ecopedagogical literacy as an overall pedagogical aim of its teaching. The former will be done by explaining ecopedagogical teaching to critically unpack why environmentally violent acts occur, its planetary inclusiveness, and its Freirean essence. How ecopedagogy differs from other environmental pedagogies such as environmental education (EE) and education for sustainable development (ESD) will also be discussed. The importance of recognizing that these and other environmental pedagogies have diverse pedagogical framings and objectives that coincide and conflict with ecopedagogical ones will be explained. The latter aspect of defining ecopedagogical literacy coincides with this chapter’s second objective of delving into some key themes essential for teaching students to ecopedagogically read. These themes, as follows, were selected to coincide with this encyclopedia section’s topic “globalization and shifting geopolitics of education”: reading “development” and sustainability, reading processes of globalization, reading citizenship (local-to-planetary citizenship), reading through diverse ways of knowing and the politics of global epistemological dominance, and reading within our increasingly digitalized world. The third objective is arguing the need for ecopedagogies for transformative praxis from education for crucial paradigm shifts leading toward globally all-inclusive environmental justice *with* planetary sustainability.

¹The article “the” will not be used with “Earth” to not linguistically objectify Earth and will be upper-case. Nature will be upper-cased also with the same reasoning.

Essence of ecopedagogy

Ecopedagogy specifically focuses upon humans' interactions with the rest of Nature that leads to injustices and unsustainability. Sustainability is planetary in scope, in that balance and wellbeing is for all humans and all that exists outside the anthroposphere (i.e., all of Nature). There are endless complications in achieving planetary balance and is likely better conceptualized as a utopian goal, akin to a horizon or the North Star (see [Teodoro and Torres, 2007](#)), to give direction but highly unlikely to be fully achieved (utopia and education will be discussed more later).

Environmental issues are centered but are not isolated in ecopedagogy from all other happenings in our world. In the same way that teaching through critical race theories focus on racial issues specifically but do not ignore the intersectionalities with other forms of oppressions ([Ladson-Billings, 2009](#)), ecopedagogical work is largely done at these intersections. Falsely justifying environmental violence is largely due to systematically taught socio-historical prejudices, such as racism, and often leads to other forms of prejudices. In other words, learnt othering deprioritizes environmental oppressions of the Other, and objectifying the rest of Nature instills its existence as solely for humans' utilization and commodification. The ecopedagogical aspect of focusing on "globally all-inclusive" justice means that neither socially constructed differences (e.g., culturally, tradition-wise, linguistically, epistemologically) nor physical distances can justify unsustainable environmental oppressions onto others. This is especially important for socio-historically othered populations (e.g., Indigenous, global South, non-whites; these populations will be termed as upper-cased Other(s) in this chapter).

Planetary sustainability *with* goals of global socio-environmental justice is limitlessly complicated and often these two objectives can conflict with one another. For example, unjust food issues can sometimes be alleviated in the short-term by unsustainable farming practices (see [Epstein-HaLevi et al., 2018](#)) or environmental regulations can result in temporary labor injustices. Although these complex socio-environmental conundrums have no simple solutions, democratic, critical dialogue in ecopedagogical spaces on the often-hidden consequences and politics of environmental violence unveils the importance, crucial targeting, and challenges (i.e., "limit situations" in Freirean terminology) to construct possible solutions for needed environmental transformation. This includes interrogating previously taught ideologies that *distance* environmental harms and, in turn, deprioritize negative affects upon the othered "them" and/or objectified nature,² as will be discussed next.

World-Earth de-distancing

Teaching to disrupt education that *distances* us from one another and from the rest of Nature (world-Earth distancing) is essential for any environmental pedagogy to be successful ([Misiaszek, 2018](#)). Distancing is done in various aspects such as geographically, time-wise, and othering. Examples of world-Earth distancing, respectively, are the following: exportation of environmentally harmful production and recycling to the global South; ignoring global warming because effects will occur in the "distant" future; and dehumanizing othered populations, such as through Orientalism ([Said, 1979](#)), that justifies socio-environmental oppressions placed upon those seen as not fully human – i.e., the Other.

Teaching for World-Earth distancing falsely detaches us (i.e., humans) from the rest of Nature and, in turn, devalues and objectifies all which is not human. Neoliberalism, arguably the most prominent tool for world-Earth distancing, commodifies all of Nature as the possibilities for, as Postma argued (2006), profiteering without concern for injustices or unsustainability felt beyond one's own private sphere. Within public spheres, neoliberalism's innate connections to sustaining hegemony above all else, especially global hegemony ([Chomsky, 1999](#); [Harvey, 2005](#)), distances environmental ills placed upon others and the rest of Nature. Within ecopedagogy, how neoliberalism devalues injustices and unsustainability from environmental violence and the politics of neoliberal ideological indoctrination in education is occurring, are central concerns.

Freirean teaching for environmental praxis

Freire wrote on ecopedagogy in his later works (see [Freire, 1997, 1998, 2004](#)) and several Freireans have constructed ecopedagogies by reinventing his work. Reinvention was a key tenet of his work and will be discussed more later in this chapter. His unfinished writings before his untimely death was to focus on ecopedagogy and several passages from this work were posthumously published in his book *Pedagogy of Indignation* ([Freire, 2004](#)) ([Misiaszek and Torres, 2019](#)). Fully elaborating on Freire's essence within ecopedagogy is impossible within any publication length; this chapter will focus on emergent ecopedagogical praxis from teaching through democratic problem-posing dialogue, utopic hope, and contextual reinventions.

Goals of students' actions emergent from teaching vary between pedagogies. Freirean teaching is action-based pedagogies with the goal of ending oppressions ([Gadotti, 1996](#)); ecopedagogues teach not just for understanding environmental ills but for critical reflexivity that lead students to determine necessary actions to disrupt the ills ([Gadotti, 2008b](#)). Teaching for environmental wellbeing is the focus of all environmental pedagogies, although pedagogical goals for praxis is often superficial or absent. Many environmental pedagogies are absent of this described, or similar, goals of ecopedagogical praxis because critical reflexivity through dialectics, diverse epistemologies, and theorizing helps to actively counter hegemony that requires unsustainable environmental

²The lowercasing of nature here indicates the objectification of Nature.

violence to exist (Misiaszek, 2020b). Non-critical, non-dialectic *banking education* models that Freire (1998, 2000) vehemently opposed would be such pedagogies.

Ecopedagogues teach students how they can delve into the political aspects of environmentally violent acts for transformative praxis that takes aim at the deeper roots of these actions. This includes unpacking the politics of (anti-)environmental teaching that influences students' interpretations of environmental violence.

Coinciding with Freirean pedagogy (Freire, 1992), ecopedagogues teach through reflexivity that all aspects of societies are transformable (e.g., economic, political, social). For example, countering commonsense that development "naturally" adheres to neoliberalism needs critical problematizing in education (Torres, 2011), including ecopedagogical problematizing. All schooling is for individual and societal development, but how does dominant ideologies of "development" often justify environmental violence? Closely linked to this problem-posing of development is education for citizenship. How does citizenship lead to solidarity but also deems "non-citizens" as Others (e.g., (neo)colonized, Indigenous persons) and/or geographic solidarities (e.g., city-state, nation-state) leads to largely ignoring distanced ill effects from unsustainable environmental violence (Misiaszek, 2015, 2018). Teaching for both development and citizenship will be further problematized throughout this chapter. Many shallow environmental pedagogies help to sustain/intensify environmental violence by diverting attention away from its root causes and negative effects, as well as instilling that radical transformations are unthinkable (Misiaszek, 2020d). *Pedagogies on environmentalism* may do this purposely or not.

Pedagogies on environmentalism are different from environmental pedagogies, as they might have anti-environmental goals. For example, a transnational fossil fuel corporation giving underlying messages that global warming is still debatable or giving funding for selective teaching resources and educational research that delegitimize environmental concerns worldwide. Or a course on sustainability that deprioritizes environmental wellbeing in the Global South by prioritizing the global North's *Development* (upper-casing of "D" will be discussed later in this chapter).

Generative themes and dialogue

Freire (2000) argued that praxis emerges from critically determining what is currently happening, what "should" be happening, and what are the obstacles/barriers of not achieving the latter, in which he named *limit situations*. This is accomplished through problem-posing education in which both teachers and students democratically determine *generative themes* to teach and learn through, such as pollution which may be affecting those directly in a particular ecopedagogical space. The epistemologies, meanings, and experiences of everyone in the space is brought into the teaching and learning while problem-posing the themes. In addition, bringing in others' diverse knowledges and understandings from outside the learning space is also essential, especially from those who are most negatively affected and whose voices are too-often not heard. For example, bringing in the voices of Indigenous Amazon populations when discussing the local-to-planetary effects of deforestation that, in part, increases global warming.

Ecopedagogical spaces of democratic dialogue is opposite to banking spaces where students are taught *at* because only the teacher has legitimate, useful knowledge. Ecopedagogues create safe spaces so students can have what Friere (1985a) termed as *authentic dialogue*, rather than being meekly malleable by only repeating the teachers' ideologies, knowledges, and opinions. Opposite to systematically structured passive, falsely neutral classrooms that are too prevalent in schooling (Apple, 2004), ecopedagogical spaces, coinciding with critical/Freirean spaces, are full of conflict but are structured to remove any and all types of violence. The diversity of understandings, epistemologies, and experiences deepens and widens everyone's learning within the spaces. Conflict stems from the humanness of our individualized personhood in authentically problematizing the themes together, but also emergent commonalities help to understand others' perspectives. As will be discussed later toward the end of this chapter, intensifying post-truthism threatens such rich conflictual dialogue.

Utopias and hope

Teaching to imagine futures of environmental justice and sustainability is essential for praxis because it allows imaginaries of "what 'should' be happening," as discussed previously.³ Freire (1992, 2000) emphasized the need to teach through reflexivity that our world is *unfinished*, as opposed to banking educators teaching that the world is *finished* with current oppressions as "natural" and non-transformable. A single unsustainable future of socio-environmental injustices and unsustainability instilled within banking (environmental) teaching ceases all possibilities of truly transformative praxis. For example, neoliberal-based teaching normalizes the prioritization of profiteering within one's own private sphere above all else, without environmental concerns or cares (Postma, 2006). Ecopedagogical praxis cannot occur because thinking and imagining outside of neoliberal ideologies is viewed as abnormal and foolish.

Hope and utopia in (environmental) teaching is not "fanciful" dreaming but rather imagined possibilities (or *imaginaries*) grounded in critically understanding the current realities of oppressions (Romão, 2007; Freire, 1992), as well as planetary unsustainability. Reflexivity on the difficulties and hardships that are involved in overcoming limit situations of environmental ills is essential within (ecopedagogical) praxis. The use of diverse critical theories provides lenses to identify and better understand the links between environmental violence and socio-historical oppressions and the difficulties in eliminating limit situations while constructing utopian imaginaries. Freire (2000) expressed that our histories construct our futures; however, he is emphasizing that reflexivity must be through socio-historical lenses rather than any notion of fatalism.

³Futures is pluralized to emphasize the utopian notion that there is more than a single possible future. See <https://en.unesco.org/futuresofeducation/>.

How can students begin to understand unequal environmental ills in the global South without teaching histories of colonialization that have and continue to exploit natural resources and export environmental ills for sustaining Northern profiteering and hegemony? Simply, we cannot. These oppressive processes continue today by globalizations that can be rightfully termed as neocolonialism. Teaching to systematically use critical theories deepens and widens students' understandings of environmental violence through diverse positionalities, histories, and contexts, as well as understanding Nature holistically through non-anthropocentric, planetarism (e.g., Red Pedagogy, see [Grande, 2009](#); ecofeminism, see [Warren, 2000](#)).

Reinventions

Reinvention is necessary so that the "old is capable of remaining new when it remains faithful through time to the experience of original and founding intuitions and inspirations" ([Freire, 1998](#)). Freire argued that reinvention leads to transformative reflexivity and resulting praxis "through the construction of a new nexus between core generative concepts, the diagnosis of emergent historical realities, and testing and refinement of such reconfigurations through new experimental practices" ([Morrow, 2019](#)). These aspects are essential for reinventing Freire in (re)constructing (eco)pedagogies from his work and constructing praxis from teaching. An example of the latter is [Freire \(1985a\)](#) response of countering neoliberal globalization is not "taking power" but 'reinventing power', in which [Morrow \(2019\)](#) views challenges as "twofold: constructing new kinds of more humanizing social relations, which in turn presupposes a better analytical understanding [of] domination and its relation to different forms of power." These aspects of reinventing power can be linked to Southern Theories work on power dynamics of epistemologies of the South/North which will be discussed later in this chapter.

[Gadotti \(2008a\)](#) wrote that the implementation of the UN *Decade of Education for Sustainable Development* (DESD, 2005–2014) must have ecopedagogical foundations, but that contextual reinvention is paramount. He opposed a rigid structure or, worse, a universal step-by-step teaching approach for "successful" implementation which is almost never successful. There is no easy method to Freirean (eco)pedagogy and Freire himself stopped using the term conscientization (*conscientização* in Portuguese) when he began witnessing people using as a non-contextual, over-simplified "method" ([Schugurensky, 2011](#)). This argument for needing contextuality holds true for success in achieving the current UN *Sustainable Development Goals* (SDGs) ([Klees, 2017](#); [Misiaszek, 2021](#)). Contextual reinventions are particularly important for othered populations in which, for example, neocoloniality through globalizations has systematically delegitimize their pedagogies and epistemologies, and de-prioritize "their" injustices and local environmental unsustainability in favor of hegemonic Development.

Ecopedagogy's uniqueness as an environmental pedagogy

Every pedagogy has specific foundations and ecopedagogy is no different. Although EE has specific foundations, it is frequently incorrectly used as interchangeable with the umbrella term of "environmental pedagogies." EE and ESD are the most common environmental pedagogies which have diverse, often-contradictory pedagogical practices, objectives, and goals between and within them. For example, [Sauvé \(2005\)](#) maps out 15 currents of EE with at least one-third coinciding with ecopedagogy. [Jin-kling and Wals \(2008\)](#) map out a contested terrain of ESD – from teaching through critical, democratic dialogue aligning closely with ecopedagogical foundations to teaching for enforcing sustainability that resembles, they argue, "Big Brother" in Orwell's 1984 novel. There are numerous other environmental pedagogies worldwide, including ecopedagogy, that both work within EE and ESD, and are stand-alone pedagogies. It is important to stress that EE and ESD, especially models grounded within Northern epistemologies, are not the only environmental pedagogies and legitimizing them globally as the only ways for environmental teaching is problematic. This includes Western-centric analysis that ignores histories of Southern and Indigenous environmental pedagogies by insinuating that Rachel Carson's book *Silent Spring* (1962) was the main catalyst that initiated environmental teaching everywhere.

ESD largely emerged from various criticisms of EE including the following: not "practical" enough, too conservation-based which ignored social issues, ignored environmental violence connections to social injustices, ignored urban environmental concerns, and disregarded unequal environmental impacts on marginalized populations that, in turn, sustains socio-historical oppressions (e.g., racism, neocoloniality, patriarchy, heteronormativity). It depends on what current(s) are being analyzed when discussing if, and how, these aspects are absent in EE. ESD specifically links human actions to sustainability, including environmentalism (i.e., environmental sustainability) as one of its various aspects categorizing and measuring (un)sustainability overall. This was, in part, a pedagogical move toward more concretely linking environmental violence with social violence.

Ecopedagogical literacy

As [Freire \(2000\)](#) focused on literacy teaching for reading the word to read the world, ecopedagogical literacy is widening this to reading the world as *part* of Earth.

The act of reading cannot be explained as merely reading words since every act of reading words implies a previous reading of the world and a subsequent rereading of the world. There is a permanent movement back and forth between “reading” reality and reading words ... reading the word is not only preceded by reading the world, but also by a certain form of writing it or rewriting it ... of transforming it by means of conscious practical action. For me, this dynamic movement is central to literacy.

(Freire, 1985b).

Ecopedagogical literacy is the ability to critically deconstruct the often-hidden politics of environmental violence that continues injustices and unsustainability (Misiaszek, 2018). It is reading environmental violence through local-to-global-to-planetary perspectives for deepened localized comprehension of environmental issues *with* widened understandings beyond the Local (e.g., national, global, and planetary perspectives) (Misiaszek, 2018, 2022). Ecopedagogical reading aligns with Freirean bottom-up approaches in which praxis to end unsustainable environmental violence must emerge *from* and be guided *by* those who are oppressed by the violence in question (see Gadotti, 1996; Freire, 2000).

There are three important aspects of ecopedagogical literacy needing to be pointed out. First, Freirean bottom-up approaches do not promote the absence of outside/widened understandings and perspectives beyond the Local, but rather opposes “top-down” approaches that ignore and silence the Local. In short, ecopedagogical reading of environmental violence is through local *and* widened understandings and epistemologies. For example, reading the polluting of a river is understanding the environmental impacts from local populations down-river from the pollution source together with experts in fields such as environmental sciences and policies, biology, and chemistry. Better understanding the effects from the pollution and reasons why it happened, as well as possible solutions to stop it, emerges from diverse voices and the taught ability to read the authenticity and politics of the voices to listen to or not.

Second, there are not binarily-determined oppressed:oppressor classifications for specific individuals or populations, but rather it is relational with everyone being both oppressed *and* an oppressor (Torres, 2015). Reading to determine the differing degrees of environmental oppressions due to local-to-global politics is crucial, as well as recognizing that ecopedagogical reading is without endpoints. Environmental ills will ultimately affect everyone negatively, but Beck’s (1992) statement that “hunger is hierarchical, smog is democratic” helps to initially unpack the complexities of differing positionalities, hegemonies, and environmental violence when determining degrees of oppression. However, Beck’s statement needs further unpacking. How does air pollution affect a professor like myself who can work from home and afford air filtration systems differ from migrant workers who work outside 10+ hours per day? What are the socio-historical privileges that I have being a white, heterosexual, male from the global North (e.g., from histories of coloniality, Northern epistemological dominance) that lessens the negative aspects of the same environmental event upon myself as compared to others? Reversely, how am I being oppressed by, for example, global neoliberal systems. Critically reading contextual oppressed: oppressor relativity is essential when characterizing a population or process, including how related terms are discussed or written. Although I do not emphasize this repeatedly in this chapter or any of my work, this aspect is entrenched whenever writing “the oppressed(ors),” oppressive, empowerment, or similar terminologies.

A common question is if the “bottom” is powerless how can they enact change through liberatory praxis from education? Freire (2000) answered this dilemma by utilizing, in part, Hegel’s Master-Slave dialect (Gadotti, 1996), arguing that “only as they discover themselves to be ‘hosts’ of the oppressor can they contribute to the midwifery of their liberating pedagogy.” Anti-environmental pedagogies succeed because their teaching justifies environmental injustices and unsustainability, and systematically veils oppressors as, corresponding to Freire’s quote, parasites. Thus, becoming a “pedagogy of the (environmentally) oppressed” – corresponding to Freire’s (2000) most famous book title and its overall theme. Resistance is lessened by teaching that oppressions are “natural” and “deserving,” which can only be countered in teaching for students’ conscientization of this perverted educational goal (Apple, 2004; Giroux, 2001).

Third, reading the limitations of ecopedagogical reading is crucial. Coinciding with feminist standpoint theories (Harding, 2006), ecopedagogical reading requires reflexivity that an absolute understanding of oppressions outside of one’s own experiences and positionalities is impossible. A US professor spending every waking moment reading, visiting, and conducting research on environmental violence affecting children in South Africa will not have the exact same understandings as a child living in Johannesburg. In addition, epistemological reflexivity is essential in ecopedagogical reading that coincides with Southern Theorists’ (Santos, 2018; Assié-Lumumba, 2017; Takayama et al., 2017) work, which will be discussed more later.

Ecopedagogically reading *d/D*evelopment and sustainability

Critically reading the “D” is paramount in determining what are the pedagogical groundings and goals of specific ESD models. Problematizing what is meant by “development” is central in ecopedagogy. Coinciding with Hardings’ (2006) usage of uppercased Sciences to denote globally dominant, top-down sciences as opposed to lowercased sciences that are bottom-up (e.g., Indigenous sciences) opposite to these characteristics, differentiating lower/uppercasing of *d/D*evelopment can be utilized in similar ways. Below are two passages that begin to describe *d/D*evelopment differences which will be unpacked throughout the rest of this chapter.]

[*d*/*Development* and ecopedagogy:] four defining factors of *esD* [and *Development* (capital and italicized '*D*')]: (1) neoliberal economics as the sole factor of development analysis; (2) deprioritizing economic justice concern by ignoring how development processes sustain/increase hegemony; (3) deprioritizing planetary sustainability for Earth's balance; and (4) local framings of development are disregarded for globally constructed ones 'from above' (e.g. Western *Development* models), denoted by the lower-case, underlined, and italicized '*d*'. [*"D"* or "*d*" not underlined and italicized does not specify the type of development.]

(Misiąszek, 2020c).

I utilize the lower-cased *development* and upper-cased *Development* to indicate, respectively, empowering versus oppressive, holistic versus hegemonic, just versus unjust, sustainable versus unsustainable, and many other opposing framings of who is included within "development" and framings of *d*/*Development* goals. There are no absolute origins or framings differentiating between *d*/*Development*, but rather the essence and outcomes of their framings ... Constructs of *development* that counters growth towards and emergent from *Development*.

(Misiąszek, 2020b).

Some key problem-posing questions are the following: whose development is focused upon and not; is the rest of Nature outside of humans considered in development and, if so, to what extent; who defines development that is globally characterized as "legitimate," and what aspects of development are prioritized or not (Misiąszek, 2020c, 2022)? Such questioning is increasingly important and complicated within our globalizing world as "local happenings are shaped by events occurring many miles away and vice versa" (Giddens, 1990).

It is important to note that oppression/empowerment is contextually framed and relative, aligning with the previous argument that oppressed/oppressor categorization is not binary. However, ecopedagogical reading is grounded on the goal for globally all-inclusive justice and planetary sustainability, including the reading of development. Although relative, ecopedagogically reading *development* is guided by this utopic goal in which critical reading others' (de-)development and (un)sustainability for all of Nature is crucial for praxis? This is essential in ecopedagogically reading development, as well as all terms linked to (anti-)environmentalism.

Ecopedagogical teaching of sustainability actively disrupts "commonsense" that justifies actions result in negatively affecting anyone worldwide and devasts Nature, and the accompanying fatalism encouraging the notion that "this is just how the world is." Ecopedagogues teach to critically understand sustainability as plural in goals, scope, and measurement; the politics of and between these three; and the connections with development. Planetary sustainability is the ultimate goal of environmentalism and its teaching, rather than ending all environmental violence. Although this may sound initially counterintuitive, its logic is from the ecopedagogical assumption that all human acts of environmental violence occur to benefit some population(s) (Misiąszek, 2018). For example, deep-ocean drilling for a thick, viscous substance would be a fool's task unless that substance provided energy when refined. Ecopedagogical reading includes determining if acts of violence are sustainable or not, and, inseparable to this, who suffers from them. There are continuums of environmentally violent actions, such as from deep-sea oil drilling given in the previous example, to turning on a computer powered by fossil fuels when plugged in or by a battery composed of mined natural resources.⁴ The reason for writing the phrase "unsustainable environmental violence" throughout this chapter is due to this logic.

Terms of sustainability framings vary, including the following: *environmental sustainability* which environmental pedagogies focus upon; *planetary sustainability* that grounds the importance of sustainability for all of Earth including and beyond anthropocentric concerns (framing most utilized within ecopedagogy); and *sustainable development* to balance acts of "progress" within the anthroposphere (specific goals of ESD, ESD is environmental if also prioritizing one or both of the other sustainability framing(s)). These and similar sustainability terminologies are often incorrectly used interchangeably; ecopedagogues teach to read what specifically is (de)prioritized and (de)legitimized when sustainability is uttered, and the underlying politics. Stating "sustainability" or even a specific sustainability framing is insufficient in ecopedagogical work, as sustainability also forms contested terrains within and between them. What is the scope (local-to-planetary) of sustainability goals? Who is included and who is not when measuring sustainability? Is social justice *with* peace included in being "sustainable?" How does economic and labor justice factor in on sustainability, or not, as Apple has emphasized that we should be reflexive of these and other justice issues connected with energy sources every time we turn on a light switch.

Planetary sustainability is balancing our subjectively constructed world (i.e., anthroposphere) with the objective, static laws of Nature guiding the rest of Earth.⁵ Freire (2000) argued that only humans can cognitively develop and transform the world with the ability for socio-historical reflexivity and forming praxis from dreaming, while the rest of Nature reacts, adapts, and evolves. The rest of Nature returns to equilibrium while humans, often to our own detriment, can counteract Nature's balance in actions determined by our reflexivity. For example, hurricanes and tornadoes result from Nature returning to equilibrium from unbalanced atmospheric pressure systems. This is not considered an act of environmental violence because there is not cognitive reflexivity that cause the high-speed winds. In the same vein, a non-human animal attacking a hiker is done instinctually from possibly being hungry or fears of being threatened, but without the reflexive abilities to understand how the hiker will suffer. This scenario is not one of injustice

⁴Michael Apple discussed these continuums of environmental violence in lecture series at Beijing Normal University (BNU), China in September 2013 and November 2019.

⁵Objectivity refers to the laws themselves and not humans' interpretations of them, which can be subjective.

upon the hiker because all non-human beings lack the reflexive ability of being (un)just (see Warren, 2000 on ecofeminism). These two examples become acts of environmental violence when our actions increase the frequency and/or intensity of these happenings, such as global warming increasing the number and strength of storms or altering animals' environments that cause them to attack humans more often. Ecopedagogues teach to unpack the connections of our actions with these and similar occurrences are too-often dismissed as "just a part of Nature."

Lastly, reading to determine the local-to-global constructed *baselines of sustainability* is crucial, as well as critically comparing the commonalities and differences between baselines' goals and politics. If today's socio-environmental conditions form the sustainability baseline – no further unsustainability will happen beyond what is happening today – then current oppressions from environmental violence will only continue. This is far from leading to all-inclusive environmental justice and planetary sustainability.

Ecopedagogically reading globalizations

The politics of global governance is difficult to unravel and hegemony is often sustained by globalizing agents veiling their influences,⁶ especially in education (Dale, 2007). Teaching to better understand how globalization influences environmental (in)justice and (un)sustainability is extremely complicated because the root sources, processes, and politics of environmental violence are purposely hidden. For example, transnational corporations such as ExxonMobil or Nestlé will not publicly state their unsustainable environmental actions, but they will tout their superficial environmental projects and funding as a smoke-and-mirrors technique. Today's intensifying globalization forms a contested terrain of processes *from above* and *from below* (i.e., plural globalizations as termed by Torres (2009)) which need students to be taught how to critically unpack who actually benefits and suffers from globalizations, as well as all the associated politics (Kellner, 2002; Torres, 2009). For example, reading through theoretical lenses of globalizations, ecofeminism, and ecoracism lenses helps to better understand how marginalized populations will be overwhelmingly affected more by global warming with an estimated 25 million to one billion environmental migrants by 2050 (International Organization for Migration (IOM), 2014).⁷ According to the IOM (2014) the actual number within this astonishing wide-range will depend on "economic growth and development, population growth, and governance" – all requiring ecopedagogical reading on globalizations' effects on these three.

Although globalization from above is diverse, there are certain common goals of the processes overall (Torres, 2009; Stromquist, 2002), including politics influencing environmental teaching (Klees, 2017; Misiaszek, 2022). Neoliberal globalization, which is the most common process from above, has individual profiteering, sustaining current hegemony, and monetarily measuring and ranking all aspects of society, including education, as its goals. Neoliberalism is complex, multifaceted, and has local-to-global-reaching tentacles (see Harvey, 2005; Klees, 2008). Reading to deconstruct globalizations that intensify anti-environmentalism is essential for praxis that disrupts them, as well as determining possibilities of reconstructing the processes to become globalizations "from below" for environmentalism (Misiaszek, 2012; Kahn, 2010). It must be emphasized that there is no simple approach to ecopedagogical teaching and reading, including false notions that everything from the Local or Indigenous is environmental and, opposingly, that all which comes from international agents of globalization is simply anti-environmental. Rigorous, critical reading and re-reading is needed.

Ecopedagogically reading citizenships (local-to-planetary)

Similar to globalizations, local-to-national-to-global-to-planetary citizenship spheres (i.e., citizenships) form contested terrains, especially the coinciding and conflictive intersectionalities between citizenships (Torres, 2017b; Misiaszek, 2015, 2018). Framing citizenships is well beyond geographic location, especially in education when discussing refugees (McNamara, 2007), Indigenous populations and coloniality (Grande, 2009; Abdi et al., 2015; Memmi, 1967; Said, 1979), and Nature beyond the anthroposphere (Gadotti, 2008b; Gutiérrez and Prado, 1989; Misiaszek, 2018). Problematizing how students are taught to determine their "fellow citizens" and how to treat everyone else (i.e., non-citizens), including the rest of Nature, begins to unpack the roles of citizenship education on (anti-)environmental actions. Most global citizenship education (GCE) models have everyone worldwide as fellow global citizens; however, if justice and sustainability are centralized pedagogical goals, or even goals at all, is dependent on the model in question (Misiaszek, 2018; Abdi et al., 2015). GC/E has numerous categorizations, including Lynette Shultz (2007) categories of teaching for neoliberalist, radical, and transformationalist GC. The two latter models can be viewed, and will be termed in this chapter, as *critical GC/E* models. Planetary citizenship education models inherently have planetary all-inclusiveness and these goals as foundational.

There is an innate conundrum in using citizenship terminology with being "global" or "planetary." Lee et al. (2004) argues that historically citizenship education was for populations to be more homogeneous (e.g., same ethical, morality, value groundings) as opposed to critical GCE which is centered on valuing cultural heterogeneity. In addition to this, planetary citizenship includes the quite radical incorporation of non-humans and Earth holistically. Torres (2017b) partially addresses this conundrum by arguing that there are shared *global commons* valued by everyone worldwide and provides the following three:

⁶Scholars differ on who are the agents of globalization. Stromquist (2002) names the following five: central and weak states, transnational corporations, mass media, global financial institutions, and non-governmental organizations (NGOs).

⁷*Environmental refugees* is arguably a better term despite the political pressures for the United Nations not to officially use this term which calls for ecolinguistic analysis in ecopedagogical spaces.

[1] ... our planet is our only home, and we have to protect it through a global citizenship sustainable development education, moving from diagnosis and denunciation into action and policy implementation ... [2] global peace is an intangible cultural good of humanity with immaterial value ... [3] seeking to fulfill their individual and cultural interests and achieving their inalienable rights to life, liberty and the pursuit of happiness ... The great question about peace is how to cultivate the spirit of solidarity across the lines of difference.

The first global common is directly linked to ecopedagogy, but all three are inseparable from each other and have endless socio-environmental aspects throughout them. [Torres \(2017b\)](#) argues that GC/E will ultimately fail if we do not have globally common goals rooted in justice, peace, and sustainability for our world. In addition, [Torres \(2017b\)](#) views that GCE cannot be successful if it entirely counters traditional citizenships, but, rather it must add value to State citizenships (e.g., national citizenship).

Teaching critical GCE *with* ecopedagogy helps students to unlearn othering that is inherent in most sub-global citizenships' ideologies and connects the rest of Earth. Ecopedagogy is essential within GCE, in part, because it provides pedagogical tools for deepening and widening students' reflexivity for better environmental praxis to become active critical global citizens ([Misiaszek, 2018, 2015](#)). The reasons for needing critical GCE within ecopedagogy stems from the necessity of reading conflictive citizenships' framings that influence (anti-)environmental acts as discussed throughout this chapter ([Misiaszek, 2018, 2015](#)).

Ecopedagogical teaching for world-Earth de-distancing is inseparable with critically teaching citizenships. Teaching to become a planetary citizen is most directly connected to such de-distancing, as can be read by [Gadotti's \(2011\)](#) quote below.

[Planetary citizenship is] based on a unifying vision of a planet and a worldwide society. It manifests itself in different expressions: 'our common humanity', 'unity in diversity', 'our common future' and 'our common homeland'. Planetary citizenship expresses a set of principles, values, attitudes and behaviours that brings a new perception of the Earth as a single community. Frequently associated with the concept of 'sustainable development', it is much broader than simply a relation with the economy.

([Gadotti, 2011](#)).

Gadotti has stated that if Earth holistically is a citizen as most planetary models indicate, then Earth is the most oppressed and voiceless citizen. Considering Earth is a citizen, as well as other conceptual aspects of planetary citizenship, is at odds with dominant Northern epistemologies that objectifies and commodifies the rest of Nature, a topic expanded upon in the next section.

[Gutiérrez and Prado \(1989\)](#), who wrote the first book on ecopedagogy, argue below that forming new ways of building widened collectivist relationships in planetary citizenship is both needed for actively striving for utopian goals and also elicits utopianism.

The meaning itself, the sense that personal or collectively we can guide our path, it is the cornerstone on which significance must rest of planetary citizenship. This rationale it opens wide the door of possible and hopeful relationships. Our existence should no longer be an a priori imperative of obligations to fulfill, but a being open to the new reality, full of suggestions and possibilities. This dimension of openness and flexibility puts us in front of an education conceived as the creation of new and possible relationships.

Ecopedagogues facilitating imaginaries of, and emergent from, planetary citizenship constructs help to reinvent relationships with one another and the rest of Earth that is essential for praxis toward a just, peaceful, and sustainable planet ([Misiaszek and González, forthcoming, 2022](#)).

Ecopedagogically reading epistemologies and ecolinguistics

Ecopedagogical reading includes determining what epistemologies are used for teaching the environmental aspect at hand, what epistemologies are absent, what are the resulting (anti-)environmental understandings and actions from these epistemologies, and the local-to-global politics surrounding all this ([Misiaszek, 2020b](#))? Problematizing dominant epistemologies of the North is particularly ecopedagogically important because, as briefly stated previously, their grounding of socio-historical oppressions are obstacles to liberation and planetary sustainability ([Misiaszek, 2019](#) citing [Santos, 2018](#)).

Epistemologies of the South exist to counter Northern (epistemological) dominance, rather than becoming globally dominant themselves, for epistemological contextual relevance and diversity, as [Santos \(2018\)](#) terms as *ecologies of knowledges* which include "knowledges born in struggles." This coincides with [Friere's \(2000\)](#) arguments discussed previously that (pedagogical) liberation must be taught through the perspectives of those who struggle ([Gadotti, 1996](#)). [Tierney \(2018\)](#) argues that teaching and research should have goals of "global meaning making" which, in part, is "not displacing one epistemology with the other but a matter of positioning Indigenous knowledge as significant or primary, with the possibility of it being separate, fused, or integrated with Western ways of knowing." Teaching through epistemological modeling as expressed here is crucial for all environmental pedagogies. For example, ecopedagogically reading Northern groundings of disciplines is accomplished by unpacking their epistemological absences ([Santos](#) named these as *sociology of absences* in his own field) for determining necessary epistemological *emergences* of disciplines (*sociology of emergence*) necessary for liberatory praxis ([Santos, 2018](#)).

Epistemologies that fertilize "commonsense" which justify unsustainable environmental violence and instills hubris that our wants and desires can be fulfilled without considering the rest of Earth, is particularly important to be ecopedagogically read.

This latter aspect of hubris was discussed in Illich's last chapter of his book *Deschooling Society* (1983), which helps ground much of ecopedagogical scholarship. He wrote that *classic* [wo]man[/they] would challenge Nature but would know there would be consequences compared to *contemporary* [wo]man[/they] who falsely believe their actions will be absent of consequences. Ecopedagogical work aligns with Santos (2018) problematizing the processes of (critical) reflexivity when grounded by epistemologies that justify (environmental) struggles of the Other (Misiaszek, 2020b). Juxtaposing Said's (1979) work on Orientalism as justifying coloniality, Northern epistemologies in our globalizing world are, in part, justifying globalizations akin to neocoloniality through environmental violence. This includes languages and linguistics.

Use of language and forms of linguistics have direct and indirect political ideological underpinnings, including how environmentalism, Nature beyond humans, and world-Earth (de)distancing is (mis)communicated in education. Ecolinguistics has many framings; the following two quotes describe some of its overlapping tenets.

[a normative ecolinguistics framework] considers relationships of humans not just with other humans but also with the larger ecological systems that all life depends on.

(Stibbe, 2014).

[ecolinguists view] language is not an autonomous faculty, but it is rather related to other human functions that interconnect with many domains of human life like economy and politics and with other disciplines such as psychology and biology. ... relatively captivated by the idea of inter-relating a linguistic structure that is linguistic units and inter-relations of these units with environment, and here the extra-relations of language are conceived in a dynamic and a global way.

(Demi, 2008).

Ecolinguistics is a crucial tool in ecopedagogical reading to deconstruct communication used to further anthropocentrism, condone unsustainable environmental violence upon others, and objectify and commodify Nature, and vice-versa with ecopedagogical work aiding in deconstructing the politics of language that condones environmental ills (Misiaszek, 2021). For example, reading the language and use of language surrounding differing GCE models leading to (anti-)environmentalism. Dewi (2018) exemplifies this below by calling for GCE intersectionalities within EFL teaching.

EFL [(English as a Foreign Language)] learners by way of metacognitive classroom implementation should aim at respecting the Earth (thus Life itself) in all its diversity as our common home in this interdependent world. It is important to first discuss some theoretical concepts of global citizenship in view of Ecohumanism.

This is one of numerous examples of teaching language and linguistics through GCE models that align with the essence of criticality, ecopedagogy, and planetary citizenship.

Ecopedagogically reading postdigitalism and post-truthism

We now live in a postdigital age, where human destinies cannot be thought of without technologies. In a way, this was always the case – homo sapiens has survived because of technologies such as fire, clothing, and agriculture. But in our world, technologies permeate all aspects of our being. "The postdigital is hard to define; messy; unpredictable; digital and analog; technological and non-technological; biological and informational. The post-digital is both a rupture in our existing theories and their continuation" (Jandrić et al., 2018).

(Jandrić and Hayes, 2022).

The quote above focuses on postdigitalism, but it is also crucial that the larger aspects of media including and beyond new technologies are ecopedagogically read as aligning with and/or countering environmentalism. Teaching through lenses of media culture theories "deepens the potential of literacy education in critically analyzing relationships between media and audiences, information, and power," as well as constructing "alternative media production" to counter oppressions and domination (Kellner and Share, 2007). This unpacking and reinventing of media is essential in ecopedagogy (Kahn, 2010; Misiaszek, 2012). Due to this chapter's limited space, I will narrow discussions of this topic to the Internet and specifically how it has been the pedagogical tool of intensifying post-truthism today, as well as essential in disrupting false truths.

Utilizing false truths to publicly justify socio-environmental oppressions is not new; however, how the Internet to spreads false/truthful information is unique. For example, the single goal of social media to get users to keep scrolling down, no matter posts' truthfulness or falseness, encourages systematic targeting the specific audience to promote false "alternative facts" to for maximum political gains. Targeting the audience is made exponentially more precise with social media's greatest commodified asset – user data. This can be witnessed by Trump's successful US election in 2016 and the spread of false election fraud against his 2020 campaign loss, global warming denial, and Covid-19 misinformation that has led to deadly consequences. Ecopedagogical reading to identify and disrupt post-truthism that justifies Development, if successful, results in *conscientization* that de-development actually

results for the targeted populations which is often opposite to what is being presented to them online (Misiaszek, 2020a). Trump's (environmental) policies will most hurt his hardline supporters who do not have six more zeros on their personal bank statements. This aligns with Marx's argument on how best to dominate the subaltern is to systematically have them believe they are benefiting from happenings in which they really suffer from most.

Two important aspects should be emphasized here. First is that "disrupting" includes radically reinventing technologies to actively counter anti-environmentalism, including technologies initially created for doing the opposite (Kahn, 2010; Jandrić and Ford, 2022). Second is recognizing the differences between ecopedagogical work that problematizes and deconstructs dominant Truths, as opposed to post-truthism as not "being truth-seeking but rather to fit ideological ends, as well as influencing socio-environmental governance" (Misiaszek, 2020a). Ecopedagogues teach through the aspect that much of our human world as subjectively constructed, especially oppressions which are not fatalistically fixed but transformable. Ecopedagogical overall goals is for worldwide justice and planetary sustainability; however, false truths cannot be utilized to achieve this goal. For example, knowingly exaggerating the effects from an anti-environmental act is not ecopedagogical work even if it might result in students' increased sense of environmentalism's importance. The next and last aspect on this topic will be how post-truthism disrupts critical dialogue and, in turn, critical/ecopedagogical teaching.

Constructive dialectical conflict, which is essential to understand (in)justices through diverse perspectives, epistemologies, experiences, etc. (Gadotti, 1996; Apple, 2004), is impossible without agreed upon truth-seeking foundations. Post-truthism diminishes agreed-upon foundations necessary for critical dialogue to occur (à la Habermas, Foucault, etc.). Dialogue with foundations of false truths is not critical and will only lead false understandings and misguided actions. An environmental example would be trying to discuss global warming without agreeing that rising temperatures are occurring or even that Earth is spherical in shape (i.e., "flat-Earth" conspiracies), making the more "common" argument of being caused by human actions or not impossible to critically discuss.

Conclusion: critical comparing environmental pedagogies

There are two crucial aspects to reemphasize before concluding this chapter on the importance of comparative and international education (CIE) in using and implementing ecopedagogical teaching and research globally. First is that ecopedagogy is both a separate pedagogy and can be groundings/currents of other environmental pedagogies. Second, ecopedagogies are complex and require contextual reinventing, as required for all (environmental) pedagogies if explicitly stated or not (Gadotti, 1996, 2008a). This chapter provides the key groundings in which reinventing the plurality of "being ecopedagogical" emerges from; however, this chapter is far from being all-inclusive. Critical comparative methodologies are necessary to construct:

...effective, action-based environmental pedagogies by deconstructing anti-environmental ones, including those falsely cloaked as being "environmental", and the politics of their existence ... this deconstructing is CIE's most essential roles for identifying and disrupting taught fatalistic ideologies that normalize socio-environmental injustices, planetary unsustainability, and the devaluing of the rest of Earth.

(Misiaszek, 2022).

The adjective *critical* to describe the comparisons being carried out is essential because CIE has a contested terrain in which most comparisons were, and unfortunately too-frequently continues to be, benchmarked by Northern pedagogical practices grounded upon Northern epistemologies (Assié-Lumumba, 2017; Takayama et al., 2017).

Global peace, socio-environmental justice, and planetary sustainability are inherent critical CIE goals (Torres, 2017a). In the larger CIE field, what approaches, models, and epistemological groundings are being utilized in comparing methodologies is essential to deconstruct, as well as the envisioned endpoints (Assié-Lumumba, 2017; Takayama et al., 2017; Shultz, 2019). Critical CIE and ecopedagogies are interdependent as argued below.

(CIE) is essential for constructing effective, action-based environmental pedagogies by deconstructing anti-environmental ones, including those falsely cloaked as being "environmental", and the politics of their existence.

(Misiaszek, 2022).

...[ecopedagogy and] ecopedagogical reading within CIE is essential both within more methodological work by CIE scholars and all learning spaces, coinciding with socio-environmental inseparability ... [r]eading to critically compare what is taught on environmentalism, how it is taught, who decides what is being taught, and the politics ...

(Misiaszek, 2022).

All the critical aspects unpacked and problematized throughout this chapter on ecopedagogy and ecopedagogical literacy are parallel concerns for critical CIE (and *should be* for all of CIE models throughout).

What works or what matters? Contested ideas of girls' education, gender equity and global connection

In 2021, as leaders of the G7 club of the richest and most powerful countries in the world traveled to the UK for a summit meeting, the UK Prime Minister made a speech about girls' education in which he termed interventions to promote girls' schooling:

the silver bullet, this is the magic potion, this is the panacea. This is the universal cure, this is the Swiss Army knife, complete with allen key and screwdriver and everything else that can solve virtually every problem that afflicts humanity.

Prime Minister's Office (2021).

While Boris Johnson's rhetoric is noted for bombastic flourishes, this perception that educating girls will solve all global problems of the world, and, by implication, that becoming educated is girls' special responsibility, has been a prominent theme in pronouncements on girls' education since the 1960s. What is notable about this approach to girls' education is the ways in which this aspiration has been instrumentalized to drive forward particular conceptions of development, and associated ideas about a global order.

This notion that girls' education is "what works" is articulated in many scholarly works and programmes of development agencies, as I outline below. In this article I counterpose this approach to girls' education with a different formulation, linked with feminism, rights, gender equality, intersectionality, critical decolonial perspectives and a view of the global as a terrain formed by historical injustices that must be addressed. I term this contrasting perspective "what matters." I first present the two very different formulations of how girls' education has been understood highlighting some of the different conceptions of gender, education and the global in play. I then go on to develop a third position, which I term, "what connects", and attempt to theorize this looking at associated ideas about gender, institutions and the form of global relationships. The argument I have made (Unterhalter, 2009, 2021) is that the sharp divergence between "what works" and "what matters" is itself problematic. If something matters, like feminism or intersectionality, we need to make it work to transform injustices. If something works, we need to be clear about why, normatively, this approach to working matters. How something works, and whether this is good or just is as important as the efficiency or effectiveness of the ways of working. In developing the position associated with "what connects" I suggest a normatively inflected view of girls' education, intersectionality, and the global as a sphere of shared obligation. In so doing, I highlight some of the analytical, policy and practice issues, that come to the fore.

The mainstream approach to girls' education, articulated in the G7 Declaration on Girls Education of 2021, exemplifies "what works." The Declaration notes:

12 years of safe and quality education for all children, and specifically girls, is one of the most cost-effective and impactful social and economic investments governments and donors can make.

G7 (2021).

The Declaration see girls' education as a particular kind of development intervention and investment, that is "cost effective and impactful" linking the process of education and differently situated people who learn, play, teach, administer, plan, research, or dream with narrowly bounded, precisely formulated inputs. The "what works" approach is associated with particular kinds of programmes which focus on a single intervention, and a narrow menu of research methods, most notably randomized control trials, to identify and evaluate interventions (Duflo et al., 2007; Bannerjee and Duflo, 2019). A particular feature of development assistance associated with "what works" links it to advancing global agendas that do not undermine existing geo political and economic arrangements (Fejorskov, 2022). The methods and form of analysis have been criticized for "piecemeal analysis, ad hoc resort to theory, indifference to history and context, and methodological fundamentalism" in relation to the ways they have tried to understand women's empowerment (Kabeer, 2020). Further critiques by the World Bank economist, Martin Ravillon (2020), note the limitations of the approach to inform policy, given that the preference for RCTs as the single effective method is unclear on a priori grounds, raises ethical objections with regard to who does and does not receive the intervention, and risks distorting the evidence-base informing policymaking, given that an insistence on RCTs generates selection bias in what gets evaluated. With regard to girls'

education, many gaps in evidence to inform policy are noted (Psaki et al., 2021). Many of these do not easily lend themselves to investigation through RCTs.

Despite these kinds of critiques from many directions, the stress on girls' education as a development intervention that "works" abound (Sperling and Winthrop, 2015; Agapitova and Moreno, 2017). In statements, such as the G7 Declaration, what is not noted is that girls are human beings, not development interventions. They may or may not engage in education for a wide range of reasons associated with individual, social, institutional, cultural, health and geo political reasons, and access to school education and enhanced learning outcomes are only one stand in the lives they lead. The dynamics shaping these individual and social processes may align with the social and economic investments of governments and donors, but they may not. For the "what works" perspective the rights, needs, capabilities and demands of girls are less significant than how their education works to serve other goals. Although voices of particular girls who chime well with this agenda, may well be amplified on certain occasions, processes of participation and critical reflection on development initiatives are generally not part of the "what works" menu (Jones et al., 2020; De Haan et al., 2020).

Although the prominence given to "what works" agendas, started to emerge from around 2000, the singling out of girls' education, as a strategy that "works" goes back to the 1960s. Initially claims about the significance of girls' education were linked to population reduction (Hartmann, 1987; Sheikh and Loney, 2018). Considerable research from the 1960s and 1970s, drawing on demographic studies showed that in societies where girls remained in school until 18, delaying their first pregnancy, there was a demographic transition to smaller families, associated with enhanced participation by women in the work force (Caldwell, 1980; Schulz, 2002), although a number of commentators raised questions regarding which way the lines of causality ran, and whether, what was significant about the relationship with education was what was learned, or merely entailed attending a school, or living in the vicinity of a school (Axinn and Barber, 2001; Cruz and Ahmed, 2018). This theme that the education of girls is important, as a form of contraception, has persisted and emerged as fears mounted about the dire outcomes of the climate crisis. In a number of accounts of how to respond to the climate girls' education is portrayed as one of the most effective responses governments can take, because educated women and girls are portrayed as having reduced fertility rates, slowing population growth, limiting green house gas emissions and competition for increasingly scarce resources (Drawdown, 2020; Volsett et al., 2020). Estimates have been made that providing for universal education, and bringing all girls into school, will have the result that the population in 2050 could be smaller by 1.5 billion people than if girls continued to have limited access to education. One estimate is that this "fix" would mean that by 2100 the global population could comprise 5.7 billion fewer people (Lutz et al., 2017). A further study identified a strong positive association between the average number of years' schooling a girl receives in her country and the country's ND-GAIN index, a measure of a country's resilience to climate disasters (Kwaak and Braga, 2017). This study found that for every additional year of schooling for a girl, her country's resilience to climate disasters could be expected to improve by 3.2 points (p. 19).

The focus on girls' early marriage and fertility is one stream of the "what works" framing of the significance of girls' education, but another is to see educated girls as an important source of labor in particular forms of manufacturing and service. In the 1990s, girls' education was identified as the most cost effective and efficient intervention that could be taken to reduce poverty. A classic World Bank publication (King and Hill, 1993), with a Foreword by Lawrence Summers, then Chief Economist at the World Bank, promoted girls' education as *the* best investment to address poverty. Summers had developed his analysis in a World Bank paper, where he noted

underinvestment in girls is not an ineluctable consequence of poverty, nor is it made necessary by any religious or cultural tradition. It is an economic problem that results from a vicious cycle caused by distorted incentives. The expectation that girls will grow to do little other than serve their husbands reduces parent's incentive to invest in their daughter's human capital. Uneducated women then have few alternatives and so the expectation becomes self fulfilling, trapping women in a continuous circle of neglect increasing educational opportunities for girls offers the best prospect for cutting into this vicious cycle. As an economic investment, increased outlays directed at educating girls may well yield the the highest return of all investments available in developing countries considering both private benefits and returns to other family members....Experience suggests that female education programs are relatively inexpensive compared to other development investments and could quickly increase female enrollment ratesMajor initiatives to increase female education have the potential to transform society over time. If a larger fraction of girls had gone to school a generation ago millions of infant deaths each year could have been averted and tens of millions of families could have been healthier and happier.

Summers (1992).

This early formulation of "what works" links girls' education with enhancing human capital, yielding high returns for inexpensive outlays, preventing infant mortality, and enhancing the health of populations. Nowhere does his summary mention how educating girls responds to rights, needs or aspirations of the girls' themselves. They only appear in shadowy form with regard to some generalized form of private benefits.

The focus in the seminal World Bank study (King and Hill, 1993) was on addressing barriers to girls' access to schooling, not on looking at experiences, content, pedagogies, hierarchies, exclusions, or school related gender based violence. In later versions of this concern, the focus would come to be on learning outcomes for girls, and failures with ensuring this some of the reasons for education not delivering the predicted outcomes with regard to ending poverty and promoting economic growth. One of the clearest expressions of this view are in the working papers associated with the RISE (Research on Improving Systems of Education) program. A key distillation of this view in a paper on women's literacy (Kaffenberger and Pritchett, 2021) draws on cross national comparable data sets with information on schooling, assessments of literacy, and life outcomes for 50 countries. The analysis shows women's

education, comprising 6 years of schooling and the acquisition of literacy, is positively associated with reduced fertility and child mortality, increased empowerment (assessed through responses to questions on a DHS survey about family decision making and perceptions of intimate partner assault and violence) and financial practices with regard to women's independent use of money. The analysis established that positive life outcomes, associated with literacy and schooling, was larger than the standard estimates of the gains from schooling alone. The analysis here is more nuanced than that promoted by Summers (1992), because positive outcomes are noted in relation to women themselves, but the implications of these, suggested by Kaffenberger and Pritchett (2021), are for decisions to be taken about education systems and investments in learning outcomes, rather than addressing gender inequalities or building an infrastructure around women's rights.

This idea that girls' education was a kind of injection that could be given against poverty, high infant mortality or failures in economic growth has been prevalent in policy documents of the World Bank for thirty years, as noted by a number of critical commentators (Unterhalter, 1996; Peppin Vaughan, 2010; Stromquist, 2012; Monkman, 2021). This has shaped the programmes of many large donor agencies, associated with governments and the private sector (Unterhalter, 2017; Moeller, 2018; Dejaeghere, 2017). The RISE program (eg. Kaffenberger and Pritchett, 2021) has argued to a shift in focus on increasing girls' learning attainment, and focused outcomes on features of women's lives, but has not gone further to suggest more widely framed visions of development or rights.

This focus on the way in which girls' education was a "tunkey" policy for development came to frame the ways in which development was monitored, as the number of girls' enrolled in schools was seen to signal the extent to which other development aspirations could or could not be realized. In influential frameworks for monitoring and evaluating global development, most notably the MDGs (Millennium Development Goals) adopted by nearly all the government of the world in 2000, indicators for what was termed the global goal of "gender equality and women's empowerment" centered exclusively on gender parity in education, that is girls' enrollment in school as a proportion of boys. (Black and White, 2004; Unterhalter, 2008a; Sen and Mukherjee, 2014).

As global policy attention widened from the rather narrow perspective of the MDGs to a broader framing associated with the SDGs (Sustainable Development Goals), the "what works" framing of girls' education came to be associated with particular large programmes, often involving the private sector in PPPs (public private partnerships), which made claims about the ways in which girls' education worked and supported empowerment (Fennell, 2012; Unterhalter, 2017; Evans and Yuan, 2022). These often rested on very limited evidence, or on studies that showed, that how girls education worked was often highly contingent on the relationships in particular contexts, the policy and practice approaches of governments and how these were enacted, and the complexities of power in households, communities, institutions, and political economies, stretching from the global to the local (Unterhalter et al., 2014; Parkes et al., 2016; Unterhalter and Robinson, 2020; Pankhurst, 2022). Despite this expansive critical literature, and even a clear delineation from within a form of "what works" analysis of areas where there was limited evidence (Psaki et al., 2021, pp. 65–67, 74–75), confident tropes associated with "what works" around girls' education continued to be expressed, and were notable during the COVID 19 pandemic. For example, a 2021 Report of the Global Education Evidence Advisory Panel identifying "Great buys" and "good buys", that is intervention programmes that a team of experts viewed as highly cost-effective, with a strong evidence base to guide initiatives to build back better, drew confident conclusions with regard to girls' education and enhanced learning outcomes, even though, the team acknowledged the evidence base was extremely limited, and in the case of the data on Afghanistan, was about to be overturned by political events:

While some effective access programs target only girls, most of the interventions referenced in this note have impacts for both girls and boys, with some general access interventions proving particularly beneficial for girls (for example, in Afghanistan). Most evaluations of programs that did not specifically target girls have found bigger impacts on girls' access than on boys' (where girls were the disadvantaged gender), and general interventions deliver gains for girls in access and learning that are comparable to gains from girl-targeted interventions. But given that girls' participation rates remain lower than those of boys in 53 developing countries, with particularly large disparities in West Asia and Sub-Saharan Africa, more research is needed on the effectiveness of programs that specifically target girls, especially in areas where girls are far behind boys.

GEEAP (2020).

The "what works" position in girls' education can be understood as primarily a techno-rationalist formulation of scaling up from the effectiveness of the intervention proved in one site, and therefore understood as replicable globally, despite many studies that call this into question either because of differences in context (Gibbs et al., 2021), limited research (Psaki et al., 2021) or, as learned in other sectors, the need to document and track the forms of intervention over decades before conclusions can be drawn (Barrientos, 2018).

Comparison in this formulation of "what works" is a form of governance by numbers (Grek, 2020). Numbers of girls enrolled in school or attaining specific learning outcomes are required to validate other development initiatives, as exemplified in the "Good buys" and "Great buys" briefing paper quoted above. These monitoring frameworks place technical experts, who design the RCTs, or the surveys to collect information on enrollment or attainment, at the center of evaluation. For these technical experts gender is understood unproblematically as a form of social relationship linked with biology. The many personal and political debates concerning gender and forms of social justice are not relevant.

In the literature on "what works" the learning crisis is a key organizing idea. The depiction of "a learning crisis" through which children are enrolled in school, but not attaining set levels, emerged at the same time as the "what works" framework (Pritchett, 2019; Languille, 2014; Unterhalter, 2019a; Sriprakash et al., 2020). Indeed, one framing supports the other as the Kaffenberger

and Pritchett (2021) paper illuminates. Thus, the argument runs, the learning crisis, variously associated with poor teaching, and lack of government accountability to deliver education, is preventing girls from learning at school, and limiting the effectiveness of the “magic potion” associated with girls’ education. It was partly the search for a “what works silver bullet” to make the “silver bullet” of girls’ education effective, in the face of the learning crisis, that drove the thinking behind the “what works” approach to education systems (Psaki et al., 2021).

An issue for the “what works” approach has remained how to make sense of the complexities of context, which have often made it so difficult to replicate an intervention in a different locale to that it was trialled in. While some writers associated with this position acknowledge this concern (Psaki et al., 2021), others metonymically read off particular markers associated with socio-economic status, rural or urban location, or the success or failure of education systems to expand learning outcomes to signal aspects of trying to fit in context (GEEAP, 2020; Kaffenberger and Pritchett, 2021).

This narrow conception of girls’ education has been challenged from many directions. While “what works” rests on linking girls’ education to the way it could achieve objectives beyond education, the contrasting position “what matters” rests on articulating a number of different kinds of visions, and showing how education of women and girls was a central component of the vision and how it would be achieved.

From the 1960s women’s rights activism in the global north and south raised issues of reproductive rights and the ways in which poverty and patriarchy impacted on women’s lives, despite education provision. These themes gained prominence as global women’s networks were built linked to UN sponsored conferences (Antrobus, 2008; Zwingel and Zwingel, 2016). A sharp critique developed of the kind of project Summers was promoting, which Devaki Jain, a feminist activist and analyst, called “the ‘catching-up-with-men’ approach”, noting these “pushed poor women into deeper corners” (Antrobus, 2015; Jain, 2012). In 1983 Jain and colleagues embarked on a collective writing and networking initiative, which generated the DAWN (Development Alternatives of Women for a New Era) manifesto in 1985 (Sen and Grown, 1987). This was as central to the “what matters” paradigm as Summers’ paper was to “what works” and was equally influential, although on a different constituency. For DAWN it was essential that struggles and contributions of poor women in different regions of the world were taken into account in any development policy or practice. Their experiences, insights and struggles to overturn intersecting inequalities were what mattered. The DAWN manifesto noted how what were defined as “women’s issues” by mainstream development policy and practice, linked with macro-economic structures and global crises. The analysis looked at the relationship of gender and class and critiqued existing economic and population control programmes, and approaches, such as the basic needs approach for failing to document or engage with the concerns of poor women, shaped by colonial heritages and resource inequalities. The argument in the DAWN Manifesto noted how a range of systemic crises and reproductive failures shaped the experiences of poor women who confronted continuing struggles to access food, fuel and water, the consequences of national debt and the lack of public service. Many experienced the effects of war, violence and a surge in repressive patriarchal cultures. To challenge and overturn poverty and gender subordination the DAWN manifesto mapped out alternative visions, strategies and methods. The vision they outlined was:

We want a world where the inequality based on class, race and gender is absent from every country and from the relationships between countries.
Sen and Grown (1987, p. 80).

Strategies to undertake this were to be formulated in discussion with women’s movements, and long term strategies to dismantle forms of inequality were to be undertaken together with short term actions to counter contemporary crises. Education appears as a key means to understand and document the forms and effects of inequalities and to mobilize for change. The limitations imposed by illiteracy are noted and the needs for mass education programmes are outlined linked with Freirean consciousness raising (Sen and Grown, 1987, p. 88). Thus what matters is centring the perspectives and experiences of poor women and their concern to transform intersecting inequalities. Education projects are part of this process, and need to be closely connected with this vision.

Other critical positions with regard to “what works” were being formulated by scholars writing about feminisms in different regions, and taking context as key shaper of perspective and analysis, not a background idea. For example, in Africa, the work of a group of writers have come to be grouped together linked by concerns with African feminisms which express ideas about what matters centered on a range of different social and political positions linked with power, powerlessness, and processes of change (Mama, 2011). Nkealah (2016, p. 62) distils African feminist concerns with what matters linked with “indigenous feminist models’ considering an African cultural perspective, an African geo-political location, and an African ideological viewpoint.” Kwachou (2023, forthcoming) notes many different strands in African feminist work on education highlighting language, values, negotiations with men, and a different vision of equity. Here education is a site to realize African feminist visions and practices.

A third perspective on “what matters” starts off not from a particular perspective, as affirmed by DAWN and proponents of African feminisms, but from the assertion of particular normative positions associated with feminism, rights or capabilities. While many of these did not have a specific focus on girls’ education, implications could be distilled from the analysis and linked with a critical perspective on “what works”, generating ideas about what matters. Much of my work on this theme has taken this path. Drawing on Molyneux’s (1984) distinction between practical gender needs and strategic gender interests, I wrote a number of critiques of the World Bank perspectives on girls’ education as an inoculation against poverty, highlighting how concerns with gender equality and a transformation of unjust institutions was occluded (Unterhalter, 1996, 2005a, 2008a; Unterhalter, 2000). In other analyses I noted the significance of women’s rights, including the right to education, and considered how analyses

of women's needs, rights and capabilities could be distinguished and mapped onto different approaches and policies (Unterhalter, 2003a, 2005b, 2005c, 2012). I considered normative work on advancing women's empowerment, and the implications of this for thinking about girls' education (Unterhalter, 2008b, 2013; Unterhalter and North, 2018; Unterhalter, 2019b). In this writing what matters is expressed normatively, and girls' education is one facet of the realization of a particular normative position.

A critical perspective on this version of what matters, notes that feminism is not a single narrative or shaped by a single stream of normative ideas. From this viewpoint, these normative visions are often co-opted by the leadership of powerful states, and become a rallying cry for versions of white saviourism (Zakaria, 2021). Shenila Khoja-Moolji shows how "what works" assumptions and versions of ideas about rights were formulated both by the political leadership of Muslim states and by aid organisations, drawing on a homogenized grouping of Muslim women and girls, oppressed everywhere by religion, tradition, and patriarchy, only able to fulfill their potential if "saved" by modern education. Her book challenges these positions centring women's historical narratives which show them to be "fully human and political subjects" (Khoja-Moolji, 2018, p. 22). Here what matters is not the abstractions of analysis but the lived experiences and actions against injustice, that need to be listened to by researchers or academics with humility, paying attention, not imposing frameworks. (Kadiwal, 2021).

Although there are considerable differences between the articulations of "what matters" I have outlined, there are some common features. In all there is a thinking about education systems linked with transformation of injustice, and affirmation of rights, and connection with the demands of feminist, anti-racist, and climate justice activists. In this analysis girls' education matters because of the way it is woven in *both* with the injustices of racism, colonialism, patriarchy, neoliberalism and climate catastrophe, *and* with strategies to bring about change. Girls education is not a "turnkey" intervention but part of both the problem of many faceted injustices, and a small element of many complex processes to address these. Unlike "what works" which has come to center on one crisis – the learning crisis – the "what matters" paradigm delineates multiple crises – environmental, economic, expanding inequalities, violence, colonial relationships from the past and present. There is no signature research method associated with this work, but many studies of girls' education draw on history, literature, and qualitative sociological and anthropological research. Women's studies has been a key generator of theories and epistemological frames.

In "what works" the notion of the global is remarkably frictionless. Interventions can be scaled up or exported around the world. By contrast from the "what matters" perspective, the global is marked by uneven and unjust power between and within countries and regions, between groups of people, and between historical processes. For all the differences in articulation of "what matters", there is a coalescence of views about the need to change these structures, institutions and relationships which form inequality. However, there is considerable difference with regard to how to do this. In the DAWN perspective, it is the link with feminist women's movements representing poor women that is a central to the vision, the strategy and the method. For writers engaging with African feminisms actions are guided by a historically and culturally located place. When the starting place is a normative frame, actions steer toward its guiding light, while for writers articulating a decolonial feminist position it is critical engagement with positionality, epistemic violence, exclusions and distortion that shapes action.

In what works comparison between countries in implementing girls' education is noted with regard to policies, enrollment or attainment. By contrast in "what matters" comparison appears as an exercise either in ideal theory, drawing out the normative idea – gender equality, women's rights, intersectionality – or as paying attention to the lived reality associated with poor women, place, position or representation.

Much of my writing on girls' education has been from within the "what matters" paradigm, and I remain steeped in its politics and analysis. But, taking a somewhat critical perspective on some of my own work, I have for some years been concerned to work to move the locus of engagement of analysts concerned with "what matters" from a margin, to some of the realms of policy making associated with power. I recognize this is a difficult task, and that acting as an ally requires humility, listening, critical reflection, which are not easy to practise sometimes under pressures to deliver to high standards of academic rigor or framed through a particular genre of policy discourse. There is also an ever present problem of co-option, which has dogged work on women's rights and empowerment (Unterhalter, 2019a,b). In developing the position I have termed "what connects" I have tried to develop a normatively inflected view of girls' education, intersectionality, and the global as a sphere of shared obligation identifying certain key sites of engagement. Here I set out some of the analytic spine of the position I am trying to develop around "what connects" in girls' education and provide one example of trying to put this process of acting as an ally into practice.

The idea of connecting ideas and actions through praxis is mapped explicitly in the DAWN manifesto (Sen and Grown, 1987), and appears in some versions of African feminism, particularly nego-feminism as articulated by Nnaemeka (2004) and in some of the work on feminism and decoloniality (eg. Harcourt, 2016; Okech, 2020). This form of connection is different from the mainstream version of "what works" because it is not the outcome that is important, regardless of the process, but how the outcome realizes the ideal. For example, enrolling all girls in school under a repressive, authoritarian government that maintains high levels of poverty and insecurity, suppresses women's rights to own property, move about freely, or challenge violence, might work to increase learning outcomes, reduce population, and engage women in work, giving them access to financial products, but it would not undo unjust structures or institutions of gender inequality. By contrast, leading a mass literacy campaign amongst girls with material developed by a local feminist movement, raising consciousness about why and how gender injustices were kept in place, and what examples of successful struggles for change in provision of say water, food, and fuel had been, and how these could be sustained, would be an instance of connecting ideas and actions for change.

The position I am terming "what connects" draws on a number of formulations of connection. These include ideas of praxis which I have expanded to draw in reflections on working in comparative education and some theorisations of intersectionality. In recent work I have drawn on analyses formulated by Jagdish Gundera (2000, 2014) to expand an approach I have termed

reflexive comparative education through which I attempt to connect concerns with the local, the national, the global and the trans-local. Gundara, I have written, outlines methods to combine some of the insights from comparative education and education and international development, - methods that are "heterodox and multivalent, translocational, and critical" (Unterhalter, 2020). Gundara's themes and work, I consider express some elements of connection that are highly salient to thinking about girls' education. Gundara draws on history, both his own autobiography, and the history of the layers of colonial education in Kenya where he grew up. He thus highlights a strand that is key in what connects, to understand the implications of past actions, for example how girls' education policies were implemented, and work to change them, if they have been associated with war, violence, and a maintenance of inequalities, drawing on a hope that this can happen. Gundara, I have written (Unterhalter, 2020, p. 18), delineates a form of listening to others' perspectives, asserting and examining universal values, charting a different course to the destructive, often hate-filled paths on offer, challenging the maintenance of boundaries, and drawing on some of the insights of diaspora and exile. Gundara's work expresses "concerns with lived experience, trying to think through and enact the intercultural" alert to visual arts, literature and oral narratives, reading, the global, the national and the local, their interconnections, injustices, and disjunctures (Unterhalter, 2020, p. 18). Gundara's work thus expresses many forms of connection, but in his professional engagement he worked to put these ideas into practice, joining committees, shaping policy. Thus one stream animating the position of "what connects" is connecting to history, to place, to people taking account of all the complexity and drawing on the insights this offers to guide action in research, policy and practice.

A second seam of thinking in "what connects" draws on my engagement with the ideas around intersectionality, itself an expression of connection. Intersectionality is widely used as an analytic tool for institutions and organisations to address inclusion, fairness, and think about equity, and has been used in a number of studies of gender and of education (Collins and Bilge, 2020, pp. 2–3; Anthias, 2013; Harris and Leonardo, 2018; Crimmins, 2019). The term intersectionality is generally associated with the work of Kimberlé Crenshaw (2017) who argued, in the context of the USA, that African American women needed to take account politically and analytically of the ways in which they were subordinated as women, as black women, and as black women workers. The idea of intersectionality has widespread currency in some parts of the world amongst activists, academics and policy communities, although the idea of intersectionality is somewhat fluid, with a number of different interpretations (Collins and Bilge, 2020). Drawing on McCall's (2005) discussion of intersectionality which distinguishes between intra-categorical, inter-categorical, and anti-categorical formulations, a recent paper I co-wrote, commissioned for UNESCO, identifies three forms of intersectionality present in discussions of girls' education (Unterhalter et al., 2020). These entail, firstly, a policy approach that highlights descriptions of overlapping differences within groups defined by gender, which we term descriptive intersectionality, and which is sometimes adopted in the what works perspective. We also identify a second form of intersectionality, which we term institutional and normative intersectionality. This entails undertaking an analysis of the ways that formations of power and powerlessness operate in and through education. A third form of intersectionality, discursive intersectionality we characterize as engaging with discursive critique of the ways ideas of gender and inclusion are formulated in education policy and practice. Institutional and discursive intersectionality are both features of "what matters." The argument we made in the UNESCO background paper was the need to bring together the three forms of intersectionality in analysis. This process I think could be taken forward as a form of practice, linked to ideas about understanding histories, facilitating participation, listening, detailed analysis, critique, attending to experience and voice and thinking about the capability for connection.

The AGEE (Accountability for Gender Equality in Education) project, which I lead, could be seen as an instance of "what connects." AGEE is an innovative project, funded primarily by the UK ESRC (Economic and Social Research Council) and FCDO to develop an indicator framework for gender equality in education through critical participatory discussion at local,¹ national, and international levels. AGEE began as a partnership between researchers at universities in Malawi, South Africa and the UK, working with selected UN agencies, bilateral donors and a range of government and civil society organisations, and is currently expanding the range of projects and partnerships. It is an attempt to link together groups with and without power around a project concerned with gender, rights and capabilities (Unterhalter et al., 2022). In some of the work for the project we have tried to engage with, many of the critical comments about governance by indicators (Grek, 2020). The analysis we have made within the project is that from the perspective of "what connects" and the ideas about articulation (Unterhalter, 2019b; Unterhalter et al., 2022) that it draws on, indicators are important to ensure robust and reliable ways of identifying and evaluating inequalities and their underlying causes in order to build more just and resilient societies. How we do this, however, is not straightforward and presents many conceptual and practical challenges around understanding, accessing and utilizing information. The AGEE Framework for evaluating gender equality in education was launched in 2021 and is designed for use at national and international levels to support diagnostic and evaluative work regarding local and global commitments to equality, social justice and sustainable development. It is intended for use in the following settings:

1. International cross country comparison of gender equality in education using a set number of common indicators across countries; this will underpin steps to develop a composite indicator
2. National dashboards to be used supporting work on gender equality linked to Education Sector Plans or other national accountability processes; indicators for domains in the AGEE Framework will be determined through national consultations and reflections

¹Project reference: ES/P005675/1. AGEE has also received support from UCL Covid Support Scheme, the Department of Education Practice and Society (EPS), UCL, and worked in partnership with UNESCO, UNGEI, ActionAid and GPE on specific projects.

3. Project dashboards to be used drawing on the AGEE Framework for diagnostic, monitoring or evaluation work on projects concerned with girls' education and gender equality in education
4. Dashboards for use with mobile or displaced populations, supporting work with a focus on emergencies, conflict and peacebuilding
5. Dashboards for diagnostic, monitoring or evaluation work in neighbourhoods looking at addressing gender and intersecting inequalities in and through schools, looking at schools and their communities.
6. Dashboards for diagnostic, monitoring or evaluation work on gender in higher education institutions or networks of higher education institutions

Current phases of work entail a participatory process for developing criteria for the cross national comparative indicators, the generation of a shortlist of indicators to use on the cross national dashboard, undertaking participatory processes for developing national dashboards, and work in single institutions on generating customized dashboards. It can be seen that in the practice of the project there is an attempt to move between sites that are global, national and local, connecting insights, and forms of practice.

Conclusion

This article has outlined two major positions on girls' education, development and the global order. The "what works" position which stresses a techno-rationalist view of managing education, a vision of education and development that stresses efficiency rather than any larger concern with addressing poverty, inequality and injustice. This approach does not explicitly seek to change the major injustices and disjunctures in the global order. The questions this brings to the fore are how can girls' education as a global policy idea and practice be steered more toward concern with women's rights, gender equality, and redressing global injustices.

I contrast this "what works" position on girls' education with a position I term "what matters." This position links normative visions for supporting rights, capabilities and attending to the demands of poor women, with girls' education, a participatory and transformational approach to education and development, and an intention to engage with the transformation of global injustices. The questions this raises are whether the policies and visions advocated, link concretely with actions for change.

Building from critiques of "what works" and ideas informed by "what matters" I formulate a third position on girls' education and global policy in terms of "what connects." This position drawing on theories of praxis, the overlap in interpretations of intersectionality and some theorisations of articulation, stresses the importance of normative ideas put into practice and the global as a site of shared obligation to address poverty and intersecting inequalities. This surfaces ideas about who formulates policy and guides practice, and how normative ideas are assessed in very specific local contexts. Girls' education is not a "universal cure", it is an area where different pathways are struggled over and evaluated, and where active processes of engagement are needed to listen to and work with the demands of the poorest and most discriminated against. Supporting rights needs, capabilities, equality and justice all matter, and multiple connections are required to make the politics, policy and practice associated with this work.

Introduction

The expansion of digital media, including platforms, social media, and smartphones, brought a new wave of globalization in the realm of culture and technologies (Jin, 2020). Production, consumption, and distribution of cultural goods have mostly shifted toward the digital domain, with platforms as key players. Education and everyday school practices have not been spared by this trend, both because of an increasing platformization of teaching, learning and managerial practices (van Dijck et al., 2018) and because search engines, apps and platforms are now a significant part of the lives of students and teachers and have a role in defining what counts as knowledge and learning (Livingstone and Sefton-Green, 2016; Alirezabeigi, 2021; Perrotta et al., 2021, among many others).

At the same time, it is important to locate schools within media settings that predate digitalization. In the *longue durée*, schooling practices have always been entangled with media practices that involve print, sound, and other technologies that have shaped the ways in which knowledge is produced and circulates across bodies and spaces (Caruso, 2019; Day Good, 2020). These media were also global: atlases, journals, textbooks, globes, blackboards, desks, radio, and film, were often internationally produced and sold, but they were also picked up by local business and adapted to vernacular practices. Thus, the opposition of the global and the local should be unpacked and problematized. Even if events only happen at the material-local scale, they are always constituted by global flows, be it of seeds, waters, animals or human beings, knowledges, or technologies (Galison, 2016), and what is considered global can also be analyzed as a particular site with longer networks and more powerful mediators (Strathern, 1996).

Digital media, then, are not the first nor the last global media, and the extent to which they are "global" merits further analysis (Burrell, 2012; Srinivasan, 2017). Yet they have introduced some breakthroughs in the production and circulation of knowledge that are having ample effects on educational practices. One main breakthrough was to configure new economies of time, quicker, shorter, more intense, and with a capacity to calibrate or coordinate larger areas of human and non-human activity (Agar, 2006; Crary, 2013). Another significant change was the growing datafication of these activities, which made human sociality increasingly technologically mediated. Datafication allows what van Dijck (2013) has termed as connectivity (the use of data made by tech companies to make recommendations and feed our digital practices), different from connectedness (what users make public). Connective digital media are today deeply enmeshed in our social fabric, and corporate forces are dominant in shaping the meanings not only of what constitutes public issues but also of intimate practices such as friendship and sexuality (van Dijck, 2013; Zuboff, 2019).

Connective, that is, commercialized global digital media also impact on how schools are shaped and situated in other geopolitical spaces, bringing into the classroom global narratives that flow through platforms that set different rules and arenas for participation and for knowledge practices (Williamson and Hogan, 2020; Dussel and Fuentes Cardona, 2021). Nowadays, education and everyday classroom activities are entangled in a corporate media and technology realm dominated by a handful of powerful companies, mostly based in the United States. It is the world of GAFAM, or more recently AMAMA (as Google and Facebook have changed to Alphabet and Meta), in which any exchange throughout digital media is at some point related to Alphabet, Apple, Amazon, Meta, or Microsoft (van Dijck et al., 2018). Education and everyday school practices are part of what has been called platform capitalism (Smieck, 2018) or surveillance capitalism (Zuboff, 2019), either by institutional decisions in the buying or using of digital devices and platforms, or through users' daily digital practices (Selwyn et al., 2022).

In the following pages, we discuss the spread of digital connective media in schools through an analysis of the uses of YouTube for school study in a secondary school in Argentina, which is part of a broader research project described below. While in previous studies we approached digital media mostly as a means for cultural production and participation and were concerned with identity, voice, and community (Dussel and Benasayag, 2019; Winocur and Dussel, 2021), we would like to look at global connective media as part of the shift to consider digital infrastructures and materialities (Plantin et al., 2018; Perrotta et al., 2021). We are interested in

understanding how digital platforms “leave their marks on the knowledge they help us produce” (Gitelman, 2014, p. 74); this is visible in the uses of YouTube for school study, in which algorithmic logics and school pedagogies might offer competitive orderings. We argue that in these practices of study with global connective media students unfold a set of practices that, mostly inadvertently, tends to be regulated by platforms’ protocols and users’ practices rather than by school curriculum or pedagogies.

Throughout the chapter, we aim to identify and describe changing conceptions of school knowledge in a media landscape “swamped with information, much of which we are in no position to assess” (Appadurai, 2020). Knowledge practices seem to be shifting toward data management and connectivity; knowledge is measured no longer with criteria related to their precision and truthfulness toward facts (Poovey, 2017), but according to affective qualities such as smartness, sentience, and efficiency for becoming sticky and viral (Halpern, 2014; Jenkins et al., 2013). We are interested in discussing the kinds of knowledge that are mobilized in students’ and teachers’ engagements with the video platform, and the autonomy they can exercise in relation to algorithmic platforms.

To approach these issues, we start with an analysis of YouTube as a digital connective platform, which is followed by a discussion of its educational uses, as they appear in the literature and in documents issued by Alphabet, its owner. We then present some findings from our research project with secondary school teachers and students in the city of Buenos Aires. Finally, we offer some concluding remarks on what these findings might mean in terms of the knowledge flows and practices configured by global connective media in their intersections with schools.

YouTube as a global connective platform

YouTube is part of a larger ecology of digital connective media but has some specificities that are worth of further analysis. The launch and extremely fast expansion of YouTube changed drastically the access to audiovisual content and distribution. YouTube presented itself originally as a social network for sharing amateur video and its first slogan was “*Your digital video repository*,” later replaced by a more accurate one in relation to the practices taking place in YouTube: “*Broadcast yourself*.”

The platform was only 18 months old when a short amateur video showed YouTube founders, Jawed Karim, Steve Chen, and Chad Hurley, announcing that Google was buying the platform for u\$1.65 billion dollars, turning it into one of the fastest success cases in Internet history and signaling the shift toward video internet, a kind of consumption that would become dominant. By 2020, YouTube have more than 2 billion users, one-third of the total of connected people in the world, and 1 billion hours are seen per day; it should be remembered that this does not include China, due to the resistance of the Chinese government to allow Google to operate in its territory.

Both in terms of quantity and quality, YouTube radically changed the ways of accessing, producing, and sharing video content, not only for amateur videos, but for the whole entertainment and film industries that found in the platform a powerful channel to distribute and control their content (Strangelove, 2010). Without a calendar, schedule, or limits to the times a video can be seen, it marked the end of the dominance of broadcasting and started what philosopher Bernard Stiegler called the carnival of the new screen, in which users have cardinal access to discrete (that is, severed from the flow of broadcasting) content units at their own whim (Stiegler, 2009), and that advanced some sort of business model that led to streaming services. Also, considering that users can decide what and when to access content, viewers’ attention becomes the center of a battle to capture a “time of available brains,” that is, a disposition to pay attention and produce more traceable interactions with the platforms (Stiegler, 2009, p. 44). Consistent with forms of digital citizenship that were turning carnivalesque (Papacharissi, 2010), YouTube promotes new formats and genres such as YouTubers and other influencers that rely on their popularity on the platform, based on the amount and duration of viewing and on social media reactions that are datafied and monetized.

As Snickars and Vonderau (2009) point out, the peculiarity of YouTube is the way in which the platform managed to navigate between community and commerce. If something defines the platform’s identity is that it is part of the industry and part of many communities, which still use it as a venue to upload content and visibilize themselves. The relationship between YouTube and audiovisual industries was initially tense, as corporations saw the platform as an infringement of property rights (van Dijk, 2013), but due to its success YouTube became an ally in promotional campaigns and as another screen in which artists and products wanted to be seen. Thus, even if YouTube was born as a user generated content (UGC) platform, today it is part of the conglomerate of global entertainment platforms in which the distinction between amateur and professional content can be considered irrelevant (Scolari and Fraticelli, 2017).

As a symptom of its success, watching YouTube is now synonymous with watching TV for a large part of the population and the platform is always one of the three most visited websites wherever it operates (Cunningham and Craig, 2020). In that respect, YouTube is one of the winners of the “battle for attention” denounced by Stiegler (2009). This is not by chance; along its history, YouTube adjusted its algorithm to be more effective. The breakthrough came in 2016, when the company set in motion what they called Deep Neural Networks, which made use of data from previous behavior and tailored its recommendations with greater precision (Covington et al., 2016). As it will be shown below, the platform’s recommendations feed is one that students value and use frequently in their school assignments.

In relation to its global reach, Cunningham and Craig (2019) state that YouTube exhibits much greater content, creator, linguistic, and cultural diversity than any other global media titan, maybe because its requirements for uploading content are lower than in platforms where writing is still key and because it has become a privileged venue for media activism (Meikle, 2020). Even when YouTube headquarters are US based, 80% of its traffic comes from other countries (Cunningham and Craig, 2019). Since

2013, YouTube offers the possibility of auto-captioning and translating contents into 14 languages, at least until December 2021. Yet this diversity should not be overstated: the availability of global content is filtered by algorithms that establish priorities and hierarchies, in which commercial interests play a significant role, and ultimately this circulation is determined by data profiles and data traces monopolized by the company, in a process that can be considered as a new colonialism, a data colonialism (Couldry and Mejías, 2019).

Are nation-states still relevant in the corporate media landscape that YouTube has helped to shape? National frontiers and local communities appear less important as youth identities are forged in consumption styles and media fandom across the globe in seemingly more appealing ways than older political or legal constituencies (Rizvi, 2012). Following Castells (2013) and Jin (2020), global media is not freed from the national state, but defined by the global distribution enabled by the existence of digital networks and by the directions of flow of people, culture, and capital. And while the nation state and national interests are still significant actors in some spaces (as the example of China or Iran show), their possibilities of setting guidelines and directions are limited “in a de-territorialized world marked by conflict over internet cables, advanced technologies, and market access” (Moi-sio, 2018, p. 5). Yet perhaps “de-territorial” is not the best way to describe this world, as the practices that define it are concrete and material, such as mining for minerals critical to producing devices, setting offshore factories with cheap labor to assemble them, or producing or consuming content. This hyper-connected world is shaped by asymmetries related to how these global flows are made local and recirculated, and the unequal and uneven power relations of key agents. Also, it is important to note that in youth’s engagements within global media, nations continue to be significant levels “of place and affiliation” (McLeod, 2009, p. 284), and schools may play a role in expanding or shrinking the width and density of knowledge flows, as will be seen below.

YouTube as a knowledge platform: popularity algorithms and the logics of searching

In this section we would like to analyze YouTube as part of broader knowledge infrastructures, both in terms of educational content and of how knowledge is defined and circulates. As said before, YouTube is not the first nor the last educational media. Yet, even if instructional videos were contemporary to the birth of cinema and expanded with domestic video devices (Orgeron et al., 2012), there is no doubt that their availability and consumption grew enormously with the expansion of YouTube. The most popular formats are graphic animations with a voice-over that presents curricular content, like the instructional videos produced and posted by Khan Academy, an online learning provider developed by an NGO yet integrated into a larger commercial distribution circuit in which Google-YouTube are key players (Williamson and Hogan, 2020).

Another popular format are videos uploaded by what in Spanish are called *edutubers*, that is YouTube influencers who teach school content mostly through short videos and who are subjected to the same dynamics of monetization and popularization than other producers (Scolari and Fraticelli, 2017; López Aguilar et al., 2020). Most of them are male, confirming that digital platforms are far from an equal playing field (Noble, 2018; Eubanks, 2018; O’Neil, 2016; Regueira et al., 2020). It is also very likely that the prevalence of male YouTubers might be related to the amount of hate speech female YouTubers receive in comparison to males (Döring and Mohseni, 2020). In Argentina, the most popular YouTube educational videos are in Spanish, but not always locally produced. *EduTubers* from Colombia, Mexico, and Spain share the top positions with content produced by local teachers or TV channels that massively distribute their contents throughout the platform (López Aguilar et al., 2020).

Considered as a knowledge infrastructure, YouTube is not only a venue for displaying educational content created by users but is also becoming a key player in the definition of what counts as education and how knowledge is organized and hierarchized. “Learning” is listed within YouTube’s exploring categories, competing with live videos, videogames, movies, and sports. Under this tab, users can find “how-to” videos and school content videos that include cultural content, marketing courses, or tutorials for the most diverse range of needs. Also, during the COVID-19 pandemic YouTube created a hub for educational content, Learn@home, consisting of recommendation lists of videos with school contents. In these lists, state educational agencies and traditional TV channels were lined up with Khan Academy, TEDx, and amateur creators successfully turned into *edutubers*. Interestingly, research conducted before the pandemic showed that in scientific videos, institutional channels, even run by prestigious research such as the Max Planck Institute in Germany and state research institutes in France, fared worse than YouTube influencers in views, subscribers, and engagement (Donhauser and Beck, 2021; Debove et al., 2021); the mix-up of amateurs and institutions seems to be a good move to capture viewers’ attention, but shifts power and authority to new knowledge figures who are validated by their popularity.

However, what is perhaps YouTube’s most decisive intervention on the infrastructures of knowledge is its algorithm for searching. As part of Alphabet, YouTube shares with Google a searching platform that establishes patterns out of words and produces a list of results hierarchized by its popularity (most visited sites) among other criteria that are opaque due to the proprietary quality of the platform’s algorithm. Word-searching becomes the key to producing knowledge, which appears as morsels of information that can be tagged and indexed. As Appadurai and Morozov state, “searchability has the indirect effect of eliminating the need for reading, cross-referencing, recall, retrieval and memory,” and endows “the digital search with oracle qualities” (Appadurai and Morozov, 2021, p. 3). It seems that humans can access or acquire knowledge without having to appeal to any other intellectual and ethical considerations. This reduction of knowledge to data retrieval and management seems to carry several risks, among them a delegation of knowledge practices to the platforms and the marginalization of alternative epistemologies and ways of knowledge that might not appear in the top 10 results but that could enrich our lives and make our cultures more plural and democratic.

In the last years, researchers have started to analyze how YouTube videos are used in schools. [Moghavvemi et al. \(2018\)](#) and [Zhou et al. \(2020\)](#) state that students assign a positive value to studying with YouTube videos, because they feel they enhance their learning experience with visual aids or because they help them consolidate or sediment their learning. [Gil-Quintana et al. \(2020\)](#), in a quantitative and qualitative study with Italian teenagers which use YouTube videos to study mathematics, found that while YouTubers are more valued than teachers as communicators, most students still prefer to interact with teachers and peers in their learning processes; in their study, students with lower academic grades use YouTube videos more frequently, and have more followers in social media platforms, showing a certain disparity between school capital and social media capital. In Argentina, in 2018 one of us conducted qualitative research on uses of digital devices by university students from public and private institutions in the city of Buenos Aires ([Ferrante and Igarzábal, 2018](#)), and found a frequent use of YouTube for studying, mostly during exams' periods. Students privileged TED talks or short animated videos over conferences or keynotes for understanding social or biological processes but also complex theoretical concepts. They searched with words related to the content they were studying and adding "explanation" as a keyword; the videos were selected with criteria such as popularity and recommendations by the platform. As it will be shown, these steps are practically the same used by secondary school students in their navigation of the platform.

Using YouTube videos for school study: alignments and recalibrations

We would like to briefly present some of the reflections about uses of YouTube in schools that are emerging in an ongoing research project on digital inequalities in schools (RED, see acknowledgments). We conducted our research in a private secondary school located in the City of Buenos Aires that receives middle and high-income students; we were planning to conduct research in low-income schools, but it was interrupted due to the pandemic and will be resumed in 2022. Secondary schooling lasts 5 or 6 years in Argentina; in the city of Buenos Aires, the duration is 5 years and we focused on the 3rd (middle) and 5th (last) year of schooling, which generally include students of 15–18 years of age.

Through online surveys and on-site interviews, we looked at how teachers (3) and students (69) use YouTube for school purposes and inquired about their search criteria, video valuation, and other critical aspects in this use. The teachers taught Introduction to social sciences (3rd year) and Social research projects (5th year), and frequently used digital media in their teaching. The students were 15–18 years old, and 34 were female, 31 male, and 4 non-binary or preferred not to tell; 63 students owned a smartphone and 61 had a computer or laptop for their exclusive use.

The school was founded in 1988 by a group of progressive educators and is focused on arts and communication. Its pedagogies lean toward social constructivism and critical thinking, and the curriculum is flexible and open to responding to students' interests and needs. All teachers are university graduates, with degrees in science, humanities, or social sciences, and some of them are pursuing or have finished graduate studies. All classrooms have Internet connectivity and are equipped with screens and projectors; students bring their cellphones and most have laptops at home. As per reported in the interviews, most teachers use audiovisual materials in their presentations, including films, and ask students to make digital productions as school assignments. Considering its material and human resources, this school seems to be in a good position to exercise some autonomy in relation to what is promoted by algorithmic platforms. However, as it will be argued, this has proven to be more difficult than expected.

Students' uses of YouTube: the quest for "fixating knowledge in one's mind" and "getting it right"

Unsurprisingly, students reported a massive use of YouTube: only one in 69 responses said they (gender unknown) doesn't use YouTube at all, and most use it more than once a day in their mobile phones. They tend to watch YouTubers and music videos; less than half reported watching funny videos, videogames or video gamers, tutorials and sports or series recaps. Other frequent but less popular choices are Japanese anime, films, conferences, documentaries, and TV shows.

When they watch for leisure, students said that they do not perform any search but rely on what the platform offers in their personalized profiles; they also watch videos that are shared by friends or that just "pop" into their mobiles, analogous with what [Boczkowski et al. \(2018\)](#) describe as incidental news consumption. This describes how the logic of algorithm operates: searching is not necessary because the platform "knows" what one likes to see, value and share. Students said that they like the recommendations made by the algorithm as they save them time; they considered it good that the platform anticipates their interests and see no harm in it.

However, when using YouTube for studying, students report that they do search, using the words that are related to the content they need to study plus the word "explanation:" this word seems to be good to find educational videos, a thread that will be followed later. Among the results, students reported to choose videos according to the "usefulness" of its content for acquiring knowledge or improving test scores, but they also stick to what appears in the first five options or look for popular videos with many likes, which give primacy to the hierarchies set by the knowledge infrastructure of the platform. Only 9 students said they consider the source or the author of the video as a criterion to select it.

Duration of the videos is another key issue for selecting what to see for studying. In the survey, most students said that they watch videos that last between 5 and 10 min; only 7 students watch videos of 30 min or more. Most students reported that they value videos whose narrative is precise and gets "straight to the point." In the interviews, students related the short duration of videos

with their ability to summarize content, and said that if faced with longer videos, they use the forwarding key to find the content they are looking for. Few students mentioned rewinding and watching videos again for further or better understanding; as Appadurai (2020) remarks, users do not value cross-referencing or further readings.

In relation to their genre, the most popular videos for studying are *edutubers*, animations, presentations, and to a lesser extent video lessons and documentaries. While students mentioned *edutubers*, they were not able to refer to their names, in a similar line than what Gil-Quintana et al. (2020) found in Italian teenagers. The only exception was an *edutuber* called #JULIOPROFE, a Colombian teacher turned entrepreneur with more than 4.72 million followers who publishes short and unsophisticated videos, usually lasting no more than 5 min, that include curricular content for mathematics and physics. In the interviews, students referred to “YouTube videos,” irrespective of who produced them; the platform becomes a kind of authorial voice that blurs their qualities and specific traits (Doueiri, 2010). Asked again about naming specific YouTubers or sources, students mentioned English and Spanish channels and a Mexican math *edutuber*; students could not identify any Argentinean channel or *edutuber* as useful for studying, although their teachers frequently share videos from local sources. Their references seem to come from the platform itself and from the global flow of materials organized by its algorithms; national boundaries do not seem to organize their virtual libraries.

Once they select videos, how do students judge their value for school study? 61 students considered that a good video is the one that “explains well,” again referring to explanation as a pedagogical ideal; they also valued that the video is directly related to what teachers said in class and privileged its ability to summarize content. The videos that they find the most useful are the ones that help them “fixate” concepts, ideas, or processes in their minds and eventually help them get better test scores.

In these students’ knowledge practices, YouTube educational videos do not seem to bring in constructive pedagogies or arouse curiosity, even though the school’s ethos and curriculum promotes these ideals. On the contrary: these videos are brought for specific uses that are related to improving their academic performance and are mostly used when studying for tests. The relationship to knowledge that these assumptions carry is one in which knowledge is a pre-defined entity, a finished and stable product that is out there and that is imprinted on the mind. Once it is imprinted, it stays there, thus the metaphor of fixating (Charlot, 2007). In their video preferences, students seem to reproduce what Jacques Rancière calls as “explicative order,” in which learners, deemed unable to find it for themselves, are given an explanation “for comprehension to take place.” In this relationship, “the words of the master must shatter the silence of the taught material” (1991, p. 4), closing any chance that students raise questions and compare the answers for themselves. For Rancière, the explicative order always reinstates the distance between teacher and student and is an order of *enforced stultification* (p. 5).

What emerges in the survey and interviews are practices that are aligned with the platform’s algorithms: preferences for influencers, short duration, popularity as judged by viewers and likes, and transnational media content. It is noteworthy that these knowledge practices are not the ones that are prevalent in this school, at least as seen and heard in interviews and classes; students seem to evoke and reenact prior study practices that consider knowledge as a finished, highly stable product that must be imprinted or inserted in their minds -the “explicative order” denounced by Rancière (1991). In that respect, YouTube videos contribute to reinforce this conception of knowledge and provide a shortcut that make their study practices more time-efficient (“get to the point”), but not necessarily richer or denser.

Teachers’ uses of YouTube: the uphill battle for attention and knowledge

In this school, teachers frequently use videos in their classes to illustrate content and provide other sources for curriculum work. Among the genres, they bring movies (complete or fragments), documentary style TV shows (mostly produced by the Argentinean public cultural channel *Encuentro*), TED talks and, to a lesser extent, animated short videos. The use of videos grew exponentially during the pandemic, as teachers had to teach online and in hybrid classrooms; they used the school’s learning platform to distribute content but also shared links to YouTube when available. This selection of videos was cherished by students, who said that these are good choices because “teachers know best,” “they search better” and “are more trustworthy.” Students also valued that these videos were directly connected to the lesson plan and the required readings; they saw them as consistent with the curriculum. However, they recognized that the videos selected by their teachers never pop up or appear in their own searches, as they are not popular, and these videos are not the ones they use for revising or “fixating” knowledge.

Teachers said that they are aware that students use YouTube videos for studying and that duration and popularity are the main criteria at play in their selection, whose shortcomings they recognize. In relation to duration, teachers shared with students the unwritten imperative that a video must be short to be good and capture students’ attention. Videos are, for them, conveyors of information; they don’t discuss their style or genres or promote visual literacy. Teachers reported that they feel the pressure to produce or share only short videos, because they wanted to promote students’ engagement and “avoid boredom.”

In this sense, teachers are also engulfed by an economy of attention that is characterized by fragmentation, and in which speed is much more valued than depth (Crary, 2013). These short videos were used for starting a lesson or triggering a discussion, but teachers recognized that subjects cannot be taught in a few minutes and that the videos need to be integrated into larger sequences. Moreover, they considered that their short duration can play against a better understanding of complex phenomena; as one teacher said: “you cannot explain the Spanish Civil War in 10 min, you just can’t.”

Even more than duration, teachers are mostly concerned about media content that might be inappropriate or ideologically questionable, such as racism or sexism. Aware of these problems, the school promotes projects to foster critical digital literacies. However, one teacher narrated an activity that she had designed to improve critical research skills, which was turned upside down by her students:

Gender is a key issue for students, so I asked them to bring to the classroom sexist memes that they found in social media, expecting them to do some research in their own profiles and decide which images were offensive. Instead, they went to Google and typed the words “meme” and “machismo,” and brought the first images provided by the search engine. They did not think why those images were sexist, they just googled and copied the results (Female teacher, Social Research projects).

These practices show the extent to which students delegate decisions to algorithms: the critical gaze is defined by the very platform the activity was supposed to challenge. Certainly, students might have good reasons not to share with their teacher what goes on in their social media profiles, but teachers find it difficult to interrupt this delegation of knowledge and affirm projects in which students are more reflective of their media uses.

Reenacting a position that was already prevalent in critical media literacy, teachers assume a critical ideological stance toward digital media, but it is only recently that they have started to promote further reflections on the architecture of knowledge and the effects of popularity algorithms, and particularly on what Google and YouTube offers them based on their previous searches. Issues around datafication are starting to figure prominently in their lessons. One teacher highlighted that he tries to teach students how to work with sources, design research, and go beyond the first results they find in Google; however, he was not optimistic: *“I always have the feeling that I can’t struggle against this, it’s just too big.”* The image of the uphill battle emerged consistently in the interviews with teachers, and it is probably an accurate metaphor for the difficulties individual teachers are facing when confronted to the knowledge practices that connective global media are promoting.

Concluding remarks

There is no doubt that global connective media are becoming relevant actors in education, providing not just a virtual library in which to find educational content or apps to provide tailor-made support, but also datafying practices and shaping what counts as knowledge in schools and elsewhere. In our research on uses of YouTube for school study, it was clear that the algorithms for searching contribute to morselizing knowledge into parcels that must be “found,” conceived as complete and discrete chunks that provide finished and stable knowledge. Videos are valued because they are short and get to the point, and because they were liked and viewed by other users. Through its algorithm, YouTube privileges affective engagement and quick interactions; it confirms the shift from valuing critical distance, reflection, and argumentation as knowledge practices in favor of immediate emotional adhesion and automated responses to manage content (van Dijck, 2013; Poovey, 2017; Appadurai and Morozov, 2021).

The school in which we did our research tries to mobilize progressive pedagogies to overcome the traditional “explicative order” and counterbalance digital platforms, but teachers feel like Sisyphus, carrying a stone deemed to fall on themselves. Students search for short videos that provide explanations; while they value what their teachers offer, they use other criteria in their autonomous searches, following the first videos on the list or the comments made by other viewers. Videos are not criticized or studied as texts; both for teachers and students, they appear as conveyors of information. Interestingly, students prefer to watch *edutubers*, whose videos are not highly produced but that “get to the point” that the curriculum demands. Their choices are more aligned with the “explicative order” of traditional schooling, now amplified by global connective media, than with their own progressive school, which values inquiry, research, and creation.

More research should be done on whether different teaching strategies would lead to other results. It is not surprising that, even within progressive pedagogies, students remain concerned about tests, which continue to be a pivotal center of institutionalized schooling. But it is also important to acknowledge that there is always a tension in emancipatory pedagogies that try to move away from the “explicative order” denounced by Rancière (1991) and still seek to provide some ordering or cultural hierarchy that risks reinstating an explicative order (Bingham and Biesta, 2010). These debates and quandaries should be brought to the fore in critical digital pedagogies to open up more questions and research projects on what these pedagogies are achieving.

Also, there are methodological limitations in our own approach. It is possible that students learn more than they claim from their teachers, and that they are able to use critical skills and strategies learned in school in other contexts; algorithm learning might not be as powerful as it seems if a different angle is taken. However, the difficulties voiced by these teachers should be taken seriously. As Lisa Gitelman says, “search engines and platforms [are] helping to change how we know and what we know” (2014, p. 80), and while datafication is celebrated by some because it makes life easier, its epistemic and political costs remain opaque and are not present on the public agenda.

The final point we would like to make is related to this opaqueness. Students and teachers did not refer to public policies or to public discussions; these issues seem to be confined to teachers’ individual orientations and resources, and to students’ personal tastes and convenience. Users’ practices are following the protocols of global connective media, and school pedagogies, even when they are willing to, are not powerful enough to recalibrate them toward other goals and practices that might uncouple these

practices from the platforms' business models and reorient them toward the common good (Appadurai and Morozov, 2021). Teachers and students alone cannot solve this; unless these trends and challenges are turned into public issues and are taken by larger constituencies such as universities and curriculum makers, this will continue to be an uphill battle.

Acknowledgment

This research was possible thanks to the generous support of Rijksbanken Jubileum Fond, which funds the project RED (Reconfigurations of Educational (In)Equalities in a Digital World) (GI19-1500), on which we are inscribed. We are grateful to our colleagues for the continuous conversations and discussions on digital media, schools, and inequalities. We also want to thank Benito Castro Pérez, who is conducting a similar study in Mexican schools and helped us refine our arguments.

Glossary

- Brain circulation** The propagation of skills and knowledge through the migration of skilled individuals
- Brain drain** The loss of human capital through emigration
- Brain gain** The gain in human capital through immigration
- Diaspora strategies** Policies and programs adopted by the country of origin to engage with and mobilize exterritorial citizens and emigrants
- Human capital** The skills and resources that an individual or the collective labor force possesses, that has contributive economic value
- Knowledge economy** An economic mode of production centered on information, skills, and know-how as opposed to capital or labor. It is fueled by innovation, research, and technological advancements
- Labor market test** A government requirement where the employer must show that no resident labor is available for the position, in order to justify the need to recruit skilled immigrant labor
- Migration industry** An assemblage of middlemen actors that are driven by their commercial interests in the facilitation and management of migration
- Skilled migrants** Individual migrants who possess the educational and training qualifications, work experiences, and other conditions of immigration set by the host country
- Skills shortage list or skilled occupation list** A list of skills or skilled occupations (that have been identified by the host country as essential, critical, or desirable), used for the selection of skilled immigrants
- Talents** High performing individuals who possess the skills and abilities that are desired by the employing institution, sector, and/or country

Introduction

Countries around the world are increasingly competing for skilled human capital. This global competition over skills or “global race for talent” (Shachar, 2006; Shachar and Hirschl, 2013) have been pursued through policies and programs in the areas of migration as well as education and training. On the one hand, migration policies and programs target skilled immigrants, skilled diasporas, and returnees. On the other hand, education and training policies and programs target nationals and international students turned skilled migrants. Regardless of the specific target groups, the fundamental aims of such policies and programs are consistently similar: to attract, retain and produce skilled human capital that are necessary to sustain the country’s economic growth and global economic competitiveness.

This article provides a critical review of the rationale, strategies and consequences of the global competition over skills. First, it outlines the key global developments and debates that contextualize countries’ competition for skilled human capital. Second, it reviews policies and programs that focus on the attraction and retention of skilled human capital. This includes skilled migration policies, as well as diaspora strategies and return migration policies. Third, it reviews policies and programs that focus on the production of skilled human capital. This includes technical and vocational education training (TVET) programs, and higher education student immigration policies (including post-study work visas). Fourth, it discusses emergent research agendas, including debates around how “skills” and “talent” are defined, the emergence of the migration industry that facilitates and shapes skills mobility, and the impact of the COVID-19 pandemic on the global competition for skills.

In this article, the term “migration” is used in reference to all types of migration flows, including immigration and emigration. The term “immigration” is used in specific reference to inward migration to host countries, while “emigration” is used in specific reference to outward migration from sending countries. The term “skilled migration policies” encompasses policies that attract and encourage immigration, circular migration, and return migration of skilled individuals. The term “skilled immigration policies” refer specifically to policies concerning the inward mobility of skilled individuals to the host country.

Key global developments and debates

The debates on the migration of skilled human capital started emerging in the mid-1960s following the large scale emigration of British scientists and engineers to Canada and the USA in the 1950s–60s (Jöns and Cranston, 2020). Then, the focus was on brain drain, where the en masse emigration of skilled individuals was seen as the irreversible loss of human capital from the origin to the destination country. During the 1970s–90s, academic debates focused on brain drain from developing countries to developed countries, especially in certain skill intensive professional sectors such as the medicine, nursing, science, and engineering (e.g., Portes, 1976; Joyce and Hunt, 1982). The term brain drain thus became associated with the permanent loss of scientific human capital, with negative economic development effects for the origin countries that are primarily developing countries in the Global South.

It was not until the 1990s that the issue of skilled migration started to be framed as the *global* competition over skills—that is, it is no longer seen as a sole problem of one-directional brain drain from developing countries. This development has been largely a response to broader trends including economic globalization, the development of the knowledge economy, and the rise and expansion of multidirectional international migration flows that are no longer confined to South–North flows. Under the broader context of economic globalization, there has been increased integration of national economies into the global economy. Alongside this, the emergence and expansion of the knowledge economy saw the turn toward intangible skills, knowledge, know-how, and technological innovations as means of production rather than generic (unskilled or less-skilled) labor force and tangible raw materials. The knowledge economy germinated in developed countries, but has rapidly expanded to middle-income developing countries that are seeking to gain competitive footholds in the global economy. This development has, to some extent, encouraged reverse brain drain flows to such developing countries, thereby constituting a loss for the developed countries that were hosting those skilled individuals (Ong et al., 1992).

As part of economic globalization and the rise of the knowledge economy, multinational corporations (MNCs) and transnational corporations (TNCs) are locating their headquarters and other functional offices in cities and countries where they have access to the necessary skilled human resources for their operations. These include locations in the Global South where wages and operating costs are comparatively lower. The geographical spread in the sites of employment that are linked to the global knowledge economy further stimulated multidirectional international migration flows. Such migration flows could be produced and managed internally within the corporation (e.g., through intra-company transfers), or stimulated through external hiring. For example, Koser and Salt (1997: 286) noted that TNCs, through their internal and external labor markets, employ their necessary skilled manpower

and deploy them to any of their sites worldwide. Moreover, skilled manpower that have originally migrated internally within a corporation could become subsequently available to other employers locally and globally (Findlay et al., 1996). Hence, the skilled labor demands of MNCs and TNCs in turn stimulate multidirectional international migration flows of skilled manpower.

The push toward the development of skills for countries' economic competitiveness has also been actively promoted by international and regional organizations such as the Asian Development Bank (ADB), the International Labor Organization (ILO), the Organization for Economic Co-operation and Development (OECD), and the World Bank (e.g., ADB, 2007; ADBI et al., 2014; Dundar et al., 2014; Lall, 1999). In a working paper for the OECD, Salt (1997) argued that a highly selective skilled migration regime that effectively manages inflows and outflows of skilled migrants is essential for a country's economic development. This emphasis on the link between the mobility of skilled migrants and global competitiveness is further promoted in an OECD report published a decade later (OECD, 2008). Nevertheless, a key developmentalist stance underwire much of international and regional organizations' advice regarding the importance of skills for countries' economic development. For example, a common trope is that "[t]he immigration policies of developed countries should facilitate movement; yet, they should incorporate mechanisms that encourage developing country economic growth" (Lowell and Findlay, 2002: 2) such as encouraging return migration through the temporary skilled worker visas to prevent brain drain from the origin developing countries.

In contrast to the debates on the detrimental impacts of brain drain to developing countries prior to the 1990s, after the turn of the century the migration of skilled individuals was no longer seen as a one-off occurrence that entailed an absolute gain or loss on the part of the receiving or sending country. Docquier (2014), for example, argued that some level of skilled emigration can generate positive feedback for sending countries (e.g., through remittances, circular migration, the presence of diasporas in destination countries)—although the extent to which this is possible is largely country specific. Indeed, with the emergence of concepts such as brain circulation and brain exchange, scholars, policymakers and international organizations have argued that skilled individuals can contribute to the development of their origin countries remotely, or through occasional return visits (Agunias and Newland, 2012; Saxenian, 2005). Such a perspective informed the development of diaspora strategies or diaspora engagement policies, where the governments of origin countries introduce policies to actively engage with their emigrant skilled populations for skills development and skills transfers (de Haas, 2006; Kuznetsov, 2006a; Wescott and Brinkerhoff, 2006). While return migration (also conceptualized as reverse brain drain) constitutes one of such diaspora strategies, the fundamental aim is to encourage the circulation of skills, knowledge exchange, and technological transfers rather than corporeal mobility per se.

The turn of the century has also witnessed the development of annual indices and rankings that chart the global economic competitiveness of countries and cities in talent attraction. For example, the Global Talent Competitive Index (GTCI), produced by INSEAD (a renowned global graduate-only business school) since 2013, is an annual benchmarking index of 125 countries (INSEAD, 2020). The GTCI is produced based on an analysis of input factors (talent enablers, attraction, growth, retention) and output factors (vocational and global knowledge skills) in each indexed country. Another annual index is the IMD World Talent Ranking, produced by the Institute for Management Development (IMD) World Competitiveness Center (a research center under a global business school based in Switzerland and Singapore) since 2014 (IMD, 2020). This index measures three main factors: (1) the investment in the development of resident talent; (2) the extent to which a country appeals to skilled migrants; and (3) the availability and readiness of skills in the country's talent pool. The existence of these indices and rankings further reinforce and legitimize the global competition over skills. Although developed countries in the Global North still dominate the top positions in such lists, (sector-specific) talent hubs in developing and periphery countries in Asia and the Middle East (Ewers, 2017; Ewers et al., 2021; Ortega et al., 2020) have started to emerge as "rising stars in the global race for skill" (Cerna and Czaika, 2021).

On the one hand, the global competition for skills has been produced in response to national, regional, and global demands for skilled human capital which may not be readily available locally. On the other hand, the increase in the number and proportion of educated populations has also meant that more individuals are aspiring for work and life opportunities that may not be available in their countries of origin. As a result of both these demand and supply factors, a "global skills market" has emerged (Czaika, 2018: 3–7).

The attraction and retention of skills through selective migration policies

As a result of the broader trends and developments outlined earlier, countries are increasingly competing with each other in attracting and retaining their skilled workforce. The global competition for skills is aptly captured in Kapur and McHale's (2005) book title: "Give us your best and brightest". In the book, the authors suggested that countries enter into this global competition by increasing the focus on skills in their immigration policies. And indeed, since the 2000s increasing numbers of developed and developing countries have designed and implemented selective skilled immigration policies (Czaika, 2018: 1). To be sure, *attracting and retaining* skilled human capital in the country's labor force through immigration is often a more economically efficient manner to boost productivity and generate growth. This is in relative comparison to strategies aimed at *producing* skilled human capital through education and training, which often require investments over a longer timeframe before the outputs can be reaped. Moreover, the investments into education and training, undertaken by the origin country, may eventually lead to the loss of the trained human capital through emigration to the destination country (i.e., brain drain).

The migration based strategies undertaken by countries to attract and retain skilled human capital can be broadly categorized into three areas of focus, each targeting a specific group of skilled migrants. First, with regards to readily available skills, countries typically utilize skilled migration policies targeted at importing sector-specific skilled migrant labor. Second, with regards to the

transfer of knowledge, skills and networks, sending countries could utilize diaspora engagement policies targeted at their emigrant and diaspora populations. Finally, with regards to skilled human capital in-the-making, countries could turn to student immigration policies (including post-study work visas) that target student turned skilled migrants. The last group will be discussed in the next section, on the production of skills through education and training.

Skilled immigration policies

It has been pointed out that there is often ambiguity between “skilled” and “highly-skilled” migration in academic and policy discussions (Parsons et al., 2020; Weinar and Klekowski von Koppenfels, 2020). For example, in a working paper discussing the conceptualization of highly-skilled migration, Parsons et al. (2014) highlighted that there are three discordances that complicate any neat and objective definition of this type of migration. In particular, they highlighted that there is firstly a “definitional discordance” where an individual’s status as a highly-skilled migrant is dependent on the destination country’s definition; secondly an “occupational discordance” as countries may have competing occupational categorizations that may not be directly comparable, thus affecting the individual’s classification as highly-skilled or otherwise; and thirdly a “policy discordance” due to the intrinsic contradictions in the country’s treatment of a specific group across different sets of policies (Parsons et al., 2014: 4–5). In sum, how skilled and highly-skilled migrants are being defined through policy terms are highly dependent on changing national priorities as well as global politico-economic dynamics.

As “skill” may be difficult to define and objectively measured, countries often use indicators as proxies of selection in their skilled immigration policies. Commonly used proxies include an individual’s highest level of educational or technical qualification, occupational classification, or minimum salary (Czaika, 2018; Parsons et al., 2014). With regards to assessing potential migrants’ qualifications and experiences, host countries may look to internationally recognized formal education and training. With regards to occupational classification, host countries may establish and maintain their own national classification systems, such as skills shortage lists, skilled occupation lists, and priority employment sectors. Additionally, some destination countries may require labor market tests to ensure that employment of skilled migrants do not reduce the employability of local residents. The key characteristic of such selection instruments is that they can be tweaked and modified to suit the destination country’s changing labor market needs.

Skilled and highly-skilled immigration policies can be generally categorized into three broad policy categories: (1) skill-selective admission policies; (2) post-entry policy instruments; and (3) bilateral labor agreements (Czaika and Parsons, 2017: 610; Table 1). Each policy category has its own function and rationale. Briefly, the first category filters and selects for skilled human capital for immigration entry, while the second and third categories contribute toward the attractiveness of the host country for skilled migrants in the short, medium and long term. Given the increasing competition for skills, it is perhaps the second and third categories that constitute the determinative factors to the attraction and retention of skilled human capital. Indeed, Papademetriou et al. (2008) have suggested that skilled and highly-skilled migrants consider a country’s “total immigration package” (i.e., the sum total of the country’s immigration regulations and conditions) when making migration decisions. For example, potential skilled migrants

Table 1 Categories of skilled and highly-skilled immigration policies.

<i>Skill-selective admission policies</i>	<i>Post-entry policy instruments</i>	<i>Bilateral labor agreements</i>
Points-based system (PBS): selects potential skilled migrants for entry using a scoring system where points are allocated to a set of factors (e.g., education level, language fluency, existing job offer, connection with the host country, age, occupational sector, etc.). Used in Australia, Canada, the UK, and the USA. Skills shortage list: potential skilled migrants who are qualified to work or train in an occupation in the list are eligible for entry through this immigration route. The host country may maintain different lists (e.g., temporary/long-term list, regional list, employer nominated list). Used in Australia and New Zealand. Labor market test: mechanism that ensures that skilled migrants are only admitted after employers have demonstrated their unsuccessful recruitment of national workers. Used in most of the European Union member states.	Access to permanency rights: possibilities for skilled migrants (and their family members or dependents) to access rights to permanent settlement in the host country. This includes permanent residence, citizenship, spousal work rights, children’s education, family reunification, etc. Financial incentives: special financial arrangements for skilled migrants, such as tax exemptions, tax breaks, preferential tax rates, allowances, etc.	Mutual recognition of qualifications: regulation of the reciprocal recognition of diplomas and credentials by sending and host countries. Portability of social benefits: regulation of the equal or indiscriminated ability for skilled migrants to retain access rights to social benefits such as pension, healthcare, and other accrued benefits when they move across countries. Double taxation: agreements that prevent the double taxation of income, wealth, property, and inheritances for skilled migrants who may hold multiple residences.

may take into consideration the host country's other immigration and settlement possibilities that implicate they and their family members' future livelihoods and mobilities. As [Bailey and Mulder \(2017\)](#) have pointed out, skilled and highly-skilled migrants' migration decisions must also be contextualized to their lifecourse trajectories, in addition to their evaluations of policies and institutions that support their migration plans and professional development.

Diaspora strategies and return migration policies

While skilled and highly-skilled immigration policies are used to target immigrants, diaspora strategies and return migration policies are used to target skilled emigrants and members of the diaspora. This set of policies and programs are typically used by sending countries with significant numbers of skilled emigrants and diasporas, and that may not be as competitive as other host countries in attracting skilled immigrants. This is especially the case for developing, middle-income and upper middle-income countries with skilled emigrants and diasporas in the STEM (Science, Technology, Engineering, and Mathematics) fields. As mentioned earlier, diaspora strategies include those that encourage permanent, temporary or circular returns, as well as those that facilitate offshore knowledge exchange and other contributions.

Like skilled immigration policies, there is "no 'one size fits all' policy [through] which countries attract talent" ([Cerna and Czaika, 2021: 18](#)). It therefore follows that diaspora strategies must be designed to suit to each specific context. [Kuznetsov \(2006b: 233–236\)](#) has suggested that the degree to which sending countries are able to engage with and mobilize their diasporas in the global competition for skills is dependent on the interactions between two factors: (1) country conditions; and (2) the size and sophistication of the skilled diaspora. For example, diaspora skills and knowledge transfers may be hampered by the lack of a robust investment and innovation ecosystem in a sending country, even with the presence of a relatively large, mature, and well organized diaspora with the desire to assist in the country's skills development. Hence, the type of diaspora strategies and return migration policies must be appropriately designed and implemented to suit each country's peculiarities.

East Asian and Middle Eastern industrializing countries such as China, South Korea, and Israel have been most prominent in their use of diaspora strategies and return migration policies targeting skilled emigrant and diaspora populations ([OECD, 2008: 48–49](#); [Welch and Hao, 2016](#); [Zweig, 2006](#)). Under President Park Chung-Hee's leadership, South Korea implemented systemic reverse brain drain policies during the 1960s–90s, which led to significant repatriation of Korean scientists and engineers from their host countries ([Yoon, 1992](#)). Crucially, South Korea's success in this regard was the result of an organized state-led effort that provided a conducive domestic environment (e.g., research and development institutional development, legal and administrative reform) with conditions that empowered the returnee skilled human capital to pursue their research and innovation (e.g., compensation and benefits, guarantees of research autonomy) ([Yoon, 1992](#)). Similarly, China's return migration policies, such as the Thousand Youth Talents Scheme (TYTS) launched in 2011, have been relatively successful as the schemes have been accompanied by supportive domestic environments for professional development, especially since the turn the 21st century ([Li et al., 2018](#); but see [Zweig and Wang, 2013](#)). Another key factor that contributed to the relative success of China's skilled return migration schemes is the existence of coordination between central and local governments in the implementation of the schemes, from the recruitment of talents to the support provided to them after their return to China ([Li et al., 2019](#)).

In contrast, Israel has adopted an approach that primarily utilized ethnonationalism as a discursive strategy to entice the return of its highly skilled diasporas. As [Cohen \(2009\)](#) has argued, this discursive approach effectively excludes members of the diaspora who do not fit into the state's target population (see also [Koh, 2015](#) on the Malaysian case). Moreover, such an approach may overly focus on invoking ethnonationalism, without due consideration of individual skilled diasporas' personal/professional circumstances and other non-ethnonationalistic decision making factors ([Cohen and Kranz, 2015](#)). Most importantly, unlike the case of South Korea and China explained above, this approach has focused almost exclusively on the act of return while neglecting what comes after the skilled diasporas' return.

The production of skills through education and training

The previous section has discussed the strategies used by countries to attract and retain "ready made" (i.e., already trained) skilled human capital. This section shifts the focus to the strategies used by countries to produce skilled human capital through education and training programs and policies. These include TVET programs aimed at developing domestic human capital, and higher education student migration policies (including post-study work visas) aimed at attracting student migrants as future skilled migrants.

TVET

In a briefing paper for the ADB, [Jagannathan and Geronimo \(2013\)](#) highlighted that TVET programs should be integrated into the skills development strategy for developing countries in the Asia-Pacific. As they argued, the coordinated development of technical and transferable skills that serve interrelated industries can increase the economic efficiency and competitiveness of the industry cluster as a whole. Crucially, skills that are needed by these developing economies include advanced skills that are required for the knowledge economy, as well as medium skills that are required for labor-intensive sectors.

Indeed, there are differences in the level of maturity and sophistication in each country's knowledge economy. Some countries may be more advanced in this area, thereby requiring skilled human capital that possess more advanced and specialist skills and

knowledge. Some countries may be less advanced in its knowledge economy, with some components of the national economy being reliant on labor-intensive production. This means that such countries would need to focus on the development of medium level technical and vocational skills, rather than that of advanced knowledge skills. Regardless of the exact composition of the country's economy and industry sectors, what is important is that the global, regional and national markets are rapidly changing. By extension, labor market needs are also constantly changing. To respond to the changing skills demand in the labor markets, countries would need a robust national education system that include public and private education and training provisions, as well as better integration between skills production and skills utilization (see [Froy et al., 2012](#) for an analysis of the experiences of Italy and the UK; and [Yonezawa and Kosugi, 2006](#) for an analysis of Japan's experience).

Student migrants as future skilled migrants

There are close links between higher education and the production of skilled human capital and their post-qualification labor mobilities. A report on labor migration, skills and student mobility in Asia noted that the facilitation of student mobility is often seen as a key element in the broader promotion of skills development and mobility ([ADB et al., 2014: 15](#)). Indeed, many host countries see student migrants as future skilled migrants ([Ziguras and Law, 2006](#)). This assumption of a more or less linear and predictable transition from higher education to skilled labor has informed the design of post-study skills retention policy instruments such as job search visas (also known as post-study work visas), waiver of labor market tests, bonus points for switching into other visa categories, and facilitated access to permanent residency and citizenship (see [ADB et al., 2014: 23–26](#)).

As [Mosneaga \(2014\)](#) has rightly pointed out, students sit at the intersection between skills production and skills attraction. Classified as “students”, they are seen as in the process of gaining skills; and it is only upon the completion of their education or training that they can attain the status of “skilled migrants”. This clear categorical separation, however, obscures the reality that “students are not only students, and skilled workers are not only workers: the roles change during the time they spend in the host country” ([Eskelä, 2013: 150](#)). Moreover, some studies have found that international student migration becomes a channel for entry into temporary and precarious low-wage or low-skilled jobs in the host country (e.g., [Liu-Farrer, 2009](#); [Robertson, 2016](#)), rather than into the skilled labor market.

Despite the contradictory outcome where international students do not turn into the skilled human capital that the host countries expect them to be, many host countries have designed and implemented post-study skills retention policy instruments, especially during the 2000s to early-2010s. And indeed, the existence of such policy instruments may well be the key attractor for potential international student migrants who are planning ahead for their post-study careers and migration plans. [Baas \(2010\)](#), for example, found that Indian student migrants have chosen Australia as their study destination because of the clear-cut rules for permanent residency application after graduation. This has developed to the extent that the India-Australia student migration route became a “PR factory” (i.e., a factory line production of permanent residents) ([Baas, 2010](#)). Here, again, is an example of the contradictory outcome of a post-study skills retention policy that have been appropriated by different actors for their respective purposes.

This mismatch between expectation and outcome of post-study skills retention policies, as well as shifting government stances on immigration, have led to some host countries reforming their post-study work visas such that these no longer provide an automatic pathway to migration and settlement. In 2013, the Australian government introduced the revised temporary graduate visas (subclass 485) which aimed at decoupling international student immigration from skilled immigration ([Spinks, 2016](#); see also [Tran et al., 2020](#)). Similarly, the UK's post-study work visa was abolished in April 2012 amidst a hostile immigration environment (see [Moskal, 2016: 128–129](#)). In October 2019, the British government announced the revised post-study work visa (i.e., the Graduate route visa), primarily aimed at increasing the number of international students in the UK ([UK Home Office, 2021](#)) rather than retaining graduates in the skilled workforce. These examples suggest that host countries such as Australia and the UK are shifting away from post-study skills retention policies.

Emergent research agendas

Whither “skills” and “talent”

Although there has been a proliferation of policies and programs in the global competition for skills over the past decades, there is nevertheless no universal agreement on the definitions of “skills” and “talent”. Many scholars have pointed out that “skills” and “talent” are illusive concepts that are socially constructed, power laden, and context specific ([Boucher, 2020](#); [Skeldon, 2018](#); e.g., [Williams and Baláz, 2008: 26](#)). As a result, attempts to delineate common categories and typologies of “skills” or “talent” are never sufficiently comprehensive nor easily comparable across different country contexts. For example, [Solimano's \(2008\)](#) six-type talents categories (technical talents; scientists, academics and international students; professionals in the health sector; entrepreneurs and managers; professionals in international organizations; and cultural talents) missed other types of talents (e.g., sports talents) that may be valued by a particular host country (see [Shachar and Hirschl, 2013](#)). More recently, [Cerna and Chou \(2019: 821\)](#) noted that “definitions of talent differ by discipline, organization, policy sector, country, as well as over time”. Afterall, “skills” and “talent” can be turned into rhetorical devices and policy instruments by countries to select and reject individuals on the basis of their changing labor and other needs.

Parsons et al. (2020) have pointed out that “skill” is implicit in skilled immigration policies but not explicitly delineated. On the one hand, the ambiguities surrounding definitions of “skills” and “talent” can translate into downstream implications for policy design, implementation, and evaluation (Cerna and Chou, 2019). On the other hand, a lack of transparency and consistency in the definitions of “skills” and “talent” raises important ethical and political questions for the global competition for skills. These questions include: “Who are the arbitrators of skill? What constitutes skill? And how is skill constructed in the migration process and in turn, how does skill affect the mobility?” (Liu-Farrer et al., 2020: 4, original emphasis). Indeed, skilled migration has never been equally fluid and frictionless for every individual. Recent contributions have highlighted that the gender aspects of skilled migration, including biases in skills definition and recognition, remain under-researched (Boucher, 2021; Dodson, 2021). Gender may also interact with other axes of intersectionalities (e.g., age, race/ethnicity, religion, sexuality) in producing diverse and stratified skilled migration outcomes and experiences (Boucher, 2020; Kofman, 2014).

To this end, Raghuram (2021) has called for attention to the spatio-temporalities of skills, that is, the time and place (including sites and networks) where skills are produced and reproduced. As she persuasively argued, attention to the “politics and ethics of skilling” can shed light on the varied mechanisms and outcomes of the spatialities of skills which “prescribe, produce, have prevailed and precluded some people from skilled mobility” (Raghuram, 2021: 5, my emphasis). According to her, such an approach offers three productive possibilities. Firstly, it enables the analysis to get past the limits of methodological nationalism that have informed the debates on brain drain versus brain gain. Secondly, it enables a shift beyond the national frame, by taking into consideration the structural conditions that have shaped the historical developments of skilled migration and policies in and across specific sites. Finally, it allows for an interrogation of collective responsibility to the inequalities that have been produced and intertwined into skilled migration, beyond attributing those inequalities to individuals’ personal attributes and characteristics. In sum, this approach could offer productive insights to the question of distributive justice underlying the global competition for skills.

The migration industry

The intensified global competition for skills has led to the development of a highly diversified and transnational migration industry that caters to countries’ need to attract, retain, and produce skilled human capital. The migration industry can be understood as “the ensemble of entrepreneurs who, motivated by the pursuit of financial gain, provide a variety of services facilitating human mobility across international borders” (Hernández-León, 2008: 154). In human resource management, companies may outsource their talent search to third party companies with the relevant networks to assist the companies in identifying and recruiting the “right” candidate for the position. Similarly, countries may also outsource their talent search to actors in the migration industry.

There may also be cases where the migration industry has developed as a response to market demands and operates independently without any direct collaboration with the host countries. For example, Baas (2019) has noted the emergence of an education-migration industry as a response to the increasing alignment between policies aimed at attracting international student migrants and policies aimed at attracting skilled migrants. As he explained (Baas, 2019: 224):

... the industry ... can be observed to carefully navigate and negotiate a fine line between supply and demand. ... the industry often appears to operate in an in-between space where on the one hand they can be observed to cater for international students’ demands and expectations of onward migration or even permanent residency, while on the other hand paying careful attention to and making a business out of the nation’s rules and regulations as well as policy adjustments and interventions.

At the same time, Cohen (2021) has also observed the development of a return migration industry as a result of Israel’s focus on enticing the return of its skilled diaspora. Specifically, he observed the proliferation of non-state actors that have emerged to capitalize on delivering a suite of services that are needed by the returning skilled migrants and the Israel state. These include “[t]alent acquisition specialists, [international] tax advisors, real estate brokers” (Cohen, 2021: 4101). Crucially, the return migration industry is involved in two stages of the return skilled migration process: firstly, the recruitment or mobilization phase, where the skilled individual is being enticed to return; and secondly, the reintegration phase, where the skilled individual and the accompanying family members are being provided with assistance in their relocation and resettlement into Israel (e.g., children’s education, housing, tax planning).

The COVID-19 pandemic

Since early 2020, the COVID-19 pandemic has generated worldwide disruptions and changes to the normalcy of human socio-economic life. In order to contain the spread of the virus, countries have imposed border lockdowns and travel restrictions, as well as introduced additional health and quarantine requirements for travelers and migrants. These changes have created a new global mobility environment with significant impacts on the ease and possibilities of human movement and skills mobility. The pandemic has also impacted upon labor market demand and supply, especially in terms of skills shortages in certain sectors and professions. Overall, this global health crisis has led to debates about what are “essential jobs”, who are “essential workers”, and what are “essential mobilities” (see Salazar, 2021). These pandemic generated debates would necessarily shape the positions taken by each sending and destination country in the new landscape of the global competition for skills.

With regards to impacts of the COVID-19 pandemic on labor markets, Gamlen (2020) has noted rising unemployment and looming economic depression in the USA and the European Union. As he suggests, these macroeconomic conditions would lead to a reversal of the decades-long trend of migrant labor dependency in key migrant destination countries. The time lag in labor demand and supply may lead to a situation where “migrants cluster in essential jobs at the high- and low-skill ends of the skill spectrum” (Gamlen, 2020: 3), as well as under employment and skills mismatch of both resident and migrant labor. As anti-immigrant sentiments grow, governments worldwide may turn to more restrictive immigration policies.

The restrictions on migration and human movement during the pandemic has meant that skills mobility and knowledge exchange through previously existing routes have been suspended or disrupted. Importantly, while these restrictions may be temporary or short-term in terms of their duration of implementation, it is likely that they will lead to significant and longer-term implications for the production and circulation of skilled human capital. For example, travel restrictions could stifle scientific careers and limit the growth of global scientific networks (Woolston, 2021). Border closures and fully online teaching in higher education institutions may compel potential international student migrants to reconsider their migration and post-study career plans. Indeed, the increasing availability and acceptance of online and distance learning options are expected to shape international student migration flows in the post-COVID world (Mittelmeier et al., 2021). As international students could be future skilled migrants, changes in international student mobility trends will significantly shape the global skills landscape in the mid- and long-term.

Conclusion

Debates surrounding the global competition for skills has evolved from a focus on brain drain versus brain gain, to brain circulation and exchange, and most recently to the race for talents. On the one hand, countries compete with each other to attract and retain what appears to be scarce human capital resource that is in limited supply. This strategy seeks to address skilled labor demand in the short term, especially in specific sectors. On the other hand, countries implement education and training programs to produce skilled labor supply. This strategy seeks to address skilled labor demand in the medium to long term.

While the global competition for skills has been in existence since the mid-twentieth century, there is thus far no universal and objective agreement on the what constitutes “skills” and who is a “talent”. “Skills” and “talent” are socially constructed notions that are context specific, and that are embedded within the spatio-temporalities of their creation and existence. To balance the desires to attract the “best and brightest” (Kapur and McHale, 2005) with any apprehensions toward the influx of foreigners and immigrants, countries implement selective skilled immigration policies that generally attract for entry yet prohibit permanent settlement. Recent trends show that this restrictive immigration stance have also been extended to international student migrants, who were previously viewed as future skilled human capital by their host countries.

Recent research and debates have raised questions about the ethics and politics of “skills” and “talent” in skilled migration policies (e.g., Liu-Farrer et al., 2020). Some scholars have highlighted the need to critically consider how axes of intersectionalities shape different skilled migration outcomes and experiences, as well as how inequalities and inequities have been inscribed into skilled migration policies (e.g., Boucher, 2021; Dodson, 2021; Raghuram, 2021). Another emergent research strand is the emergence of the migration industry that oils the global competition for skills (e.g., Baas, 2019; Cohen, 2021). As the war for talent intensifies, there is a need to understand and evaluate the roles that such a migration industry might play in facilitating as well as shaping skilled migration flows. Finally, the COVID-19 era has ushered in new trends concerning education, migration, and work. We need more systematic and comparative research in order to fully understand the impact of the pandemic for the global competition for skills.

Glossary

International higher education, geopolitics, cross-border mobility of students, liberal world order, China as an emerging power, decoloniality, soft power, International Relations.

Governments increasingly see international students as “a major contributor to (...) soft power” (House of Lords, 2014: 98), a key feature of the country’s “rayonnement international” (Perraton, 2014), as their “lifelong friends (...) in both spirit and deed” (DAAD, 2018: 3). In line with this political interest, scholars of international higher education (IHE) have started to pay more attention to the link between IHE and foreign policies. This contribution provides an overview of this emerging field of study and explores the different angles scholars take to examine the diplomatic dimension of IHE. I am particularly interested in how scholars account for power relations, and will show how the field would benefit from taking better account of the nature of global politics and the world order that has emerged since the Second World War. A more nuanced notion of power is pivotal for coming to grips with recent transformations of the global order. These changes put into question some of the conclusions drawn by scholars of educational diplomacy. Against the backdrop of my critique, I will outline an avenue the field could take with a view to developing a critical perspective that includes insights provided by decolonial studies.

Educating the elites

The emerging literature on educational diplomacy is characterized by diversity, with scholars exploring from different angles the link between international higher education and international relations, understood in a broad sense (Knight, 2019). Some studies relate educational diplomacy to transnational learning and highlight the importance of intercultural competences (Bayat, 2014). They focus on dialogue and the capacity to engage diverse participants in a social process (e.g., Özel, 2021; Bizzell et al., 2018). Other scholars foreground power in their analysis, some of them drawing on International Relations to highlight the link between global power and the role of education in socializing elites in countries of the South (Ikenberry and Kupan, 1990). At the center of these studies is the impressive number of heads of state who were educated in countries that are most influential in global politics. In 2018, 58 out of the 352 serving heads of state or government had been educated in the United States, 57 in the United Kingdom and 40 in France (Hillman, 2018).

The socialization of elites in other countries has a long tradition. It goes back to the British and French Empire that allowed the elites in their colonies to enroll in their universities (Pervillé, 1984). Interestingly enough this educational strategy was not applied to all colonies, as John Ikenberry and Charles Kupan show in their studies of the British Empire (Ikenberry and Kupan, 1990). They point out how the strategy was predominantly used in India and informed by an assimilation strategy. In a famous quotation Thomas Babington Macaulay, a British historian and Whig politician of the 19th century, underlined the importance of creating “a class of persons Indian in blood and color, but English in tastes, in opinions, in morals and in intellect. To that class we may leave it to refine the vernacular dialects of the country, to enrich those dialects with terms of science borrowed from the Western nomenclature, and to render them by degrees fit vehicles for conveying knowledge to the great mass of the population” (Macaulay, 1835 (1957)).

¹I would like to thank Fazal Rizvi, Stefano Guzzini and an anonymous reviewer for their comments on a previous draft. The intensification of our work has put peer review under enormous pressure. I am therefore especially grateful to them for taking the time to provide very substantial feedback that helped me to further develop my thoughts. The usual disclaimer applies.

This quotation also highlights the key role of the “colonial subjects” (Bhabha, 2004) in translating Western knowledge and its nomenclature into the different languages of the colonized. The one-directionality of the translation mirrors the power that helped establish English as a lingua franca (Ives, 2009). However, the act of translation also gives the translator some leeway. It requires important decisions since many terms are untranslatable, as Barbara Cassin’s monumental *Dictionary of Untranslatables* well documents (Cassin et al., 2014, see, also Syrotinski, 2019). Translators needed to be creative to overcome the incommensurability and to ensure that the translation made sense “in the vernacular dialects of the country”. This brings the agency of the colonial subjects to the fore and highlights the colonisers’ dependency on them to ensure their claim to power. The freedom of interpretation has increased with the independence of the former colonies. At the same time the education of the elites in the South by the dominant countries has gained further momentum, as the numbers already mentioned indicate. Scholars who reduce educational diplomacy to cross-border mobility of students are not able to account for this complex interaction between power and freedom that is at the center of the post-war global order, as I will show in the next section.

Diplomacy and the liberal world order

The term diplomacy, as we understand it today, is closely linked to an international liberal order that emerged in the 18th century in the aftermath of the Peace of Westphalia ending the Thirty Years’ War in 1648 (Milton, 2020). The end of the Cold War turned the liberal order, which used to be only hegemonic in the West, into a global one (Ikenberry, 2012). Taking a critical stance, Inderjeet Parmar suggests understanding this order as “imperialism by another name” (Parmar, 2018). However, putting the liberal order on an equal footing with imperialism without further qualification risks underestimating the complex relationship between freedom and dominance that is at the heart of the liberal world order.

International law and the rules of Westphalian system require all members of the society of states to renounce some of their liberty in return for a global order that gives them security and peace. Examples would be the prohibition of some types of weapons, or global trade regulations established by the World Trade Organization or regional institutions, both of which have major implications for the domestic level. At the same time the society of states acknowledges the exclusive sovereignty of individual states over their territory. This principle of sovereignty is still at the heart of today’s post-war order and enshrined in the United Nations Charter, which states that “nothing ... shall authorize the United Nations to intervene in matters which are essentially within the domestic jurisdiction of any state” (UN, 1945: 2(7)).

With increasing global dependence, the definition of what should be considered within a domestic jurisdiction has become increasingly difficult to determine. Diplomacy, which previously meant the prince’s authorization to travel, has become a key means to mediate the tension between global law and order and the sovereignty of the individual states. It is an “established method of influencing the decisions and behavior of foreign governments and peoples through dialogue, negotiation, and other measures short of war or violence” (Marks and Freeman, 1998).

In a liberal vein, some studies of educational diplomacy underline the importance of IHE in enhancing dialogue and negotiations with a view to increasing compliance with international norms and standards to enhance world peace and prosperity. They express the hope that university-to-student dialogue will help build trust, enhance knowledge transfer and reach development goals (Hone, 2014). This dialogue shall create “lifelong friends (...) in both spirit and deed” (DAAD, 2018: 3), as the German Academic Exchange Service put it in one of its documents. Conversely, a realist perspective foregrounds the great inequality between the different members of the society of states, with the United States claiming leadership since the rise of the Pax Americana after World War II.² However, the particularity of the liberal order, with sovereignty as one of its key pillars, makes it impossible for the leading country to just impose its will on other countries, notwithstanding its significant military and economic power. Ikenberry identifies key conditions that the United States need to fulfill to keep the global leadership they gained after World War II. They need to provide – or at least to be seen as providing – public goods in the area of security, and if possible in other areas (Ikenberry, 2012: 281). The second variable is “the ability of the United States to actually agree to reductions in its rights and privileges, sharing rule and authority” (282). This self-restraint on the part of the most powerful, or at least the perception of it, has become a vital incentive for other governments to accept the leadership of the liberal Leviathan, the US. The third variable that Ikenberry identifies is the willingness of other major states, including rising powers such as China and India, to operate within the liberal international order. They may seek to increase their stakes. As long as they accept the principles and values of the order, the global leadership of the US will continue. It is this third dimension of power that is at the center of educational diplomacy studies.

The Cold War and public diplomacy

The role of international higher education gained momentum with the broadening of diplomatic relations in the 1960s. Edmund Gullion, a US career diplomat, popularized the term public diplomacy for this transformation in 1965 (see Cull, 2020). This type of diplomacy no longer builds on exclusivity and secrecy but rather seeks to influence public opinion in other countries. Besides

²For a good overview on different notions of power that the different schools of International Relations have developed, see Guzzini, 2021. Power in World Politics, DIIS WORKING PAPER 2021: 17. Copenhagen: Danish Institute for International Studies..

education and cultural exchange, international broadcasting, and most recently social media have also become key channels in this context (Kukkola, 2018).

The rise of public diplomacy was closely related to the Cold War. Both East and West established international student and academic exchange and scholarship programmes to attract international students (see, e.g. Tsvetkova, 2008). In the 1970s, cultural exchange and cross-border mobility of academics and students came to be seen as a vital instrument to ease tension (*détente*) (Kremenyuk, 1995). The Helsinki Process played a vital role in this context, led by the Conference for Security and Cooperation in Europe (CSCE), with a view to facilitating the dialogue between East and West. The process culminated in 1975 in the Helsinki Final Act, signed by the Soviet Union, all European States and the United States. The act comprised a call for “a more exact assessment of the problems of comparison and equivalence of academic degrees and diplomas” (OSCE, 1975: 53). It was the United Nations Educational, Scientific and Cultural Organization (UNESCO) that was assigned the task of providing the legal instrument for this recognition regime geared to facilitating the exchange of students, teachers and scholars of all participating countries (Hartmann, 2015). The hope was to turn all of them into quasi-diplomats helping to mitigate the tension between East and West. The involvement of the US in this process was the main reason for including this country in the UNESCO definition of the European Region in 1976 (Daniel, 2003). Only a few years later, in 1978, the UNESCO Convention on the Recognition of Studies, Diplomas and Degrees in Higher Education was adopted (UNESCO, 1979). This historical legacy of the conventions is the reason for the geopolitical scope of the revised UNESCO convention, the Convention on the Recognition of Qualifications concerning Higher Education in the European Region, which was adopted in 1997 and became the main legal framework for the Bologna Process aimed at establishing a European Higher Education Area (Hartmann, 2010). The United States has not ratified the convention so far but is one of its signatory countries as they were also heavily involved in the drafting of the revised convention in the 1990s. The legacy of the Cold War on today’s geopolitical arrangements of cross-border mobility arrangements has received surprisingly little attention so far in IHE studies and is certainly worth further exploration.³ This study would also need to pay attention to scholarship programmes that have been in place for a long time, like the ones of the Ford Foundation for instance. It would be interesting to scrutinize whether the way how these programmes were informed by the geopolitical order of the Cold War still influences their set-up today.

The changing higher education landscape

The public diplomacy of IHE gained further momentum with a major increase in international students. Their number has risen from one million in the mid-1970s to over five million today (OECD, 2020). The liberal Leviathan, the US, has become the main destination in the post-war order and attracted 1,075,496 international students in the pre-pandemic year 2019/20 (Redden, 2020, for a historical account, see Bevis and Lucas, 2007). However, the number of new international students enrolling at US colleges and universities has been in decline in recent years.⁴ Australia has clearly benefited from this decline and managed to steadily increase its intake of international students in the pre-pandemic period, reaching 956,773 in 2019/20, with an average annual enrolments growth rate of 10.3% per year over the preceding five years (Australian Government, 2020). The rise of Australia as a major destination country in turn pushed the UK down to third place, with 538,615 international students in 2019/20 of which 73% were from non-EU countries.⁵ China has almost caught up with the UK in recent years, attracting 492,185 international students (see, eg. Marginson, 2018; Altbach, 2012; Hong, 2014; Wu, 2019; Rana, 2016). The rise of China indicates an important change in the geography of attraction. It mainly recruits students from Asia (60%) and much less from Africa (17%) and Europe (15%). France is close on China’s heels with 358,000 international students. Germany has become another key destination with 319,000 in 2019/20, a 6% rise in comparison to the previous year (DAAD, 2021: 60). But smaller emerging economies have also entered the global market. Malaysia, for instance, has undertaken major efforts to attract international students, in particular from Muslim-majority countries like the Gulf Region, in direct competition with Iran, a country that also seeks to recruit students from Malaysia (Banikamal and Ra’ees, 2018). We can thus identify some important geopolitical transformations in terms of attractiveness and an intensified competition between the countries (McGill Peterson, 2014). Prominent sending countries like China have also become important receiving countries (eg. Lo and Pan, 2021; Ham and Tolentino, 2018; Jain, 2020).

The diversification of attractiveness coincides with a broader geopolitical transformation of the global order with the rise of China as an economic and political power, followed by other emerging economies claiming more global weight, and the United Kingdom reimagining its global role after BREXIT (De Ville and Siles-Brügge, 2019; Kettle, 2020; Yu, 2019). But how exactly are global politics and international higher education interrelated? Is the increased competition between student destinations a reflection of broader political changes or does it trigger the transformation of the geopolitical order itself? The majority of contributions

³I am aware that geopolitics is a contested term, coined by Rudolf Kjellén and laying the foundations for the German *Geopolitik* (see, DODDS, K., KUUS, M. & SHARP, J. (eds.) 2013. *Introduction: Geopolitics and its Critics from: The Ashgate Research Companion to Critical Geopolitics*, London: Routledge.). It had been avoided therefore by scholars of International Studies for good reasons, to have a comeback only recently. My understanding of geopolitics draws on the perspective developed by Richard Ashley and his critical social theory of international politics. This perspective seeks to further develop a realist study of global power to overcome its narrow notion of power and to examine the creation of geographical and social space as well as borders (see, ASHLEY, R. 1987. *The Geopolitics of Geopolitical Space: Toward a Critical Social Theory of International Politics*. *Alternatives*, XII, 403–434).

to education diplomacy studies fail to address this pivotal question. They tend to assume that international students enhance the global power of the host country, rather than empirically examine the link. In the next section I will turn to contributions that scrutinize this link empirically and will discuss the insights they provide, as well as some of the shortcomings of this research.

The power of educational diplomacy

Educational diplomacy studies draw heavily on Joseph Nye's notion of soft power. Nye popularized the term to explore US influence in a post-Cold War world order characterized by a shift toward public diplomacy. Privileging a behavioral notion of power, he defines soft power as "the ability to affect others to get the outcomes one wants" (Nye, 2021: 197). At the center is a power that Max Weber describes as authority, or "the probability that a command with a given specific content will be obeyed by a given group of persons" (Weber, 1978: 52). This power contrasts with power as coercion, or "the probability that one actor within a social relationship will be in a position to carry out his own will despite resistance" (Weber, 1978: 53). There might be good reasons why people obey a rule. James Scott distinguishes between a thick and a thin notion of acquiescence (Scott, 1990: 72). In the first case people obey because they actively believe in the values underpinning the command and hence their subordination. They may do it because they have internalized the norms, or think they are in their own best interest. The thin notion of acquiescence comes into play where people comply out of resignation.

Transposing these ideas of power to the international level raises important questions given the nature of the international order and the leeway national states have, backed by the principle of sovereignty. Why should nation states deem norms and values established by the liberal Leviathan, the USA, and increasingly the EU, as so authoritative that they adhere to them even if they may be not in their interest? Why should they, as Amelia Hadfield puts it in her comparison of the soft power of the EU and the Commonwealth, "desire similar goals and outcomes to the initiating actor" (Hadfield, 2015:3)? Drawing on Robert Dahl's concept of power, Nye links soft power to the charm and charisma of A, which can convince B to do what A wishes (Dahl, 1957: 206). Accordingly, soft power is "the ability to get what you want through attraction rather than coercion or payment. It arises from the attractiveness of a country's culture, political ideals and policies" (Nye, 2004: 204). Global leadership thus depends not only on military and economic capacity but also on being seen as a model for the rest of the world. Nye refers to the combination of the two types of power as smart power. To convince other societies of the attractiveness of values and norms requires more than propaganda or public relations, he argues. "Simple propaganda often lacks credibility and thus is counterproductive as public diplomacy. (...) Conveying information and selling a positive image is part of it, but public diplomacy also involves building long-term relationships that create an enabling environment for government policies." (Nye, 2008: 101) This is a very important point, as it rejects a narrow notion of power that pays little attention to its relational nature. Studies that link the branding activities of a countries to educational diplomacy are at particular risk of conflating intention and effect (e.g. Raev and Minkman, 2020). There is no guarantee that the branding of a region or a higher education landscape will have the desired effects. It depends on how it is perceived at the other end.

More promising approaches explore whether study abroad increases students' appreciation of the host country's values and its claim to be a model for the world. Surveys and qualitative interviews have been widely used to determine such changes in students' minds (El-Nawawy, 2006). Many studies merely focus on the change in students' attitudes. However, a positive appraisal of the host country expressed by students on their return may simply reflect the great time the students had abroad, as Ane Bislev rightly points out (Bislev, 2017). It does not necessarily lead to more fundamental changes in terms of values. Other surveys seek to identify more fundamental value changes. Jian Guan and his research team examined changes in value between Chinese students who stayed at home and compared them to those who went abroad by using the Chinese Value Survey (Guan and Dodder, 2001). Their study shows rather mixed results. Some returning students had actually become more committed to their own culture instead of embracing US values and norms. Carol Atkinson identifies three factors that need to be in place in order to ensure that students embrace the host country's values and institutions. Firstly, they need to interact extensively with the host society. Secondly the international and domestic students and institutions need to develop a sense of community. Little interaction or negative experiences like racism can cause negative feelings toward the former host country. These two dimensions points out how the government's foreign policy depends on support from within its society to ensure the effectiveness of its strategy. This perspective brings the heterogeneity of actors involved to the fore. However, it continues underestimating the diversity of interests and issues at stake. Most studies assume that the host countries have one coherent IHE strategy in place. They fail to explore the extent to which ministries may differ in terms of the type of students they like to attract and, more generally, how closely they like to tie IHE to foreign policy goals. There might also be important differences between the strategy the government seeks to pursue in comparison to the one of the university associations. The third factor that determines the effectiveness of norm implementation according to Atkinson is the likelihood that the students obtain an influential position upon return. In other terms, the employability of international graduates back home influences the extent to which the values and norms of the former host country gain soft power (Atkinson, 2010: 2). This third factors cast lights on another kind of dependence of the host country; the economic development of the sending country. The employability of international graduates has indeed become a major concern in particular in the UK in recent years (e.g., HEPI, 2021; UUKI, 2020). It seems that the British government no longer trust that its culture, political ideals and policies are enough to further increase the number of international students in line with its 2019 International Education Strategy (HM Government 2019). But such increase does not come without risks.

A sign of power or vulnerability?

In 2019, a report published by an Australian think tank warned of the financial risks that an over-reliance on Chinese students entailed, only a few months before the Covid-19 pandemic forced the government to close the border (Babones, 2019). The worst-case scenario had become reality, triggering a major contraction of Australian higher education (Terry, 2021). Similar concerns about overreliance have been raised in other important destination countries since then. Many undergraduate courses in the UK are no longer financially viable without the revenue generated by international students, as the provost of University College London, Michael Spence, warned in summer 2021 (see Adams, 2021). In the United States, doctoral studies in particular have become dependent on the revenues generated by international students (Cantwell, 2015). In other words, a high number of international students may not necessarily be an expression of the country's global power (Rizvi, 2019). It may rather be an indicator of an important shift in economic power with major consequences for political leadership claims. The major branding activities may actually be a sign of these countries' awareness of their fragility rather than an expression of their power, in contrast to what some scholars have suggested (Lomer et al., 2018). The reason why educational diplomacy studies tend to ignore such signs of vulnerability is closely related to Nye's notion of soft power, as I hope to show in the next section.

Soft power as a category of practice

Todd Hall makes a strong case for soft power being more a category of practice than an analytical category (Hall, 2010). It has become a term that helps politicians to frame their international goals. The British House of Lords, for instance, set up a Select Committee on Soft Power and the UK's Influence in 2013 to discuss how the government could increase the country's soft power (House of Lords, 2014). In a recent reflection on the term, Nye expressed pride in the fact that his notion of smart power had been used by Hillary Clinton while she was Secretary of State (Nye, 2021: 204). A political consultancy and public relations agency, Portland, set up in 2001 by a former adviser to the former British Prime Minister, Tony Blair, has further popularized the notion by publishing regular rankings of countries' soft power.⁶ A number of other rankings of soft power have emerged since then (e.g., Brand Finance). In most of these rankings the Anglo-American countries score highly. Educational diplomacy studies that use soft power in an uncritical way risk becoming part of this propaganda strategy. At best they provide a justification for increasing the intake of international students, but at the price of losing their analytical power that is able to do justice to the complexity of educational diplomacy, the current transformation and the fact that it is always a two-way process. Only a few scholars have paid attention to how overseas students could also increase the soft power of the sending countries (see, e.g., Bislev, 2017: 88).

Toward critical geopolitics

I would like to conclude by identifying some avenues for future educational diplomacy studies that reduce the risk of reifying existing power relations. A first step would be to go beyond a state-centric perspective and to develop a more sophisticated understanding of power that not only enlarges the range of actors it pays attention to (e.g., Hartmann, 2021). It also seeks to highlight the complex relationship between intentions and effects of actions. Following Steven Lukes, we could understand power as a capacity: "(O)bserving the exercise of power can give evidence of its possession and counting power resources can be a clue to its distribution, but power is a capacity, and neither the exercise nor the vehicle of that capacity." (Lukes, 2005: 479) Some capacities may ensure that activities have the intended effect. However, actions can also trigger chains of unintended consequences. Not accounting for unintended consequences risks overestimating the capacity of a powerful actor to control a complex world. A case in point would be the fact that overseas students may also increase the soft power of their own countries.

We can further widen our understanding of the capacity by drawing on Susan Strange's notion of structural power that seeks to complement a behavioral notion of power (Strange, 1988: 29). Strange reminds us not just to explore who has the power, but also to examine its enabling conditions. Her notion of structural power highlights four closely interrelated dimensions, all of which have a close link to higher education and science in a broad sense. The first dimension is the ability to protect others from threats, or rather the perception of this ability. Ikenberry refers to this ability as public goods that the Leviathan must provide to gain leadership in a liberal world order (Ikenberry, 2012: 281). Strange's second structural power is the ability to produce. This dimension addresses issues of competition and the means of production and their ownership. A more critical perspective, drawing on Marx, would foreground the ability to make profits and exploit unpaid labour and nature more generally (Harvey, 2004). The third dimension that Strange identifies is linked to finance and, more precisely, the control of investments and credit. The fourth structural power is the capacity to develop, acquire and deny the access of others "to a kind of knowledge respected and sought by others; and whoever can control the channels by which it is communicated to those given access to it, will exercise a very special kind of structural power" (Strange, 1988: 31).

⁶<https://softpower30.com> [last accessed 1/11/2021].

Higher education and research play a vital role in this context. They create and disseminate knowledge that is relevant for all four dimensions. Drawing on Antonio Gramsci's theory of hegemony and Nicos Poulantzas' theory of the capitalist state we get, in addition, a sense of their mediation role (Hartmann, 2015, Gramsci, 1999 (1971): 217, Thomas, 2007). This perspective understands intellectuals as part of a hierarchical system that represents and mediates between different interests that are loosely associated with different social classes. The mediation by way of this system of intellectuals ensures that some of the allies' interests are included in the economic and political strategies of the ruling power, which in turn provides the strategies with the legitimation and soft power they need to be effective. Transposing this idea to the international level raises interesting questions as to how a global system of intellectuals might look like, the type of different interests they represent, the hierarchy between them, and the mediation they engage with. Drawing on critical geography we can understand the system of intellectuals as a specific social space (Ashley, 1987). It is this mediation role that I suggest putting at the center of educational diplomacy. The role of science and research and not only education suggest linking educational diplomacy to scientific diplomacy, a term that has gained in popularity in recent years (Turekian, 2018). Mediation takes place in all four dimensions that Strange identifies. Academics play a vital role in mediating knowledge that in turn supports different geopolitical claims of military and technological superiority. Although some of these mediations, notably where they involved scientific collaboration between Western and Chinese universities, have come in for criticism. A recent example is the US-Chinese scientific collaboration that caused a public outcry as a link to Chinese military manufacturers was suspected (Tylecote and Clark, 2021). But intellectuals also mediate significantly between theoretical concepts informing the organisation of the economy, investment, and credits, hence Strange's second and third dimensions, with important consequences for the world economy and its value chains. Most evident is the mediating role of universities and academics for Strange's fourth dimension of power; i.e. the capacity to develop, acquire and deny the access of others to knowledge. The interesting question is, of course, who indirectly benefits from the mediation, given the hierarchy built into the system of intellectuals. What are the consequences of the most recent effort of the European Union to strengthen academic freedom by making its respect a precondition for its funding of international scientific collaboration (European Parliament, 2018)? How do decolonial studies transform the hierarchy built into the mediation? These studies have gained momentum and attention in recent years. They highlight the inequalities built into academic knowledge creation, as well as the access to it and empower new types of knowledge, often framed as local or indigenous knowledge (see, e.g., Santos, 2014; Connell, 2007; Mignolo, 2021).

Examining the role of higher education and academic knowledge for international relations is thus a very topical endeavor. However, it requires a broader analytical perspective than most educational diplomacy studies offer to gain a better understanding of the mediation between different ways of knowledge and reality definition. Without strengthening its analytical power, the field of research risks becoming part of the host countries' propaganda, as I have argued in this contribution.

Introduction

Populism—a “vague” term referring to political practices that polarize society into two opposite groups, the elite and the people—very often functions as a “dirty” word to disqualify others. Many politicians including Donald Trump (former United States President), Boris Johnson (United Kingdom First Minister), Hugo Chavez (former Venezuela President) or Narendra Modi (Indian Prime Minister) have been described as populists often in an attempt to compromise their public image. Populists are told to be insincere and manipulative, and their supporters are portrayed as ignorant or low educated. Thus, the question of populism often has triggered educational debates. Education (or its lack) has been seen as both a cause and a solution to populism.

However, political and educational theory and research provide a far more nuanced image of populism. The question of populism is indeed very contested. There is no clear answer to what populism is, how populism relates to education and whether education should somehow react to the rise of populist leaders. This article will interrogate different controversies associated with populism and its relation to education: (1) what is populism?; (2) who are the “populists”?; (3) is populism a democratic threat?; (4) is populism a consequence of an educational failure?; (5) should education struggle against populism? and (6) should education learn from populism? This paper aims to shed light on populism and its implications for education.

What is populism?

There is no agreement on what populism is. In the introduction of this article, I defined populism as a vague term referring to political practices that polarize society into two opposite groups, the elite and the people, where the people are considered the source of democratic legitimacy. In populism, the will of the people is deemed to be preferable and non-negotiable. I suspect this definition could be shared among most of those studying populism. However, outside this generic definition, political scientists disagree with practically everything else.

Some academics argue that “the people” of populism is always a homogeneous and anti-pluralist group. According to Müller (2017), the key populist feature is their intention to destroy their enemies so only “the people have access to power. Others, in contrast, explain that “the people” can be heterogeneous providing they are united in a cause. Analyzing the case of SYRIZA in Greece, Stavrakakis and Katsambekis (2014) argue that, for populism to exist, the people only need to be united in their political struggle against the elite.

Some authors argue that populist movements always display authoritarian and charismatic leadership, and the leader presents themselves as the one who unites the people and represents its true nature (Weyland, 2017). This perspective is, nevertheless, challenged by many (see. e.g., Moffitt and Tormey, 2014). Most political scientists appear to agree that there are too many examples of populist movements (e.g., Tea Party in the United States; BREXIT in the United Kingdom) without a clear leader.

A key issue is whether populism is always right-wing orientated. Some argue that populism tends to be associated with extreme-right ideologies that show no consideration for those who do not belong to the majoritarian ethnic group (Müller, 2017). Such is the case, for instance, of Marine Le Pen in France or Pauline Hanson in Australia. This explanation also triggers associations between populism, fascism and Nazism and favors the pejorative use of the term populism. However, this perspective is highly contested; there is a wide range of left-wing populists who openly challenge xenophobia and racism (e.g., Pablo Iglesias; Evo Morales; Bernie

Sanders). Many argue that populism is very often combined with other ideologies. This is why we can have right-wing and left-wing populists. In some cases, populism is combined with nativism and/or racist attitudes resulting in right-wing or far-right-wing populism. In other instances, populism is combined with social-democratic values resulting in left-wing or far left-wing populism (Mudde and Rovira Kaltwasser, 2017).

The final disagreement relates to the performative style portrayed by populists. According to Ostiguy (2017), populists always present themselves as outsiders, challenge political and social correctness, and favor ordinary individuals' lived experiences over technical and academic expertise. However, while this perspective clearly defines some populist leaders such as Thaksin Shinawatra in Thailand or Abdoulaye Wade in Senegal, it does not define them all. Alexis Tsipras (SYRIZA leader), Preston Manning in Canada or Alberto Fujimori in Peru responded to more conventional political behaviors, and Pablo Iglesias (former Spanish Vice-President) is an academic himself.

Who are “the populists”?

It is complicated to find out political leaders or movements who are unanimously defined as populists. As the term populism is often used pejoratively, those defined as populist tend to deny such accusations or pass the label of populist to someone else. Michael Gove, former secretary of education in the United Kingdom very often described by the press as populist, once congratulated his country for getting rid of populist parties.

The word “populist” does not have the same connotations across time and space. Populism derives from the Latin *populi* (people), term that encompassed three different meanings: the people holding political power, the people as the nation, and the “common people” (in opposition to the ruling elite) (Canovan, 2004). Besides, in languages such as English, “the people” also can be used as synonymous of humanity. The way we understand populism is highly conditioned by our linguistic, cultural, and historical context.

Political scientists, nevertheless, tend to agree that the first manifestations of “modern” populism can be tracked to 19th century Russia. The *narodniki* was a group of young urban students who romanticized the countryside and tried to mobilize its peasants to overthrow the Tsar regime (Rovira Kaltwasser et al., 2017). Just a few years later, in 1890s United States, the People's Party became relatively successful in the rural Southern and Western states with a discourse against the corruption of Washington politics, the manipulation of the press, and the economic inequality between “paupers and millionaires” (cited in Laclau, 2007, p. 201).

Not without controversy, empirical research suggests that there have been manifestations of populism across the different continents. In Asia, Prime Minister of Thailand Thaksin Shinawatra (2001–2006) gained support from rural poor, styling himself as a man “of the people”, wearing informal clothes, and talking about his sex life in local slang (Moffit and Tormey, 2014). Indian Prime Minister Narendra Modi (2014–) is often defined as the Asian populist *par excellence*. Modi extensively uses social media and presents Hindu people in cultural opposition to the English-speaking, Westernized and secular elites (Rao, 2018).

In Australia and New Zealand, two politicians are more often described as populists. Pauline Hanson, the extreme right Australian One Nation Party, repeatedly appeared in reality shows presenting herself as a “fish and chip shop lady” and complaining against Asian immigration, multiculturalism and aborigines' rights (Moffit and Tormey, 2014). In New Zealand, Winston Peters secured political power as Deputy Prime Minister and Treasurer (1996–1998) and Minister of Foreign Affairs (2005–2008) (Moffit, 2017) with a discourse against intellectual elites and immigrants.

Africa has seen different populist waves. According to Resnik (2017), African populism was initially connected to the *coups* in the 1980s where different military figures such as Captain Thomas Sankara in Burkina Faso (1983–1987) and Flight Lieutenant Jerry Rawlings (1981–2001) in Ghana orchestrated “popular” revolutions against civilian governments defined as corrupted elites. More recently, others have capitalized the continent's economic and demographic changes, particularly the increasing urbanisations and inequality experienced by African youth. For instance, in Senegal, Abdoulaye Wade obtained the Presidency (2000–2012) after having been proclaimed *Président de la rue* (“President of the street”)—label he gained through campaign rallies in which he aligned himself with the poor in opposition to the political elite.
